'The catch lies in the discrepancy between that element of indeterminability—both of situations and of *terrain*—which is inherent in War as a practical art, and the inelasticity of the phalanx, which in practice can only do itself justice in one particular situation and on one particular kind of *terrain*. Of course, if, whenever it was a question of a decisive engagement, the enemy were under compulsion to accept the situation and the *terrain* that happen to suit the phalanx, then presumably the employment of the phalanx would be an infallible talisman of victory. But if it is in fact always possible—and easily possible—for the enemy to decline battle on these terms, then the phalanx-formation ceases to be formidable.

'Moreover it is admitted that the phalanx requires a *terrain* which is level and clear and innocent of any such obstacles as ditches, outcrops, ravines, crags and water-courses—any of which are quite enough to throw it out of step and to dislocate its formation. It will also be admitted on all hands that the kind of *terrain* which the phalanx requires—a *terrain* innocent of obstacles over a stretch of two thousand yards and upwards—is almost impossible to find, or is at any rate exceedingly rare; and, even supposing that it has been found, it is always possible, as we have pointed out, for the enemy to decline battle . . . [or, if he does accept battle with the phalanx on level ground, the enemy can still always secure the victory by keeping part of his own force in reserve, engaging the phalanx with the rest of his force just so far as to loosen the phalanx's formation and cause it to expose its flanks, and then throwing his reserves against the flanks or rear of the phalanx when these are no longer covered by light infantry and cavalry].¹ In short, the situations that are in favour of the phalanx can be easily evaded by the enemy, whereas the phalanx cannot evade the situations that tell against it; and, if the facts as I have stated them are true, this is manifestly an enormous handicap.

'Moreover a phalanx, like any other force, has to march through all kinds of country, to encamp, to forestall the enemy in occupying key-positions, to conduct and undergo sieges, and to encounter unforeseen emergencies. All these operations—which are part and parcel of War—are apt to be influential, and are sometimes decisive, in determining the issue. And for all such operations the Macedonian military technique is clumsy, and sometimes entirely ineffective, because it does not permit the phalangite to do himself justice either in the ranks or as an individual. On the other hand the Roman military technique is effective for all these operations alike, because every Roman soldier, once under arms and on duty, is equally well adapted for dealing with every kind of *terrain* and situation and emergency; and not only so, but he is also equally in his element, and equally master of the situation, whether he is called upon to take part in a general or in a partial engagement, or to go into action by companies, or to carry on individually. It will be seen that

¹ The passage between brackets is a précis of the corresponding passage in the original.—A.J.T.

the Roman fighting-machine is enormously superior to its rivals in its efficiency in detail, and it is therefore only natural that the Romans should be enormously more successful than their adversaries in attaining their military objectives.¹

This versatility, which was the characteristic feature of the full-fledged Roman military genius, made the integration of the skirmisher with the hoplite complete; for the mobility of the one and the irresistibility of the other were now combined in the person of every legionary; and when the legion, after having been evoked by Hannibal and employed, with destructive effect, against the antiquated Macedonian array, had been perfected in the Roman anti-barbarian and civil wars by a series of great captains beginning with Marius and ending with Caesar, it had attained the greatest efficiency which was possible for infantry before the invention of firearms.² At the very moment, however, when the legionary was becoming perfect after his own kind, he received the first of a long series of defeats from a pair of mounted men-at-arms with utterly different techniques—the light horse-archer³ and the mail-clad lancer or cataphract⁴—who between them were eventually to drive the legionary

¹ Polybius, Book XVIII, chaps. 29–32, apropos of Titus Quinctius Flamininus's victory over King Philip V at Cynoscephalae in 197 B.C. The same contrast has been described in the following terms by a modern Western scholar, Dr. Georg Veith:

'The Greek was at all times conscious of his own limitations in the sphere of military capacity; hence his tendency towards specialization, in an effort to bring to the highest perfection—even at the cost of one-sidedness—the relatively little of valuable military material that the individual Greek possessed in himself. This was the origin of the manifold distinctions of special troops within each of the arms, and of that peculiarly characteristic mark of the Greek art of war: an evolution whose line of progress was from the simple to the complex, and which pushed the specialisation of equipment to the farthest limits. (This evolution reached its highest point under Alexander the Great, which was also the moment when the whole Greek art of war was at its zenith.) Conversely, among the Romans we find—as an ideal which was thoroughly attainable and was also actually attained—the soldier in himself, who, in his soldierly capacity, has to be—and duly is—available in equal measure for every kind of special employment. The logical consequence is a development, in the Roman art of war, from a differentiation—which is to be found, here too, at the beginning—to a parity of importance as between the different arms and equipments, and thence to a principal force which is homogeneous through and through (the always indispensable special weapons sinking to the status of subsidiary weapons in the hands of foreign formations). Thus the Greek evolution from the simple to the complex finds its contrast in a Roman development from the complex to the simple; and this simple instrument attains, in virtue of its very simplification, a perfection which renders it capable of at least as great a versatility in its employment as was within the reach of the complicated Greek army of the Macedonian period and the Age of the Diadochi.'—Kromayer, J., and Veith, G.: *Heerwesen und Kriegführung der Griechen und Römer* (Munich 1928, Beck), p. 3.

² For this chapter in the history of the evolution of the legion see III. C (i) (b), vol. iii, p. 166, above.

³ The light build of the horse-archer's (in contrast to the cataphract's) mount is conveyed in the representation on a coin struck by the Roman general Labienus (see *The Cambridge Ancient History*, Plates, vol. iv, plate facing p. 8, fig. [o]).

⁴ The heavily armed cavalryman or cataphract, like the heavily armed infantryman or hoplite, was perhaps an Assyrian invention—the hoplite being in that case the earliest and the cataphract the latest creation of the Assyrian military genius. At any rate, our first evidence for the existence of the cataphract is the portrayal of a rudimentary representative of the type on Assyrian bas-reliefs of the 7th century B.C., where he appears side by side with the heavily armed charioteer. Since these reliefs are later in date than the irruption of the Cimmerian and Scyth Nomads into South-Western Asia (see II. D

440 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
off the field *à la débânde*. The victory of the horse-archer over the legionary at Carrhae in 53 B.C. forestalled, by five years, the classic combat of legionary against legionary in 48 B.C. at Pharsalus, a battle in which the Roman infantry technique was probably at its zenith.¹ The omen of Carrhae was confirmed, more than four centuries later, at Adrianople, where the cataphract gave the legionary his *coup de grâce* in A.D. 378.²

The disaster at Adrianople, which was the tragic end of an ascendancy that the legionary had retained—albeit with increasing difficulty—for nearly six hundred years, has been vividly described by a contemporary Roman officer who was also a Latin historian.³

On the eve of this catastrophe the confidence of the Roman high command in the traditional Roman military technique was still so overweening that the Emperor Valens, who had just succeeded in making contact with the Gothic host that was then ravaging the Roman territory of Thrace, insisted on administering immediate punishment to the refractory barbarians.⁴ He would not wait for

(v), vol. ii, p. 136, above), we may conjecture that the Assyrians were inspired to take this first step towards the creation of the cataphract by their encounter with these horse-archers from the Eurasian Steppe. Assyria, like the Sinic World, probably derived the art of riding from this Eurasian source (see III. C (i) (b), vol. iii, p. 167, footnote 1, above), and, *a fortiori*, the art of using the bow on horseback—just as, some twelve hundred years earlier, the neighbours of Eurasia had been initiated, through a previous eruption of Nomads, into the art of chariotry (till then unknown to the sedentary societies, as was, indeed, the horse itself). The Assyrians' reaction to their encounter with the Nomads seems to have been to combine the Nomads' archery-on-horseback with the Assyrian heavy infantryman's defensive armour. In the Achaemenian Age a *cap-d-pie* suit of armour was worn on horseback by the Persian grandee Masistius at the Battle of Plataea in 479 B.C. (see Herodotus, Book IX, chap. 22). The Achaemenidae would also appear to have made a start in armouring the war-horse as well as his rider, *teste Xenophonte* (*Anabasis*, Book I, chap. 8, § 7; *Cyropaedia*, Book VI, chap. 1, §§ 50-1, and chap. 4, § 1; Book VII, chap. 1, § 2; *De Re Equestri*, chap. 12, § 8). From the Achaemenian Empire a fighting-machine which was thus perhaps of Nomadic inspiration was borrowed back—with the improvement of armouring both rider and horse—by the neighbouring Nomads on the border of the Steppe between the Pamirs and the Caspian. The Massagetae, for instance, are described by Herodotus (Book I, chap. 215) as armouring their horses in the fashion that is ascribed by Xenophon to the Achaemenian cavalry. In this Nomad incarnation the cataphract then moved back south-westwards with the Parni who founded the Parthian Empire (see II. D (vii), vol. ii, p. 371, footnote 2, and II. D (vii), Annex V, vol. ii, p. 435, footnote 1), and north-westwards with the Sarmatians, who passed the cataphract on to the Goths when the Goths trespassed upon the great gulf of the Eurasian Steppe between the Black Sea and the northern forests. It was the Parni who made it technically possible to complete a process which the Assyrians appear to have first set in motion. On the pastures of Media they bred a horse of such size, strength, and elegance that he could bear the weight of a complete suit of armour for himself as well as for his rider (see Tarn, W. W.: *Hellenistic Military and Naval Developments* (Cambridge 1930, University Press), pp. 76-83; eundem: *The Greeks in Bactria and India* (Cambridge 1938, University Press), pp. 308-10). This Parthian full-fledged cataphract is portrayed in a *graffito* at Dura (see *The Cambridge Ancient History*, Plates, vol. iv, plate facing p. 26, fig. [c]). The Parthian cataphract helped the Parthian horse-archer to defeat the legionary at Carrhae in 53 B.C.; the Gothic cataphract confirmed his defeat in A.D. 378 at Adrianople.

¹ The Age of Caesar marks the 'qualitativen Höhepunkt des römischen Kriegswesens' according to Kromayer and Veith, *op. cit.*, p. 251.

² For the annals of the secular duel between the legionary and the cataphract see III. C (i) (b), vol. iii, pp. 164 and 166, above.

³ Ammianus Marcellinus: *Res Gestae*, Book XXXI, chaps. 11-13.

⁴ The Goths had been given passage across the Lower Danube by the Roman author-

the reinforcements which his nephew and colleague Gratian was bringing by forced marches from the west, though he had received dispatches announcing that Gratian's army was now on the point of joining hands with his;¹ and he would not entertain the overtures which the Goths—disconcerted at having evoked so strong a Roman military reaction—were belatedly attempting to make to their indignant Imperial adversary. Valens gave the order for his legions to march at once upon the Gothic lager; and at first sight it seemed as though his intransigent policy were justified by its effect. 'The terrifying din of [the legionaries'] clashing arms, and their aggressive drumming on their shields, so intimidated the barbarians—who were also weakened by the absence of a part of their host which was operating at a distance under the command of Alatheus and Saphrax, and had not yet had time to return, though the order was on its way to them—that they sent *parlementaires* to ask for peace.' It looked as though the legions had won their victory without having had to strike a blow; but in reality Valens' intransigence had not broken the Goths' spirit but had inspired them with the courage of despair; and the parley was a feint.

The purpose of the Gothic commander Fritigern was simply to gain time until he could take up the Roman challenge with his whole force—including the absent corps, which consisted of the heavy cavalry—and his ruse was successful; for he managed to draw the parley out—while the Romans stood to arms, without food or water, through the heat of the day—until 'the Gothic cavalry, reappearing on the scene with Alatheus and Saphrax at its head, and stiffened by a contingent of Alani,² burst upon the Roman

ities, at the Goths' own request, out of the *cul-de-sac* in which the great western bay of the Eurasian Steppe comes to an end between the Lower Danube and the Carpathians, and they had been allowed to settle, as *foederati* of the Empire, on Roman territory between the Danube and the Balkan Range. In intention and in principle this had been a friendly act, since the Goths, in the *cul-de-sac* which had been their previous home, were threatened with annihilation by the eruption of the Huns from the heart of the Steppe beyond the Volga and the Yaik. The arrangement between the Gothic refugees and the Roman authorities ought to have proved mutually beneficial, since the refugees, in finding an asylum on Roman soil, might have been expected to become a bulwark of the Empire against the assaults of the common Hun enemy. Unfortunately the execution of the agreement was at once followed by friction; and the blame for this was largely on the Roman side, since the minor officials of the Imperial administration seem to have regarded their Government's generous policy towards the Goths as an opportunity for fleecing and bullying the refugees on their own account. In any case, wherever the fault lay, the Goths broke with the Imperial Government and began to pillage the country-side on which they had been settled as friends and allies of the Empire. And, not unnaturally, this behaviour was hotly resented by the Roman authorities, in whose eyes it was not only flagrant treason but was also base ingratitude.

¹ Valens' impatience is put down by Ammianus to his jealousy of Gratian and his consequent determination to keep all the Gothic laurels for himself. His decision to go into action at once was taken against the advice of his *Magister Equitum* Victor: 'Sarmata, sed cunctator et cautus.'

² The Alani were one of the hordes of those Sarmatian Nomads upon whose pastures the Goths had intruded when they broke out of the northern forests into the great western bay of the Eurasian Steppe. The eruption of the Huns from the heart of the

army as a thunderbolt bursts against a mountain-range, charged at lightning speed, and swept away, in a whirlwind of slaughter, as many of the Roman troops as it managed to engage at close quarters'. The legionaries were thrown out of their formation and were herded together into so dense a mass that they had no longer any room to wield, or even draw, their swords; and in this helpless plight they suffered the fate which their own predecessors had once inflicted on the Macedonian phalangites. Having caught the legionaries at this irretrievable disadvantage, the cataphracts pressed home their attack without giving their discomfited opponents a chance to rally, until 'at length, under the weight and "drive" of the barbarian offensive, the Roman line gave way, and the legionaries—driven to the last resort in a desperate situation—took to their heels in a chaotic *sauve qui peut*'. The historian vouches for the fact that 'the Roman casualties amounted to about two-thirds of the effectives engaged' (the Emperor Valens himself was among the missing); and he expresses the opinion that, 'apart from the Battle of Cannae, there' was 'no record, in all the annals of Roman military history, of any other action in which the carnage was so great as this'.

In measuring Adrianople by Cannae, Ammianus gives proof of his historical insight, for it was the slaughter at Cannae, where the Roman infantry had been at the mercy of Hannibal's heavy cavalry, that had stimulated the Roman military genius into transforming a clumsy phalanx on the old-fashioned Spartan model into the mobile legion which had been victorious first at Zama and then at Cynoscephalae and Pydna. In the year of Adrianople, however, the lesson of Cannae was nearly six hundred years old; and during those six centuries the Roman legionaries had 'rested on their oars', like the Macedonian phalangites before them,¹ until they allowed themselves to be overtaken and ridden down by an Oriental heavy cavalry which was a more formidable engine of war than Hannibal's

Steppe had now blown Sarmatians and Goths, pell-mell, out of Nomads' land into the Roman Empire. It was from the Sarmatians, as we have seen (p. 439, footnote 4, above), that the Goths had acquired the technique of the cataphract.

¹ This Roman repetition of a Macedonian story of degeneration in military technique appears to have been remarkably close. The Macedonian phalangite, who had won his triumphs over his Theban adversary by combining a longer range of weapon with a superior mobility (see IV. C (iii) (c) 2 (γ), Annex, p. 636, footnote 3, below), had eventually succumbed to the Roman legionary because, in the meantime, he had sacrificed mobility to massiveness (see the present chapter, pp. 434-5, above). On the evidence of Arrian's *Ἐκταῦς καὶ Ἀλάνων* (A.D. 136), a modern Western scholar (Parker, H. M. D.: *The Roman Legions* (Oxford 1928, Clarendon Press), pp. 248-9 and 258-60) has conjectured that in the legions (as distinct from the auxilia) the Roman Army was relapsing, as early as the second century of the Christian Era, from the mobile manipular formation into the unwieldy Theban-Spartan formation to which the Roman infantry had reverted once before with such disastrous consequences at Cannae (see p. 436, footnote 3, above). On this point see also Darkó, E.: 'Influences Turaniennes sur l'Évolution de l'Art Militaire des Grecs, des Romains et des Byzantins' in *Byzantion*, vol. x (Brussels 1935), p. 459.

European squadrons, and which could not be coped with effectively without some fresh innovation in infantry technique. The effective innovation was discovered in the end, but not for a thousand years, and then not by Roman wits. Though the Romans had received repeated warnings of the legionary's inferiority to Oriental cavalry—in Crassus's disaster of 53 B.C. and Valerian's of A.D. 260 and Julian's of A.D. 363—they had not been stimulated to make any fresh creative advance in infantry technique. They had left the legion, unreformed, to its fate; and when 'the knock-out blow' was duly delivered in the fullness of time in A.D. 378 at Adrianople, they could think of no more original remedy than to discard the defeated legionary outright and to take over the victorious cataphract at second-hand.¹ Gratian's colleague and successor, Theodosius, rewarded the barbarian horsemen for having annihilated the Roman infantry by hiring them to fill the vacant place; and, even when the Imperial Government had paid the inevitable price for the brief respite that was purchased by this short-sighted policy, and had seen the mercenary barbarian troopers partition all its western provinces into barbarian 'successor-states', the new native army,² which saved the Greek and Oriental provinces, at the eleventh hour, from going the same way, was armed and mounted on the barbarian pattern.³

¹ See III. C (i) (b), vol. iii, p. 164, above.

² For the creation of a new native army by the Roman Government at Constantinople in the course of the fifth century of the Christian Era see IV (iii) (c) 2 (B), pp. 324-5, above.

³ See the description—given by Procopius of Caesarea in *A History of the Wars of Justinian*, and quoted in this Study in III. C (i) (b), vol. iii, p. 163, above—of the cataphracts who were Belisarius's instrument for the reconquest of Africa and Italy in the sixth century of the Christian Era. The arm already existed in the Roman Army, even before the disaster of A.D. 378 raised the cataphract's prestige to the skies and reduced the legionary's prestige to zero. At the battle of Adrianople itself, after the legions had given way, the Emperor Valens took refuge with the two heavy-cavalry regiments of Lancearii and Mattiarii, 'qui, dum multitudo tolerabatur hostilis, fixis corporibus steterant inconcussi' (Ammianus, op. cit., Book XXXI, chap. 13); and before that, in the Imperial bodyguard which had accompanied the Emperor Constantius on his state entry into the city of Rome in A.D. 356, there had been 'a sprinkling of cataphract cavalymen, popularly known as *clibanarii*' [i.e. 'hard-ware boys' or 'men in ironmongery', from *clibanus*, which was the Greek word for an iron baker's-oven], of whose accoutrements Ammianus (op. cit., Book XVI, chap. 10) gives the following description: 'Their persons were protected by being cased in cuirasses and swathed in metal hoops which gave them the appearance of being not so much men of flesh and blood as statues brought to a fine finish by the hand of a Praxiteles. Their armour consisted of thin loops of metal plating which were adjusted to the curves of the body and which not only encircled the trunk but were also carried down all the limbs with such skill that, whatever bodily movement the trooper might require to make, his metallic integument would conform to it by adjusting itself at the joints—and this without exposing any gaps.' Evidently the Roman armourers of the fourth century of the Christian Era had borrowed from the Sarmatians the idea of a heavy cavalryman armed *cap-à-pie*, and had then translated the Sarmatian scale-armour into the hoop-armour which was already being worn, at the turn of the first and second centuries, by Trajan's legionaries (both the Roman legionary's hoop-armour and the Sarmatian cataphract's scale-armour are portrayed in the bas-reliefs on Trajan's Column). The hoop-armour of the legionary was confined to shoulder-pieces and corselet; but the more difficult art of encasing, without impeding, an arm or a leg had been worked out on the gladiatorial arena in the armament of the *secutor*. A combination of the *secutor* with the Trajanic legionary gives the fourth-

The ignominy of the legionary's end is accentuated by the strange fact that the cataphract who rode him down on the plains of Thrace in A.D. 378 was himself a degenerate. The Parthian cavalryman who had forced Crassus's legions to capitulate at Carrhae in 53 B.C. had been a horse-archer, like his native Nomad prototype; the Sarmatian and Gothic cataphracts who annihilated Valens' legions at Adrianople were mere lancers¹ who won their victory by the crude and clumsy method of charging home, in substitution for the refined technique of overwhelming their enemy—in the manner of the Suren's horse-archers at Carrhae in 53 B.C.—with a ceaseless discharge of arrows supplied by a never-failing camel commissariat.² Carrhae 'ought to have revolutionized the World's warfare; but in fact it produced little effect, for Surenas was put to death next year and his organization broken up'.³ The future lay not with the light horse-archer but with the cataphract, who had been represented at Carrhae in the Parthian ranks⁴ without making any notable contribution to the brilliant victory of his unarmoured comrade. And the cataphract had no sooner put on the Assyrian infantryman's armour than he had begun to discard the Nomad's bow for the hoplite's lance. The rudimentary Assyrian cataphract still remained a horse-archer; and a force of a thousand Sakas who fought for the last of the Achaemenidae at Gaugamela in 331 B.C. are described as still being equipped with bows⁵ though

century *clibanarius* when the 'hard-ware boy' is mounted on a horse—as he must be if he is to move! (The *clibanarius*'s mount seems to have been as heavily armoured as his rider, to judge by another description, which carries our evidence for the existence of this type of heavy cavalryman in the Roman Army back to the time of Constantius's father Constantine the Great. 'Men and horses alike are encased in a covering of iron. The name that they go by in the Army is *clibanarii*. The men are not only armour-clad themselves; the horses, too, on which they are mounted, have their chests protected by a cuirass that reaches from their heads right down to their legs and makes them proof against the danger of being wounded without hampering their gait' (Nazarius: *Panegyricus Constantino Augusto Dictus*, chap. 22, in Baehrens, G.: *XII Panegyrici Latini* (Leipzig 1911, Teubner), p. 173).) A combination (see Darkó, op. cit., in *Byzantion*, vol. x (1935), p. 466) of the defensive armour of the *clibanarius* with the missile-weapon of the light-armed horse-archer (who was both an older and a longer-lived type of Nomad cavalryman than the heavy-armed lancer) gives the sixth-century Roman cataphract. This re-equipment of the *ci-devant* Nomad heavy cavalryman with the original Nomad weapon which the cataphract had abandoned in favour of the lance (see p. 444, above) was the last stroke of the Roman military genius—unless it was merely a Roman mimesis of a compromise between the Scythian and the Sarmatian equipment which had been worked out, five hundred years earlier, on the Cimmerian Bosphorus (see p. 445, footnote 8, below). We catch a last glimpse of this later Roman cataphract in the *Τακτικά*, attributed to the Emperor Maurice (*imperabat* A.D. 582–602), which, according to Darkó (op. cit., in *Byzantion*, vol. xii (1937), pp. 121–4), was perhaps really written by Maurice's successor Heraclius during his retirement (see III. C (ii) (b), vol. iii, p. 269, footnote 4, above) in the winter of A.D. 621–2. According to the same Hungarian scholar (op. cit., vol. cit., p. 128) the Roman cavalry equipment described in this treatise was modelled on that of the contemporary Avar Nomads.

⁵ Arrian: *Alexandri Anabasis*, Book III, chap. 8, § 3.

the horses as well as the men were armoured.¹ When they went into action, however, these Saka *de.ni*-cataphracts did not shoot; they charged.² And the Parthian full-blown cataphract who is portrayed in the *graffito* at Dura³ does not even carry a bow in addition to his lance. Notwithstanding the success of the light horse-archer against Crassus at Carrhae, the failure of the charging cataphract against Ventidius in the next round of this Romano-Parthian trial of strength,⁴ and the renewed success of the light horse-archer against Mark Antony,⁵ the Parthians opted for the cataphract;⁶ and the Arsacids' example was followed by their successors the Sasanidae. It is true that Belisarius's sixth-century Roman cataphracts, as Procopius describes them,⁷ were horse-archers of the Assyrian kind; but in general it was the armoured lancer, and not the armoured horse-archer, who kept the saddle for the next twelve hundred years after the light horse-archer's victory at Carrhae; and there is an extraordinary uniformity in this lancer's accoutrements over a Time-span of more than a millennium and across the length and breadth of Europe and Asia. His identity is unmistakable, whether the portrait in which he presents himself to us happens to be in some fresco, dating from the first century of the Christian Era, in a Crimean tomb;⁸ or on the third- and fourth- and fifth- and sixth-century bas-reliefs of Sasanian kings in Fars; or in the clay figurines of those Far Eastern men-at-arms who were the fighting-force of the T'ang Dynasty (*imperabant* A.D. 618-907);⁹ or in the eleventh-century tapestry at Bayeux which depicts the defeat of the antiquated English foot-soldiers of the day by King William the Conqueror's Norman knights.¹⁰

⁵ Tarn in *op. cit.*, vol. cit., pp. 71-5.

⁶ This discomfiture of the light horse-archer by the heavy-armed lancer on his native pastures is reflected in the history of the Hellenic mimesis of the Nomadic military technique. In the fourth century B.C. Alexander the Great, when he arrived at the Transoxanian fringe of the Great Eurasian Steppe, took to mixing light native horse-archers with his own Macedonian heavy cavalry; and more than four hundred years later the Roman Emperor Hadrian (*imperabat* A.D. 117-38), in his turn, introduced light horse-archers into the Roman Army (Arrian: *Τέχνη Τακτική*, chap. 44). On the other hand the Roman cavalry of the Emperor Gallienus (*imperabat* A.D. 253-68) were mostly not horse-archers but heavy lancers who were presumably the prototypes of the fourth-century *clibanarii* (see p. 443, footnote 3, above) of the Emperors Maxentius, Constantius and Valens. (For these facts see Darkó, *op. cit.*, in *Byzantion*, vol. x (1935), pp. 452-3, 460 and 462.)

⁷ In the passage already quoted in this Study in III. C (i) (b), vol. iii, p. 163, above.

⁸ See Rostovtzeff, M.: *Iranians and Greeks in South Russia* (Oxford 1922, Clarendon Press), pp. 121, 129, and 169. The Bosphoran knight of the first century, like the Roman man-at-arms of the sixth (see p. 443, footnote 3, above), put on the Sarmatian cataphract's armour without throwing aside the Scythian *hippotoxotes*' bow.

⁹ See Rostovtzeff, *op. cit.*, pp. 203-4, or, still better, any collection of T'ang figurines.

¹⁰ The Time-interval of nearly seven centuries that separates the Battle of Hastings from the Battle of Adrianople is an illustration of the fact that in the realm of human affairs, as in the Physical Universe, it takes Time to travel through Space. The cataphract's breach of the shield-wall, which took place as early as A.D. 378 in the Thracian

If this longevity and ubiquity of the cataphract are astonishing, it is also noteworthy that he only becomes ubiquitous in a degenerate form; and, since we have observed already, at an earlier point in this Study, that sheer material range and scale are apt to be symptoms of decay, we shall not be surprised when we read the next chapter in the cataphract's history. The story may be told, again, in the words of a contemporary who in this case was also an eyewitness.

'I was in the army of the Under-Secretary when he went forth to meet the Tatars on the western side of the City of Peace [Baghdad], on the occasion of its supreme disaster in the year A.H. 656 [which began on the 8th January, A.D. 1258]. We met at Nahr Bashir, one of the dependencies of Dujayl; and there would ride forth from amongst us to offer single combat a knight fully accoutred and mounted on an Arab horse, so that it was as though he and his steed together were [solid as] some great mountain. Then there would come forth to meet him from the Mongols a horseman mounted on a horse like a donkey, and having in his hand a spear like a spindle, wearing neither robe nor armour, so that all who saw him were moved to laughter. Yet ere the day was done the victory was theirs, and they inflicted on us a great defeat, which was the Key of Evil, and thereafter there befell us what befell us.'¹

Thus the legendary encounter between Goliath and David at the dawn of Syriac history repeats itself at night-fall, perhaps twenty-three centuries later, as an attested historical fact; and, though on this occasion the giant and the pygmy played their parts on horseback instead of on foot, the outcome was the same.

The invincible Tatar qāzāq who overcame the 'Irāqī cataphract and sacked Baghdad and starved the 'Abbasid Caliph to death in his treasury² and gave the *coup de grâce* to a Caliphate which had been a resumption of the Achaemenian Empire and a reintegration of the Syriac universal state,³ was a light horse-archer of the genuine and persistent Nomadic type which had made itself known, and dreaded, in South-Western Asia for the first time through the Cimmeric and Scyth irruption at the turn of the eighth and seventh centuries B.C. In the heart of the Steppe, from which the Tatars were erupting in their turn in the thirteenth century of the

enclave of the Eurasian Steppe, did not take place till A.D. 1066 in Ultima Thule. In the language of Relativity we might even go so far as to say that Adrianople and Hastings are not two battles but one battle, of which our vision is here diffracted into two different Space-Time positions.

¹ Falak-ad-Din Muhammad b. Aydimir, quoted at first hand by Ibn-at-Tiqtāqā in *Kitāb-al-Fakhri* (Cairo edition, p. 72), apropos of the attitude of the Persians towards the Primitive Muslim Arabs when these had invaded the Sasanian Empire some six hundred years before. The translation here quoted is taken from Browne, E. G.: *A Literary History of Persia*, vol. ii (London 1906, Fisher, Unwin), p. 462.

³ See I. C (i) (b), vol. i, pp. 75-7, above.

Christian Era, the ancient Nomad military technique had lived on to assert its superiority now, at the end of the chapter, over the armour-plated travesty of itself which was what the imitative sedentary societies had made of it in the course of some two thousand years of brief inventiveness and long stagnation. But if David-on-horseback duly discomfited Goliath-on-horseback at this historic moment,¹ the sequel to their encounter in this repetition of the story was also faithful to the original. We have seen² that the mailed champion on foot who was laid low by David's sling-stone was superseded thereafter not by David himself but by a phalanx of Goliaths in which each phalangite was equipped with Goliath's accoutrements but was taught to use them to better effect by fighting in a disciplined formation instead of indulging in the primitive sport of single combat. And now, in the Cavalry Age, discipline won its victory over individualism once more. For Hulāgū Khan's Mongol light horse who had overcome the 'Abbasid Caliph's knights under the walls of Baghdad in A.D. 1258 were subsequently defeated again and again—in A.D. 1260 and 1281 and 1299-1300 and 1303³—whenever they swam the Euphrates and tried conclusions with the Mamlūk masters of Syria and Egypt under whose aegis a new series of 'Abbasid Caliphs had found asylum.⁴ In their accoutrements the Mamlūks were neither better nor worse equipped than their fellow Muslim knights who had been overthrown so ignominiously, a few years before, at Nahr Bashīr; but in their tactics the Mamlūks were true to their name and status⁵ in obeying a discipline; and this discipline gave them the mastery over Mongol sharp-shooter and Frankish knight-errant.⁶

The knights of Saint Louis King of France had met their defeat at Mansūrah at the hands of the Egyptian Mamlūks eight years before the knights of the last 'Abbasid Caliph of Baghdad went

¹ The heavy-armed lancer who had supplanted the light-armed horse-archer in Nomadism's sedentary hinterlands had, however, gained at least one victory over the Nomad in his native war-gear when, in the tenth century of the Christian Era, the German King Henry the Fowler had defeated the Magyar horse-archers by substituting heavy lancers for his own German infantry (Darkó, *op. cit.*, in *Byzantion*, vol. xii (1937), p. 145).

⁴ For the Cairene 'Abbasid Caliphate, which was the juridical basis of the Mamlūk Power in Egypt and Syria from A.D. 1261 to A.D. 1516, see I. C. (i) (b), vol. i, p. 67, footnote 2, and pp. 70-71, above, as well as Part X, below.

⁵ The name 'Mamlūk' means 'held as property', and the status of the Mamlūks was servitude. For the system, exemplified in the Egyptian Mamlūk polity, of making soldiers and administrators out of slaves—a system which was itself of Nomad origin, and which was carried to its highest perfection in the Ottoman Empire—see Part III. A, vol. iii, pp. 28-44, above.

⁶ Etymologically 'knight-errant' is perhaps a contradiction in terms, since the Teutonic word 'knight', like the Arabic word 'mamlūk', means the servant of a master. In modern English usage, however, not only 'knight-errant' but 'knight' itself, *sans phrase*, connotes a warrior who is apt to obey no other master than himself. The Egyptian Mamlūks likewise eventually degenerated, as will appear, into a mob of wayward 'knights', without forfeiting a name which they had ceased to deserve.

448 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
down before the Mongols, and ten years before the Mongols in their turn received their first lesson from the Mamlûks on a Syrian battle-field.

In this invasion of Egypt, which was their first essay in that enterprise, the French did their worst to bring their defeat upon themselves by displaying an incompetence which is in significant contrast to the showing which they made upon their next appearance, five hundred and forty-eight years later, under a much less lovable but much more efficient commander. In A.D. 1250 Saint Louis fell into the initial strategic error of attempting to advance from the coast upon Cairo through the Delta, instead of keeping clear of this maze of waterways and marching along the rim of the desert. In consequence his advance was checked at the junction between the Damietta arm of the Nile and the Ashmûn canal; and when the detachment of knights which he succeeded in pushing across the canal on the night of the 7th-8th February immediately forfeited the fruits of this strategic success, by running wildly into a tactical disaster, the campaign was virtually at an end. Driven back into their previous camp, the defeated French were beleaguered by a victorious enemy, and ravaged by camp-fever, until the night of the 5th-6th April, when a desperate attempt on their part to break out and escape by water, down river, gave the defenders of Egypt an opportunity to complete the destruction of the invaders. On this retreat every Frenchman who was not killed was taken prisoner, and among the prisoners was King Louis himself.

It will be seen that the decisive action of the campaign was the battle of the 8th February, when the French first won, and then threw away, their sole chance of extricating themselves from what was by then already an untenable position. The issue hung upon the fortunes of the engagement between the French knights who had gained the farther bank of the canal and the Mamlûks who were covering the town of Mansûrah. The task which King Louis had assigned to these knights, if and when they succeeded in crossing the canal by the ford, was to occupy and hold the canal bank opposite his own camp, in order to make it possible at last for the main body of the French army to complete the causeway which they had been trying, for days, to throw across the water. The builders had laboured in vain so long as the enemy still held the bank towards which they were building, and was therefore in a position to destroy the work as fast as the French could carry it on. If the knights who had now made good their crossing had been content to execute their orders, the main body of their comrades would have been enabled to join them, and the whole French army

might then have resumed its advance. But at this crucial moment the knights behaved as badly as the Mamlûks behaved well. 'The chief credit of the day belongs to the steady fighting of the Mamlûks, who bore the brunt of the battle and inflicted the chief punishment on their rash opponents.'¹ On the other hand the French knights, once across the canal, forgot their orders, and thereby lost the day for their king, in a childish impatience to engage the enemy and a still more childish competition among themselves for the place of honour in their own battle-array—though their orders were explicit on this point as well.

'On avait ordonné que le Temple ferait l'avant-garde, et que le comte d'Artois aurait la seconde bataille, après le Temple. Or advint que sitôt que le comte d'Artois eût passé le fleuve, lui et toute sa gent piquèrent aux Turcs, qui s'enfuyaient devant eux. Les Templiers lui dirent qu'il leur faisait grande vilenie d'aller devant eux quand il devait aller après, et ils le priaient de les laisser aller devant, comme il avait été accordé par le roi. Or le comte d'Artois ne leur osa répondre, à cause de monseigneur Fourcaud du Merle qui le tenait par le frein de son cheval, et ce Fourcaud du Merle, qui était très bon chevalier, n'entendait rien de ce que les Templiers disaient au comte, par ce qu'il était sourd; et il criait: "Or, sus à eux! Or, sus à eux!" Quand les Templiers le virent, ils pensaient qu'ils seraient honnis, s'ils laissaient le comte d'Artois aller devant eux; ils frapperont des éperons à qui mieux mieux, et chassaient les Turcs qui s'enfuyaient devant eux, à travers la ville de la Massoure, jusques aux champs par devers Babylone.

'Quand ils voulurent revenir en arrière, les Turcs leur lancèrent des poutres et des pièces de bois, par les rues qui étaient étroites. Là fut tué le comte d'Artois, le sire de Coucy qu'on appelait Raoul, et tant des autres chevaliers qu'ils furent estimés à trois cents. Le Temple, comme le Maître me le dit plus tard, y perdit deux cent quatre-vingts hommes armés et tous à cheval.'²

This French disaster of the 8th February, 1250, and the crowning catastrophe of the 6th April which was the inevitable consequence, were manifestly the penalties of an unchastened egotism which could not be atoned for by a quixotic individual valour, while the Mamlûks' victory, both in the decisive battle and in the whole campaign, was just as manifestly the reward of a thorough discipline grafted upon a bravery which was not intrinsically inferior to that of the French. The possessors of both the two fundamental military virtues were bound to prevail over an adversary who was utterly lacking in the more important one.

By the close of the thirteenth century of the Christian Era, when

¹ Lane-Poole, S.: *A History of Egypt in the Middle Ages*, 2nd edition (London 1914, Methuen), pp. 236-7.

² Joinville, Jean Sire de: *La Vie du Saint Roi Louis* mise en nouveau langage par Henri Longnon (Paris 1928, A l'enseigne de la Cité des Livres), pp. 87-8.

the Mamlūks had established their superiority over the French on the one hand and over the Mongols on the other, they stood in a position of unchallenged military supremacy, within the bounds of their own horizon, that is comparable to the position of the Romans after the Battle of Pydna. In this eminent but enervating situation the Mamlūk, like the legionary, 'rested on his oars'; and it is a curious coincidence that he was allowed to rest on them for almost exactly the same length of time before he was taken unawares by an old adversary armed with a new technique. The Roman triumph at Pydna in 168 B.C. and disaster at Adrianople in A.D. 378 are divided by an interval of five hundred and forty-six years, while the number of years between the Mamlūk triumph at Mansūrah in A.D. 1250 and disaster at Imbābah in A.D. 1798 is five hundred and forty-eight. In the Battle of the Pyramids the enemy who exploded the Mamlūks' traditional reputation for invincibility were descendants of the Frenchmen at whose expense that reputation had been originally acquired; for, while in the life of the Mamlūks Time had been standing still, the passage of five and a half centuries had sufficed for the French to discard the blundering technique of Saint Louis's disorderly knights and to train themselves, instead, in the discipline of a uniformed infantry, equipped with fire-arms, on a new model which had been displayed to Western Christendom since the fourteenth century by the 'Osmanlis.'¹ This metamorphosis of the French may serve as a reminder that the Gothic victory, and Roman débâcle, at Adrianople in A.D. 378 was likewise due to a metamorphosis which had been previously accomplished by the victors. The Gothic cataphracts who put the legions of Valens out of action were descended from North European barbarians of the same stamp as the Sueves and Gauls who had been an easy prey for the legions of Julius Caesar. It was the Goths' intensive schooling in horsemanship on the Steppes, in an age when the legionaries were standing at ease, that enabled Alatheus and Saphrax to avenge the defeats of Ariovistus and Vercingetorix.

We may further observe, without overstraining our parallel, that the warning which the Romans received, at Carrhae in 53 B.C., of the cataphract's coming ascendancy has its analogue in the three successive blows which the Mamlūks received in A.D. 1516-17, when they were routed—first at Marj Dābiq and then at Gaza and then again at Raydāniyah—by the Janissaries.

After the second disaster of the three, the Mamlūk survivors who made their way back to Cairo retailed to a panic-stricken populace

¹ For the Ottoman origin of our modern Western infantry technique see Part III. A, vol. iii, p. 38, footnote 2, above.

their terrifying experience of a new and irresistible Ottoman military technique.

'They arrived in the most pitiable state; the plunder and slaughter had been worse than before. Some of the Imperial Mamlūks came back on donkeys, some on camels—all having been deprived of uniforms, horses and arms. None survived, in fact, but a few for whom Fate had so decreed. They said that some of Ibn 'Othmān's troops were armed with hooks on their lances, with which they dragged the rider from his horse and threw him on the ground. Jān Birdī said that he was thus thrown down. . . . They also said that Ibn 'Othmān's troops were in numbers as swarms of locusts; that some of them were armed with muskets (firing a leaden bullet) and were carried in wooden carts, drawn by oxen and buffaloes, moving at the head of the advanced guard; and many other things of this nature.'

The confusion and division of counsels which prevailed in the Mamlūk capital while Selīm the 'Osmanli was advancing, unchecked, from the Taurus to the Nile, is a counterpart of the picture which Joinville paints of Saint Louis's camp in the Delta; and in this case, as in that, there is a grim inevitability about the last act—which was played in January 1517 when the Ottoman army arrived at the feeble fortifications that had been thrown up at the last moment, across the last stage of their road to Cairo, by the last Sultan of the Mamlūks.²

'The drums beat to battle, the chief amīrs and the whole force mounted and extended across the plain. Ibn 'Othmān's soldiers came on like locusts in multitude, and they were superior in point of numbers. The two armies met in the outskirts of Raydāniyah, and a terrible battle ensued. . . . Countless numbers of the Turks were killed, including Sinān Pasha, Ibn 'Othmān's former tutor and his chief wazīr, and a great many of his amīrs. Their bodies lay scattered from 'Allān's fountain (?) to the tomb of Amīr Yashbak, the Dawādār. Then the Turks recovered, coming up from every direction like clouds. They divided into two forces, one advancing under Jabal Ahmar and the other by the camp at Raydāniyah. The noise of their musketry was deafening, and their attack furious. In a short time countless numbers of Egyptian troops had fallen, including a great many of the chief amīrs, among whom was Azbak, the gunner. . . . In the short space of about sixty minutes the Egyptian army was defeated and in full retreat.

'Tūmān Bey stood his ground about eighty minutes after this, and fought on with a few of his armed slaves and Mamlūks, inflicting great losses on Ibn 'Othmān's men. Finally, when the Turks were too many for him, finding himself deserted by his troops, and fearing capture, he folded up the Royal Standard and ran and concealed himself.

¹ Ibn Iyās, Muḥammad b. Ahmad: *An Account of the Ottoman Conquest of Egypt in the Year A.H. 922 (A.D. 1516)*, translated by Salmon, W. H. = *Oriental Translation Fund, New Series*, vol. xxv (London 1921, Royal Asiatic Society), pp. 97-8.

² For these ineffectual activities of Sultan Ashraf abū'l-Nasr Tūmān Bey see Ibn Iyās, *op. cit.*, pp. 107-8.

'This was the third defeat [that] the Egyptian army had suffered.

'The Turkish force that had advanced under cover of Jabal Ahmar came down upon the tents of the Sultan, plundering everything—kit, arms, horses, camels and oxen, including the guns [that] the Sultan had put into position there, with the shields and palisading, and the vehicles on which the Sultan had spent so much time, labour and money, and from which he had reaped no advantage. Everything in the camp was plundered. Such was the decree of Fate.'¹

Fate, however, dealt less harshly with the Mamlūks in the hour of their defeat than she dealt with the country which it had been the Mamlūks' *raison d'être* to defend against all comers. For the Mamlūks were not condemned to the extinction which was the logical penalty for their failure to perform their one and only function,² while Egypt, who had played a purely passive part in the Mamlūk-Ottoman conflict, and had taken it for granted that she would be the prize of the victors, was now compelled to provide an additional consolation prize for the vanquished, and found herself saddled with the double burden of having to maintain a new garrison of victorious 'Osmanlis³ without being relieved of her old garrison of no longer victorious Mamlūks.⁴ Sultan Selim's motive in showing this generosity to his vanquished opponents at his new dominion's expense was perhaps a mixture of soldierly contempt for the Mamlūks' military ineptitude with professional sympathy for a corps which, however decadent, was still akin—in origin and constitution and ethos—to the Sultan's own Slave-Household.⁵ He may have calculated that the Mamlūks, humiliated on the battle-field and reduced in the political hierarchy to a subordinate rank, would be incapable of endangering a once established Ottoman supremacy, while they might at the same time serve as an effective reinforcement to the Ottoman governor and garrison in holding down the Egyptian 'ulamā and fallāhīn, and also perhaps as an effective restraint upon these 'Osmanlis if the wealth and seclusion of the province committed to their charge should ever tempt them to betray their trust and to repudiate their allegiance to the Porte in order to enjoy the good things of Egypt for themselves.⁶ Whatever the expecta-

¹ Ibn Iyās, op. cit., pp. 112-113.

² On this point see also IV. C (ii) (b) 2, p. 113, above.

³ Six (Bosniak) Janissary ojaqs.

⁴ This piling of an Ottoman on the top of the Mamlūk incubus which was already weighing upon the back of the long-suffering Egyptian beast of burden is a feature of the decadence of the Arabic Civilization which may be compared with the cumulative imposition of the litterati and the priests and the military upon the Egyptian peasantry in the decadence of the Egyptian Civilization, some three or four thousand years back (see IV (iii) (c) 2 (β), pp. 418-23, above).

⁵ For the species of Nomad institution in *partibus agricolarum* of which the Egyptian corps of Mamlūks and the Ottoman Pādīshāh's Slave-Household were alike representatives, see Part III. A, vol. iii, pp. 28-44, above.

⁶ This last consideration was the determining factor in Sultan Selim's policy according to C. F. Volney: *Voyage en Syrie et en Egypte pendant les années 1783, 1784*,

tions and intentions of the Ottoman conqueror of Egypt may have been, his settlement did secure to the Ottoman Imperial Government an effective mastery over Egypt which lasted almost as long as the antecedent reign of the Mamlûks themselves.¹ In the end, however, the Ottoman garrison of Egypt allowed the military decision of A.D. 1516-17 to be reversed through a gradual and pacific revolution which came to pass because the Ottoman garrison abandoned, while the Mamlûk corps continued to observe, the fundamental common rule of the species of Nomad institution to which both these corporations belonged.

This rule was the rigid exclusion, *ex officio*, of the soldier's children from the soldier's service, and the recruitment of the military corporation, in defiance of human nature, by the purchase of slaves and not by the begetting of sons.² In permitting the Egyptian Mamlûks to survive, Sultan Selîm had implicitly sanctioned the perpetuation of the existing ways and means by which they reproduced their kind in accordance with the general rule of Nomads in *partibus agricolarum*. Under the Ottoman domination the Mamlûks were still free to import slave-boys from their customary sources of supply³ in order to keep their complement up to strength, and they persevered in the practice when the Ottoman garrison in Egypt abandoned it. The Janissaries who were quartered in Egypt suffered still more severely in *moral* than their comrades in other parts of the Empire from the admission of the principle of heredity, which the corps extorted from the Imperial Government after the death of Sultan Suleyman in A.D. 1565.⁴ For this abandonment of the fundamental rule of the service meant that the Janissaries, instead of remaining a people apart, became merged in the local Muslim population from which they took the wives

et 1785, 2nd edition (Paris 1787, Desenne et Volland), vol. 1, pp. 96-7. We may compare the precautions taken by Augustus, after his own conquest of Egypt, to make sure that no Roman governor of the new Imperial province should have it in his power to repeat the performance of Mark Antony.

¹ The Mamlûks had ruled Egypt for 267 years, from their succession to the heritage of the last Ayyûbid Sultan in A.D. 1250 to the overthrow of the last of their own Sultans in A.D. 1517. The Ottoman Imperial Government remained in effective control of Egypt for 229 years from Selîm's entry into Cairo in A.D. 1517 to the *pronunciamiento* of Ibrâhîm Kethûda in A.D. 1746.

² On this vital point see Part III. A, vol. iii, pp. 28-35, above.

³ The Egyptian Mamlûks had originally made their purchases of boys, through Venetian middle-men, from the Mongol Khans of Qipchâq, who obtained their stocks by making systematic slave-raids upon all the sedentary populations round about their ranges—including the Russians and Poles in one direction and the Circassians in another (see Part III. A, vol. iii, p. 30, footnote 3, above). After the Ottoman conquest of Stamboul and Pera in A.D. 1453 and Caffa and Tana in 1475, the supply of slaves from Qipchâq (now reduced to the narrow limits of the Khanate of the Crimea) was diverted from the Egyptian to the Ottoman market (for this source of supply for the Ottoman Pâdishâh's Slave-Household see Part III. A, vol. iii, p. 35, footnote 3, above). Thereafter the Egyptian Mamlûks drew their recruits from the Orthodox Christian populations of Georgian nationality in Transcaucasia (see Part III. A, vol. iii, p. 32, footnote 2, above).

⁴ See Part III. A, vol. iii, pp. 44-5, above.

454 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
that bore the sons who now, in due course, stepped into their superannuated fathers' places in the ranks; and while the Janissaries of the metropolitan provinces intermarried with the Turkish-speaking Muslims of Rumelia and Anatolia, who were, and felt themselves to be, a ruling race,¹ the Janissaries of Egypt intermarried with an Arabic-speaking townsfolk and peasantry² who had been for centuries the *ra'iyyah* of the Mamlüks.³

In these circumstances it is not surprising that the Mamlüks should have been rewarded for their refusal to 'go native' by obtaining over the degenerate Ottoman garrison an ascendancy which carried with it a *de facto* restoration of the Mamlük rule over Egypt itself, since the Ottoman garrison, before becoming the Mamlüks' creatures, had already reduced to a cipher the authority of the Pasha who was the local representative of the Porte. Though the outward forms of Ottoman sovereignty were all still sedulously preserved at the time of the French observer Volney's visit to Egypt in A.D. 1783-5, the Pasha of the day, in his residence on the citadel of Cairo, was virtually a hostage in the Mamlüks' hands; and the pronouncement of the one Arabic word *Anzal* ('Descend!') from the mouth of the Mamlüks' herald was sufficient to bring this Ottoman bird of passage down from his precarious perch and send him back home to Constantinople at any moment, even before the expiry of his proper three-years' term.⁴ The Porte winked at this practically complete usurpation of its authority in Egypt by a military corps which it had once permitted to exist on sufferance. It not only made no attempt to repeat the exploit of Sultan Selim I and to reassert its authority by force of arms; it did not even think of condemning the Mamlüks to a choice between extinction and degeneracy by resorting to the economic weapon and cutting off the rebels' supply of slave-recruits at its Transcaucasian source!

Thus, by a curious turn of Fortune's wheel, the Mamlüks virtually recovered in the course of the eighteenth century of the Christian Era a dominion over Egypt which they had lost in A.D. 1517; but a comparison of Volney's picture of them with that of Ibn Iyās shows that they had 'forgotten nothing and learnt nothing'⁵ during two and a half centuries of adversity and eclipse. As Volney

¹ See Part III. A, vol. iii, p. 35, above.

² See Gibb, H. A. R., and Bowen, H.: *Islamic Society and the West*, vol. i (London 1939, Milford), chap. 4, § 2.

³ The part played by these native marriages of the Egyptian Janissaries in bringing about the historic reversal of the psychological, the social, and eventually the military and political relations between the Egyptian Janissaries and the Egyptian Mamlüks is noticed by Volney in *op. cit.*, vol. i, p. 99. The Mamlüks did not mate with Egyptian women, but with Transcaucasian fellow countrywomen, and fellow slaves, of their own (Volney, *op. cit.*, vol. i, p. 99, footnote 1).

⁴ Volney, *op. cit.*, vol. i, pp. 348-51.

⁵ See IV. C (iii) (c) 2 (α), p. 264, above.

saw them, when their accidental reprieve was almost at an end and their final disaster was imminent, the excellence of their weapons (they now affected English carbines) was entirely offset by the ungainliness of their costume, the clumsiness of their saddlery, the roughness of their horsemanship (which ruined a horse's mouth and legs), the childishness of their tactics, and, worst of all, by a lack of discipline which was the very antithesis of their original *esprit de corps*.¹

'La pièce la plus singulière de cet habillement est une espèce de pantalon, dont l'ampleur est telle que dans sa hauteur il arrive au menton, et que chacune de ses jambes pourrait recevoir le corps entier: ajoutez que les Mamlouks le font de ce drap de Venise qu'on appelle *saille*, qui, quoiqu'aussi moelleux que l'elbeuf, est plus épais que la bure; et que, pour marcher plus à l'aise, ils y renferment, sous une ceinture à coulisse, toute la partie pendante des vêtements dont nous avons parlé. Ainsi emmaillotés, on conçoit que les Mamlouks ne sont pas des piétons agiles; mais ce que l'on ne conçoit qu'après avoir vu les hommes de divers pays, est qu'ils regardent leur habillement comme très-commode. En vain leur objecte-t-on qu'à pied il empêche de marcher, qu'à cheval il charge inutilement, et que tout cavalier démonté est un homme perdu; ils répondent: *C'est l'usage*, et ce mot répond à tout.'²

As for the childishness of the Mamlūks' tactics, it was exemplified in A.D. 1776, when they were confronted with the unfamiliar task of besieging the Syrian city of Jaffa in the course of a petty local war—let loose by the breakdown of the *Pax Ottomanica*—between a Mamlūk tyrant of Egypt and an Arab tyrant of Palestine.³ On this occasion the Mamlūks began by pitching their camp within range of the defenders' artillery; and then, when a breach had been blown for them in the flimsy curtain-wall of the besieged city by an English soldier of fortune named Robinson, and the moment came for taking the place by assault,

'les Mamlouks voulaient qu'on le fit à cheval; mais on leur fit comprendre que cela était impossible; et, pour la première fois, ils consentirent à marcher à pied. Ce dut être un spectacle curieux de les voir avec leurs immenses culottes de *sailles* de Venise, embarrassés de leurs beniches retroussés, le sabre courbe à la main et le pistolet au côté, avancer en trébuchant parmi les décombres d'une muraille. Ils crurent avoir tout surmonté, quand ils eurent franchi cet obstacle; mais les assiégés, qui jugeaient mieux, attendirent qu'ils eussent débouché sur le terrain vide qui est entre la ville et le mur: là, ils les assaillirent, du haut

¹ See Volney, *op. cit.*, vol. i, chap. 11, 'Constitution de la Milice des Mamlouks', pp. 151-69.

² Volney, *op. cit.*, vol. i, pp. 155-6. The Parthian and Sasanian cataphracts wore drawers of the same unpractical kind, which immobilized them, with the same fatal results, as soon as they were out of the saddle.

³ See Volney, *op. cit.*, vol. i, pp. 131-9.

des terrasses et des fenêtres des maisons, d'une telle grêle de balles que les Mamlouks n'eurent pas même l'envie de mettre le feu; ils se retirèrent, persuadés que cet endroit était un coupe-gorge impénétrable, puisqu'on n'y pouvait entrer à cheval.¹

This fantastic performance of the Mamlûks at Jaffa, in A.D. 1776, is a worthy pendant to the performance of their old French adversaries at Mansûrah in A.D. 1250. By this date the Mamlûks were incapable of taking a city, even when they had a Frankish artilleryman at their command to open the way. What a contrast to their performance in A.D. 1291, when they had besieged and taken Acre in the teeth of all the Franks in the World, who were then up in arms to defend the last Frankish foothold in the Christian Holy Land! Yet the Mamlûks' latter-day ineptitude in tactics was, if possible, less serious than the dissolution of their ancient discipline.

'Dans notre Europe, quand on parle de troupes de guerre, on se figure sur le champ une distribution d'hommes par compagnies, par bataillons, par escadrons; des uniformes de tailles et de couleurs, des formations par rangs et lignes, des combinaisons de manœuvres particulières ou d'évolutions générales; en un mot, tout un système d'opérations fondées sur des principes réfléchis. Ces idées sont justes par rapport à nous, mais, quand on les transporte aux pays dont nous traitons, elles deviennent autant d'erreurs. Les Mamlouks ne connaissent rien de notre art militaire; ils n'ont ni uniformes, ni ordonnance, ni formation, ni discipline, ni même de subordination. Leur réunion est un attroupement, leur marche est une cohue, leur combat est un duel, leur guerre est un brigandage. . . .'²

The strictures here passed upon the Mamlûks are applied by the same observer, in another place,³ to all the military establishments of the day in Turkey-in-Asia.

'Les Turks, et surtout ceux de l'Asie, diffèrent encore plus des Européens par l'état militaire que par les usages et les mœurs. . . . Il ne faut pas s'imaginer ici des mouvemens combinés, tels que ceux qui, depuis cent ans, ont fait de la guerre parmi nous une science de calcul et de réflexion. Les Asiatiques n'ont pas les premiers élémens de cette conduite.'

In this last passage Volney's acute observation and luminous thought are distinguished by a touch of that historical sense which was the poorest piece in the intellectual armoury of most eighteenth-century French philosophers.⁴ Yet, although Volney is dimly aware

² Volney, *op. cit.*, vol. i, p. 163.

³ Volney, *op. cit.*, vol. i, pp. 113-16, apropos of the army with which 'Alî Bey, the tyrant of Egypt, invaded Syria in A.D. 1771, and the forces with which his aggression was disputed by the Pashas of Saida, Tripoli, and Aleppo. In this other passage the theme—and even the slightly rhetorical peroration—of the passage quoted just above occurs with a more general application.

⁴ The brilliant exception is Turgot.

that the disciplined and scientific Western warfare of his day is something of recent date, he is apparently blind to the extraordinary and illuminating historical *περιπέτεια* upon which he has stumbled. In this vista his vision is already obscured by the two modern Western dogmas of 'the Incomparable West' and 'the Unchanging East', which mask his penetrating eyes like a pair of blinkers.¹ This *fin-de-siècle* Frenchman does not realize that the art of war which the West has acquired within the last century is not an original creation of the Western genius but is merely the result of an industrious and intelligent mimesis of an Ottoman *fait accompli*; and he is still farther from realizing that his satirical contrast between Western discipline and Mamlūk anarchy in the ninth decade of the eighteenth century is the precise inverse of the contrast that he would have had to draw if he had happened to be an Arabic observer making his comparison between the Mamlūks and the French at a date five hundred years back.

We may conjecture that Volney, when he wrote the brilliant book from which we have been quoting, had read neither Busbecq's *Exclamatio*² nor Joinville's chronicle of the Egyptian campaign of Saint Louis; but it is also tempting to conjecture that Volney's own mordant description of the general military ineptitude of the Mamlūks and 'Osmanlis, as he had observed it for himself at first hand, may have come to the notice of the author's younger contemporary Bonaparte at some date between the first publication of Volney's *Travels* in A.D. 1787 and the decision—which was taken at Bonaparte's instance by the Directory in A.D. 1798—to send a French military expedition to Egypt.³

The dazzling prospects which this project opened up, and which Bonaparte found irresistibly attractive, arose from the fact that, in the course of the two preceding centuries, the Governments of the Western World had acted upon the advice which had been pressed upon them so urgently and so eloquently by Busbecq—the first modern Western observer of first-rate ability who saw the Ottoman polity in its prime—in a pamphlet⁴ which he published after his return in 1562 from his diplomatic mission to Constantinople as ambassador from the Court of Vienna. Busbecq's thesis

¹ For the catchword of 'the Unchanging East', and its effect of fortifying, in Western minds, 'the Egocentric Illusion', see I. C (iii) (b), vol. i, pp. 164–8, above.

was¹ that the only remaining chance of saving the sovereign Powers of the West from the imminent doom of an Ottoman conquest lay in scrapping the mobs of ragged, ill-armed, and semi-criminal vagrants that passed for armies in sixteenth-century Western Christendom, and replacing them by uniformed, disciplined forces, armed with muskets, on the model of those Janissaries by whose military prowess the sovereignty, and indeed the very existence, of all the Western states was being threatened in Busbecq's time. This course was duly followed by the princes of his own world to whom the Flemish publicist had addressed himself. Between Busbecq's day and Bonaparte's, while the Janissaries were becoming 'a nation of shopkeepers' at Constantinople and were 'going native' at Cairo, a passable imitation of the Janissary corps, as Busbecq had seen and described it, was being recruited—by the approved Ottoman methods of conscripting peasants and drilling jail-birds and kidnapping 'likely fellows'—in all the leading states of Western Europe; and by A.D. 1798 the French Janissaries were ready to repeat the exploit which had been successfully carried out by their Ottoman exemplars in A.D. 1516–17. The Mamlûks, on their part, in the year when Napoleon landed, were just what they had been in 1516, and just what Saint Louis's knights had been in 1250 (when the Mamlûks themselves had borne much more resemblance to the soldiers of Napoleon or the soldiers of the first Selim); and a student of history who compares the records of the three campaigns in the narratives of three eyewitnesses—Joinville for 1250 and Ibn Iyās for 1516–17 and Jabartî for 1798—cannot fail to be struck by the remarkable uniformity of atmosphere, as well as of incident, that he will find in these three pictures. Here is the picture as it is painted by Jabartî.

'On Sunday the 10th of this holy month [of Muharram] messengers from Alexandria brought [to Cairo] letters containing the news that on Friday the 8th of the same month ten English ships had made their appearance in the offing and had approached close enough inshore to be visible from the beach.

'A little later, fifteen more ships came to join them.

'The townspeople were wondering what the foreigners could have come for, when a little boat stood in and landed ten persons, who proceeded to wait upon the notables of the city and upon the governor-plenipotentiary, the Sayyid Muhammad Kuraym, of whom we shall have more to say later.

'These foreigners said that they were Englishmen, and they added that they were on the look-out for some Frenchmen, who had started, with a considerable fleet, for an unknown destination. They were afraid, they said, of seeing these Frenchmen make a surprise attack on Egypt,

¹ See Part III. A, vol. iii, p. 38, footnote 2, above.

because they knew that the people of Egypt would not be able to repel the invaders or to prevent them from landing.

"The Sayyid Muhammad Kuraym supposed that the English *parlementaires* were laying a trap for him; he did not give the slightest credence to what they said, and his answer to them was forbidding. The foreigners then went on to say: "We shall be content to keep the sea with our ships, in order to defend the city and patrol the coast; we shall ask you for nothing but water and provisions, and for these we will undertake to pay." The notables of the city, however, refused, like the Governor himself, to enter into relations with the English, and said to them: "This country belongs to the Sultan, and neither the French nor any other foreigners have any business here; so be good enough to leave us." At these words the English messengers returned to their ships and went off to look for their provisions somewhere else, instead of at Alexandria, "in order that God might accomplish the work that was foreordained in his decree." . . .

"On Wednesday the 20th of the same month letters [received in Cairo] from Alexandria, Rosetta and Damanhūr brought the news that on Monday the 18th a French fleet, in great force, had arrived off Alexandria. . . . By the next morning the French had spread, like locusts, all round the city. Thereupon the people of Alexandria had joined forces with the Badu who had come from Bahīrah with the *kāshif* of that province, and had attacked the French; but they had found themselves unable either to repel or to resist them. . . . They were quite unprepared for the struggle; and, moreover, the arsenals contained neither arms nor munitions; so they realized that they were courting certain defeat, and accordingly sued for peace. . . .

"On the Monday it was learnt that the French had reached Damanhūr and Rosetta. . . .

"[On Sunday, the 1st Safar] Ibrāhīm Bey [one of the leading Mam-lūks of the moment] went . . . to Bulāq and convened the Pasha, the 'ulamā and all the shaykhs for consultation. They . . . decided that fortifications should be thrown up along a line from Bulāq to Shubrah, and that Ibrāhīm Bey should stay at Bulāq with his troops. . . . On Monday [the 2nd Safar] Murād Bey came to Imbābah to arrange for the construction of fortifications from there to Bashtil; he personally undertook the direction of the work. . . . On the Tuesday the trumpets were sounded to summon the inhabitants to come out of the city and man the fortifications at Bulāq; so everybody went to Bulāq, and nobody was left in Cairo except the women and children and the old men who were past active work. . . .

"On Friday the 6th of the same month the French reached Kūm-al-Aswad, and on the Saturday morning they reached Umm Dīnār. . . . At midday, at the height of the heat, a party of troops, encamped on the west bank of the Nile, mounted and advanced towards Bashtil, near Imbābah, and when these Egyptian troops saw the French army they hurled themselves upon it with fury. The French received them with a continuous fusillade, and in this engagement both sides fought with

460 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
ferocity. The defterdār Ayyūb Bey, the kāshif 'Abdallah Bey, other kāshifs of Muhammad Bey al-Alfī, and large numbers of Mamlūks, were killed in this battle. The survivors were pursued by about six thousand French troops under the command of General Desaix, who was afterwards governor of Upper Egypt. . . .

'Desaix pursued the Mamlūks right up to Murād Bey's fortifications. . . . The French troops who were advancing to engage Murād Bey had manœuvred, as the French do, in such a way that at a certain moment the Egyptian soldiers found themselves caught between two fires, on their front and in their rear; the drums beat, and the musketry fire doubled in intensity, and the artillery fire did the same. The wind whistled, the dust whirled, the air was darkened by the powder-smoke, the combatants' ears were deafened by the ceaseless reports of the explosions—you would have thought that it was an earthquake, or that the sky was falling.

'The engagement lasted three quarters of an hour, and the Egyptian army on the west bank was routed. Many troopers were drowned that day in the Nile, so hard were they pressed by the enemy; many others were taken prisoner. At the close the French were left masters of the battlefield and of all the fortifications. As for Murād Bey, he fled to Gizah with all his suite, looked in at his palace, and then left for Upper Egypt within a quarter of an hour.'

This first-hand account, from the pen of al-Jabartī, of the French descent upon Egypt in A.D. 1798 resembles the first-hand account of the Ottoman descent in A.D. 1516-17—which we have already quoted from the chronicle of Ibn Iyās—in conveying from the direct experience of an unsophisticated spectator of an actual event an impression which is imaginatively created by a stroke of literary art in the opening passages of Mr. H. G. Wells' fantasy *The War of the Worlds*. In this twentieth-century Western work of fiction the 'Martian' invaders suddenly appear 'out of the blue' upon the surface of a planet whose inhabitants have had no suspicion of their approaching advent and have made no preparations for contending with a war-machine which is not only quite unfamiliar and new-fangled but is also so much more potent than their own that it seems completely invincible at the first encounter. In the experience of a sixteenth-century and an eighteenth-century Egyptian observer the unheralded and unexpected impact of the Ottoman and the French infantry—with their 'Martian' uniforms and drill and fire-arms—made the same impression 'in real life', when it swept away the Mamlūks who rode out to meet their fate with that blind confidence in their own ineptitude which had been the death of Saint Louis's knights at Mansūrah in A.D. 1250.

¹ Jabartī, Shaykh 'Abd-ar-Rahmān al-: *'Ajā'ib-al-Āthār, fi'l-Tarājim wa'l-Akhbār* (Cairo, A.H. 1322, 4 vols.), vol. iii, *ad init.* French translation—*Merveilles Biographiques et Historiques* (Cairo 1888-96, Imprimerie Nationale; Paris 1888-96, Leroux: 9 vols.), vol. vi, *ad init.*

The history of the Egyptian Mamlūks illustrates the truth of the saying that

'One day is with the Lord as a thousand years, and a thousand years as one day. The Lord . . . is long-suffering to usward, not willing that any should perish. . . . But the day of the Lord will come as a thief in the night; in which the heavens shall pass away with a great noise, and the elements shall melt with fervent heat, the earth also and the works that are therein shall be burnt up. . . .¹ For when they shall say: "Peace and safety", then sudden destruction cometh upon them, as travail upon a woman with child; and they shall not escape.'²

On the occasion of their first discomfiture, when they were taken unawares by the Janissaries in A.D. 1516-17 after having vegetated in a military technique which had been obsolete by that time for some two hundred years, the Mamlūks were let off lightly. They were not only reprieved from the doom of annihilation to which they had exposed themselves, but they were also eventually reinstated, by a turn of Fortune, in the dominion over Egypt. But when they then vegetated on and allowed the same fate to overtake them for the second time, they exhausted their draft upon the long-sufferingness of their Creator; and the leniency which the Ottoman Sultan Selim I had been moved to exercise in A.D. 1517 was not displayed by the Ottoman soldier of fortune Mehmed 'Alī, who stepped boldly and ably into the political vacuum which was left in Egypt when the French conquerors of the Mamlūks and the English adversaries of the French had cancelled one another out. The fiasco of A.D. 1798, which demonstrated conclusively that the Mamlūk corps had degenerated into an *ἄχθος ἀρούρης*, received condign punishment in the massacre of 1811.³

We have now traced our 'chain of destruction' from Goliath the first of the hoplites to Murād Bey the last of the cataphracts;⁴ and we need not linger long over the latest links, which are exceedingly familiar to Western students of history in our generation. We need only remind ourselves that, since the moment at the turn of the seventeenth and eighteenth centuries of the Christian Era when the 'Osmanlis allowed the new infantry technique which they had

¹ 2 Peter iii. 9-10.

² 1 Thess. v. 3; cf. Matt. xxiv. 36-51 = Mark xiii. 32-7, and Luke xii. 35-48, xvii. 26-37, and xxi. 34-6.

³ For the destruction of the Mamlūks by Mehmed 'Alī see Part III. A, vol. iii, p. 31, and p. 50, footnote 1, above.

⁴ Not quite the last; for the 'Die-Hard' band of survivors from the catastrophe of 1811 who held out against Mehmed 'Alī thereafter in the African hinterland of Egypt on the upper reaches of the Nile (see vol. iii, p. 31, above), bequeathed their armament and technique to those mailed horsemen, in the service of the khalifah of a Sudanese Mahdī, who went down under the fire of British infantry in 1898 at Omdurman (see V. C (ii) (a), vol. vi, pp. 227 and 235, below). In the year 1938 there were cataphracts still to be seen in all their glory in Northern Nigeria and in Rājputāna; but in both these countries their role had by then become merely decorative.

462 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
invented to be wrested out of their hands by their long-despised opponents in the West, this technique has neither remained static nor been held as a permanent monopoly by any single Western nation.

The French army which overthrew the Mamlûks at the Battle of the Pyramids in 1798 was already something different from the earliest version of the Western imitation of the Janissaries. It was a recent product of a French *levée en masse* which, since 1793, had succeeded in superseding, by successfully diluting, the small but superlatively well-drilled professional Western army of the eighteenth century, after this had been brought to the highest perfection of which it was capable by the pedantry of a Frederick William I and the genius of a Frederick the Great.¹ The ascendancy which had been established at Valmy—before the interlude of the Egyptian expedition—by an organized French nation-in-arms over the soldiers of the *ancien régime* was to be confirmed thereafter at Austerlitz² and Jena; and the overthrow of the old Prussian army at Jena was to stimulate a Prussian pleiad of military and political men of genius to outdo the French in the new *tour de force* of combining discipline with numbers—and this with such effect that the humiliations of the War of 1806-7 would be wiped out in the *Befreiungskrieg* of 1813-14.

The French so far failed to take to heart the lesson of those latter years, that they brought defeat upon themselves a second time, with still more calamitous results for France, in 1870-1; but the French were happier than the Mamlûks, inasmuch as their second débâcle did not prove to be the end of their military glories. So far from that, they suffered less, in the long run, from losing the war of 1870-1 than the Germans suffered from winning it; for the Prussian General Staff was so dazzled by the brilliance of its own success in 1870 that, forty-four years later, it was still unable to think of a European war in terms of any other strategy, with the consequence that in the General War of 1914-18 the Prussian war-machine brought defeat upon Germany and her allies by evoking an unforeseen *riposte* in the shape of a siege on an unprecedented scale. In 1918 the old methods of 1870 were proved, by the sensational collapse of the previously predominant con-

¹ This ominous increase in the 'drive' of Western warfare has been touched upon in IV. C (iii) (b) 3, pp. 150-5, above.

² Napoleon's victory at Austerlitz is one of the few European events that Jabarti mentions in a chronicle which runs through the whole period of the French Revolution and the Napoleonic Wars. Even in his account of the year A.H. 1213 (A.D. 1798-9), in which the disturbances in Europe impinged, with a vengeance, upon the even tenour of Egyptian life, the traditionally minded Arabic chronicler designates, as the most important event of the year, the intermission of the annual pilgrimage to the Holy Cities of the Hijâz owing to the alarms and excursions of the Wahhâbis (Jabarti, *Merveilles Biographiques et Historiques*, vol. vi, p. 121).

tinental European military Power, to be no match for the new methods of trench warfare and economic blockade. And in the year 1938 it was again already certain that the technique which had won the war of 1914-18 would not be the last link in the chain—if Mankind were so perverse as to go on cultivating the Art of War after it had attained a degree of deadliness at which any further indulgence in belligerency seemed likely to bring with it the total destruction of Society.

In another war in the West the 'post-war' British Navy and the 'post-war' French system of semi-subterranean frontier fortifications might well prove to be nothing but mill-stones round the necks of the winners of what would then be remembered by Posterity, not as 'the war to end War', but merely as the event of 1914-18 in a military competition which the lacerated competitors had failed to bring to a timely end. In another war the French fortifications might be overleapt, and the British Grand Fleet sunk in harbour, by enemy aircraft laden with all the destructive contrivances of the twentieth-century Western chemists. 'The next war', if it ever came to wipe 'the Great Society' out of existence, might well be won—if the notion of 'victory' then still retained any meaning—by a 'post-war' professional force whose strength would lie, not in numbers, but in a discipline and training which would enable these twentieth-century Janissaries to profit to the full from an unrivalled command over an armoury of new-fangled weapons. A gang of such militarized mechanics might conquer by the same arts and virtues as the grenadiers of Frederick the Great and the musketeers of Selim I; and if the victorious war-band of Strakers-at-arms were the German *Reichswehr*, then the wheel of European military history would have come round full circle. During the thirteen 'post-war' years that elapsed between the coming into force of the Peace Treaty of Versailles in January 1920 and the advent of Herr Hitler to power in the Reich in January 1933, it seemed possible that this destiny might have been forced upon Germany by the enemy statesmen who had imposed a long-service professional army upon her at the Peace Conference of Paris. But this ironical prospect had been superseded by one that was more ironical still by the time when the Austrian Führer of Prussia-Germany had been five years in the saddle. Herr Hitler's mission was to liquidate the *Versailler Diktat*; and he was unwilling to accept from the *ci-devant* victors even a blessing in disguise which they had perhaps conferred on Germany without ever intending to do her good. Herr Hitler's single-track aim was to get rid of every jot that had been imposed on Germany, without taking the tittles on their merits. And accordingly the brilliance of the

audacity with which he duly recovered Germany's military freedom of action was matched by the strictness of the conventionality of the use which he made of this success. He set himself to demonstrate Germany's liberation from the shackles of Versailles by giving her precisely the kind of army that the treaty forbade her to possess; and this imperious psychological necessity entailed a serious technological retrogression. Under the Nazi regime the formidable professional force which had been thrust upon the Weimar Republic by hostile foreign hands was deliberately replaced by a conscript citizen army of that long since antiquated type that had been out of the French 'Ideas of Seventeen Eighty-Nine'!

Having now watched Goliath and David fight first on foot and then on horseback, we cannot leave the amphitheatre without waiting to see the arena transformed into a *naumachia* for our pair of gladiators to repeat their duel afloat. We may aptly conclude our survey of the destruction which is invited by any idolization of an ephemeral technique with an illustration that is offered by one of the curiosities of naval history. When the Romans took to the sea in the course of the first Romano-Punic War (*gerebatur* 264-241 B.C.), they had to face a Carthaginian navy which was heir to all the refinements that had been introduced successively into the art of naval warfare in the Mediterranean during the two centuries that had elapsed since the generation of Themistocles. According to the story—whether this be authentic fact or the 'philosophic truth' of legend—the Roman landlubbers nonplussed the Carthaginian masters of the naval art by cancelling two centuries of naval progress at a stroke and reducing naval warfare once again to that primitive kind of land-warfare-on-shipboard which it had been at the beginning of all things. Incapable of meeting the Carthaginians on equal terms in the skilful game of the *διέκπλους* and ruminating regretfully upon their own conspicuous ascendancy on shore, the Romans are said to have invented a gangway, slung from a mast and fitted with a grappling-iron, by means of which they literally came to grips with the Carthaginian warships. By this shockingly unprofessional innovation in technique¹ they seized the

¹ This alleged Roman invention of the *corax* or *corvus* in the fourth decade of the third century B.C. has one well-authenticated precedent in 'the iron hands' with which the Athenian warships grappled the enemy craft in the great battle of 413 B.C. in Syracuse harbour when the Athenian fleet made its supreme effort to break out and gain the open sea. But the circumstances in which this reactionary technique was employed by the fifth-century masters of the art of naval warfare were manifestly exceptional. The engagement was being fought, of necessity, in a confined space, and, since the number of ships engaged was large on either side, there was simply no room for manœuvring (on this point see Thucydides, Book VII, chap. 70). Moreover, the Athenian commander Nicias is represented as describing this reversion to the methods of land-warfare not as a happy idea but as a dismal necessity: *ἐς τοῦτο γὰρ ἠναγκάσμεθα ὥστε πείλομαχέιν ἀπὸ τῶν νεῶν* (Thucydides, Book VII, chap. 62).

tactical initiative, inhibited their astonished and indignant opponents from employing their traditional tactics of manœuvring and ramming, and forcibly substituted the tactics of grappling and boarding, with decisive effects upon the fortunes of the war.

If there is any truth in this story, it brings out the connexion between breakdown and idolatry very clearly; for in this instance we see an intrinsically superior technique which has been idolized by its adepts being defeated by an intrinsically inferior technique which has no point in its favour except that it has not yet had time to be idolized, because it is an innovation; and this strange spectacle suggests very forcibly that it is the act of idolization that does the mischief, and not any intrinsic quality in the object. αἰτία ἐλομένου· θεὸς ἀνάτιος.¹

3. Κόρος, ὕβρις, ἄτη

(α) *The Suicidalness of Militarism.*

The Strong Man Armed.

Having concluded our survey of the aberration of 'resting on one's oars' which is the passive way of succumbing to the nemesis of creativity, we may now go on to examine, by the same empirical method, the active aberration which is described in the three Greek words κόρος, ὕβρις, ἄτη.² In order to bring out the difference between these two modes of courting destruction, let us begin our survey of κόρος-ὕβρις-ἄτη in the military field, in which we have just brought our survey of 'resting on one's oars' to a close.

Both modes are exemplified in the behaviour of Goliath, as this is depicted in the Syriac saga. On the one hand we have seen how Goliath incurs his doom by vegetating in the once invincible military technique of the individual hoplite champion without foreseeing or forestalling the new, and superior, technique which David is bringing into action against him. At the same time we may observe that Goliath's destruction at David's hands might have been postponed, and possibly averted, if only Goliath's unenterprisingness in the matter of technique had been accompanied by a corresponding passivity of *êthos*. Unfortunately for Goliath, however, this *miles gloriosus's* technological conservatism was not offset by the saving grace of 'negative self-feeling'; and he was so blind to the danger to which he was exposing himself by rusting in his obsolete panoply that he actually went out of his way to 'ask for trouble' by offering himself as a champion on behalf of the whole Philistine army, and challenging the enemy to send any man they

¹ Plato: *Respublica*, Book X, 617 E.

² For the distinction between 'resting on one's oars' and κόρος-ὕβρις-ἄτη see IV. C (iii) (c) 1, pp. 257-9, above.

466 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
chose to meet him in single-combat. Thus ὕβρις conspired with unenterprisingness in Goliath's soul to entice the giant to his lamentable fate; and the legendary Syriac figure whose name has become a by-word for 'unpreparedness' is also the prototype of the aggressive 'militarist': a Philip II dispatching his infantry against Holland and his armada against England, or a Napoleon III declaring war on Prussia, or a Wilhelm II invading Belgium 'in shining armour'.¹

The blindness of the militarist is the theme of a famous parable in the New Testament:

'When a strong man armed keepeth his palace, his goods are in peace; but when a stronger than he shall come upon him and overcome him, he taketh from him all his armour wherein he trusted, and divideth his spoils.'²

The militarist is so confident of his own ability to look after himself in that social—or anti-social—system in which all disputes are settled *manu militari*, and not by process of law or conciliation, that he throws his sword into the scales when the issue between a régime of violence and a régime of organized peace is trembling in the balance. The sword's weight duly tips the balance in favour of the continuance of the old barbaric dispensation; and the militarist, exultant at having once more made his will prevail, now points to this latest triumph as a final proof that the sword is omnipotent. In the next chapter of the story, however, it turns out that he has failed to prove his thesis *ad hominem* in the particular case which exclusively interests him; for the next event is his own overthrow by a stronger militarist than himself. His success in prolonging the militarist régime has simply insured that he himself shall learn, at last, what it feels like to have one's throat cut. We may think of the Aztecs and the Incas, each remorselessly warring down their weaker neighbours in their own respective worlds, until they are overtaken by Spanish *conquistadores* who fall upon them from another world and strike them down with weapons for which theirs are no match. It is equally illuminating, and considerably more profitable, to think of ourselves.

In the Hellenic Mythology the doom which 'the strong man armed' invincibly insists upon bringing upon himself is portrayed in the legend of how Cronos brutally supplants his father Uranus in the lordship of the Universe, only to taste, in his turn, of Uranus's experience at the hands of the usurper's own son Zeus.³

¹ This rhetorical expression was used by the German Kaiser to describe the posture in which he gave Austria-Hungary his diplomatic support in the European crisis of 1908 over the Austro-Hungarian annexation of Bosnia.

² Luke xi. 21-2 = Matt. xii. 29 = Mark iii. 27.

³ For the explanation, in mythological language, of how it was that Zeus, the *τριακτῆρ*

In Zeus we have the picture of the militarist who is saved in spite of himself, thanks to the suffering of another being who is nobler, as well as wiser, than he is; and Prometheus' salvation of Zeus is a Hellenic counterpart of Jesus's salvation of Peter when Peter commits the militarist's crime at the crucial moment in the Garden of Gethsemane.

'And, behold, one of them which were with Jesus stretched out his hand and drew his sword and struck a servant of the High Priest's and smote off his ear. Then said Jesus unto him: "Put up again thy sword into his place; for all they that take the sword shall perish with the sword."'¹

In the Old Testament the classic portrayal of the militarist's self-contrived discomfiture is given in the story of Ben-Hadad and Ahab.² When King Ben-Hadad of Damascus is besieging King Ahab of Israel in his city of Samaria, the aggressor sends messengers into the beleaguered city to demand of his victim the surrender of everything that he possesses, and Ahab returns the soft answer: 'My lord, O king, according to thy saying, I am thine and all that I have.' But Ben-Hadad will not forbear from humiliating his humble adversary still further; so he sends a second message to inform Ahab that the conqueror's servants will now come to search his house, and that, 'whatsoever is pleasant in' Ahab's 'eyes, they shall put it in their hand and take it away'. Thereupon Ahab replies that he still accepts the first demand but rejects the second; and, when Ben-Hadad proceeds to breathe fire and slaughter, Ahab says to the bearers of this third message: 'Tell him: "Let not him that girdeth on his harness boast himself as he that putteth it off."' Thereafter, according to Ben-Hadad's will, and against the wishes of Ahab, the issue between the two kings is decided in a pitched battle; and in this battle the aggressor brings upon himself an overwhelming defeat. The story ends with a tableau in which the servants of Ben-Hadad come out—from the city in which they and their master are now being besieged in their turn—with sackcloth on their loins and ropes on their heads, and plead with the victorious Ahab for mercy. And Ahab is not betrayed into making Ben-Hadad's mistake by the giddiness of the *περιπέτεια* that

(see Aeschylus: *Agamemnon*, ll. 171-2, quoted in I. B (v), vol. i, p. 48, above), contrived to avoid the fate of his two predecessors, after having imitated the behaviour of the second of them, see Part III. B, vol. iii, pp. 115-17, above.

¹ Matt. xxvi. 51-2 = Mark xiv. 47 = Luke xxii. 49-51 = John xviii. 10-11. In the passage in the Gospel according to St. John the act of violence is explicitly ascribed to Peter; in the passage in the Gospel according to St. Luke Jesus is represented as also restoring the situation in a material sense by miraculously healing the injured man's wound. (This incident in the story of the Passion of Jesus is touched upon again in V. C (i) (c) 2, vol. v, p. 73; V. C (i) (d) 1, vol. v, p. 393; V. C (ii) (a), vol. vi, pp. 178-9, and V. C (ii) (a), Annex II, vol. vi, pp. 391-2 and 527-8, below.)

² The story is told in 1 Kings xx.

468 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
has so swiftly inverted the two kings' respective positions. To the message 'Thy servant Ben-Hadad saith: "I pray thee, let me live",' Ahab answers: 'Is he yet alive? He is my brother.' And, when, on his instructions, Ben-Hadad is brought with honour into his presence, Ahab makes a treaty with his penitent opponent—on the extremely favourable terms which Ben-Hadad is in haste to offer him—and then straightway lets him go free.

Assyria.

We may next consider the case of the Assyrian militarism which cast its shadow over the Syriac World in Ahab's and Ben-Hadad's generation.¹

The disaster in which the Assyrian military power met its end in 614–610 B.C. was even more overwhelming than those which overtook the Macedonian phalanx in 197 and 168 B.C. or the Roman legions in 53 B.C. and A.D. 378 or the Egyptian Mamlūks in A.D. 1516–17 and A.D. 1798. The disaster at Pydna cost Macedon her political independence; the disaster at Adrianople was surmounted by the Roman Empire at the price of 'scrapping' the defeated legionary and enlisting the victorious cataphract in his place; the French repetition of the original Ottoman blow was needed in order to remove the Mamlūk incubus, once for all, from the backs of an Egyptian peasantry which managed to survive the French and the Ottoman as well as the Mamlūk domination. On the other hand the disaster which was the end of the Assyrian military power capped the destruction of the Assyrian war-machine with the extinction of the Assyrian state and the extermination of the Assyrian people. In 614–610 B.C. a community which had been in existence for more than two thousand years,² and had been playing an ever more dominant part in South-Western Asia over a period of some two and a half centuries, was blotted out almost completely.

'The noise of a whip and the noise of the rattling of the wheels and of the prancing horses and of the jumping chariots.

'The horseman lifteth up both the bright sword and the glittering spear; and there is a multitude of slain and a great number of carcases; and there is none end of their corpses—they stumble upon their corpses. . . .

'Thy shepherds slumber, O King of Assyria; thy nobles shall dwell in

¹ In 853 B.C. Ben-Hadad and Ahab were fighting side by side against Shalmaneser III at the Battle of Qarqar (see IV. C (ii) (b) 1, p. 67, above; the present chapter, p. 473, footnote 3, and p. 475; and V. C (ii) (b), vol. vi, p. 303, below).

² For the appearance of the Assyrians in the 27th century B.C. upon the stage of Sumeric history in the rôle of pioneers who had been conquering a commercial empire by the arts of peaceful penetration, see I. C (i) (b), vol. i, p. 110, footnote 3, above.

the dust; thy people is scattered upon the mountains, and no man gathereth them.'¹

In this instance the curse of the victim who had lived to see his oppressor's fall was fulfilled in the sequel with an extraordinary precision.² In 401 B.C., when Cyrus the Younger's ten thousand Greek mercenaries were retreating up the Tigris Valley from the battle-field of Cunaxa towards the Black Sea coast, they passed in succession the sites of Calah and Nineveh, and were struck with astonishment, not so much at the massiveness of the fortifications and the extent of the area which they embraced, as at the spectacle of such vast works of Man lying uninhabited. The weirdness of

¹ Nahum iii. 2-3 and 18. The burden of Nineveh is the whole theme of the book of the vision of Nahum the Elkoshite. The great event which evoked this paean of exultation from one of the victims of the vanquished Assyrian monster is described more briefly and dryly in the records of the Power which played the leading part in bringing Assyria to the ground. 'A great havoc of the people and the nobles took place; . . . they carried off the booty of the city, a quantity beyond reckoning; they turned the city into ruined mounds' is the account of the transaction that is given by the Babylonian Chronicle (quoted in *The Cambridge Ancient History*, vol. iii (Cambridge 1925, University Press), p. 127).

² It is instructive to compare with Nahum's exultation over the fall of Assyria a passage (Isaiah xiv. 4-12) in the same *genre* in which a later Syriac poet exults over the subsequent fall of Assyria's Babylonian 'successor-state', which had assumed Assyria's sinister role as far as the few then still surviving independent states in Syria were concerned.

'How hath the oppressor ceased! the golden city ceased!

'The Lord hath broken the staff of the wicked and the sceptre of the rulers.

'He who smote the people in wrath with a continual stroke, he that ruled the nations in anger, is persecuted, and none hindereth.

'The whole Earth is at rest and is quiet; they break forth into singing.

'Yea, the fir trees rejoice at thee, and the cedars of Lebanon, saying: "Since thou art laid down, no feller is come up against us."

'Hell from beneath is moved for thee to meet thee at thy coming: it stirreth up the dead for thee, even all the chief ones of the Earth; it hath raised up from their thrones all the kings of the nations.

'All they shall speak and say unto thee: "Art thou also become weak as we? Art thou become like unto us?"

'Thy pomp is brought down to the grave, and the noise of thy viols; the worm is spread under thee, and the worms cover thee.

'How art thou fallen from heaven, O Lucifer, son of the morning! How art thou cut down to the ground, which didst weaken the nations!

In sheer poetic power this passage surpasses—at any rate in the seventeenth-century English version—the corresponding passages of Nahum; and in this we may discern a reflexion of the special experience of Judah; for Judah—in common with Tyre but unlike the great majority of the Syrian communities of the age—happened to suffer more cruelly at the hands of Assyria's Babylonian 'successor-state' than at the hands of Assyria herself. On the whole, however, the militarism of the Neo-Babylonian Empire, in spite of being in the Assyrian vein, was a mild affair compared with the Assyrian militarism which it replaced; and, notwithstanding the evil reputation which has been fastened upon him by his Jewish victims, Nebuchadnezzar, as well as Nabonidus, was much less addicted to the arts of war than to those of peace. In the light of this fact it is interesting to observe that this prophecy against Babylon in the Book of Isaiah was not confirmed so signally as Nahum's prophecy against Assyria was by the march of events. It is true that Babylon fell to Cyrus in 539 B.C. as Nineveh had fallen to Nabopolassar and Cyaxares in 612 B.C.; but there is no comparison between the two events. So far from being annihilated by Cyrus, the city of Babylon lived on to rise up in revolt against Darius and Xerxes, to welcome Alexander with open arms, and to enjoy an 'Indian Summer' of intellectual fraternization with Hellas before she peacefully faded out of existence—or, rather, drifted across from the banks of the Euphrates to the neighbouring banks of the Tigris, in order to become Seleucia-Ctesiphon—in the last century B.C., some five hundred years after her annihilation had been proclaimed in the Jewish poem here quoted.

these empty shells, which testified by their inanimate endurance to the vigour of a vanished life, is vividly conveyed by the literary art of a member of the Greek expeditionary force who has recounted its experiences. Yet what is still more astonishing to a modern Western reader of Xenophon's narrative¹—acquainted, as he is, with the history of Assyria, thanks to the achievements of our modern Western archaeologists—is to find that, although Xenophon's imagination was deeply struck, and his curiosity keenly aroused, by the mystery of these deserted cities, he was unable to learn even the most elementary facts about their authentic history. Although the whole of South-Western Asia, from Jerusalem to Ararat and from Elam to Lydia, had been dominated and terrorized by the masters of these cities at a Time-distance of little more than two centuries from the date at which Xenophon passed that way, the best account that he is able to give of them—presumably on the authority of the Greek army's local guides—is more wildly fabulous than the account of the Egyptian Pyramid-Builders which has found its way into the work of Herodotus² after having travelled in the solvent waters of the stream of 'folk-memory'³ for the length of little less than two and a half millennia. As Xenophon heard the story of Calah and Nineveh, these were two cities of the Medes which had been besieged by the Persians when Cyrus was wresting the empire from Astyages, and had been miraculously depopulated by divine intervention after the Persians had found themselves unable to take them by storm. Not even the bare name of Assyria was associated with the sites of her second and third capitals in the current legends, attaching to these sites, which came to the ears of the passing Greek inquirer.

'Where is the dwelling of the lions and the feedingplace of the young lions, where the lion, even the old lion, walked, and the lion's whelp, and none made them afraid?'⁴

As a matter of fact, if the Ten Thousand had happened to march up the right bank of the Tigris, instead of crossing, as they did, to the left bank at Sittace on the Babylon-Susa road, they would have passed the site of Asshur—the first and eponymous capital of the *Assyrium nomen*—and here they would have found, still squatting among the ruins,⁵ a small and miserable population that had not yet forgotten its historical title to the Assyrian name.⁶ Yet

¹ Xenophon: *Expedition of Cyrus*, Book III, chap. iv, §§ 7-12.

² See III. C (i) (d), vol. iii, p. 214, above.

³ The operation of 'folk-memory' is examined in V. C (ii) (a), Annex II, vol. vi, pp. 438-64, below.

⁴ Nahum ii. 11.

⁵ The city of Asshur was taken and sacked by the Medes in 614 B.C., two years before the sack of Nineveh.

⁶ See *The Cambridge Ancient History*, vol. iii (Cambridge 1925, University Press), p. 130.

Xenophon's fabulous account of Calah and Nineveh is nearer to 'the philosophic truth' than our own archaeologists' discovery of the traces left by the squatters at Asshur; for in substance the catastrophe of 614-610 B.C. did wipe Assyria out; and in the Achaemenian Empire of Xenophon's day the surviving Assyrian helots were incomparably less conspicuous than the vestiges of the peoples round about, whom the Assyrian militarists had once trampled under foot and ground, as they thought, to powder. In an age when the very name and nationality of Nineveh or Calah were forgotten, Susa, which had been sacked by Asshurbanipal's army *circa* 639 B.C., was the capital of an empire whose effective dominion now extended, in almost every direction, an immense distance beyond the farthest points ever reached by Assyrian raiders. One of the subsidiary capitals of this empire was Babylon, which had been sacked by Sennacherib in 689 B.C. The Phoenician city-states, which the Assyrians had incessantly bullied and fleeced from the ninth century to the seventh, were now autonomous and contented members of a Syriac universal state;¹ and even the Syriac and Hittite communities of the interior, which had apparently been pounded into pulp by the Assyrian flail, had contrived to retain a semblance of their former statehood in the guise of hierocratically administered temple-states.² In fact, within two centuries of Assyria's fall it had become clear that the Assyrian militarists had done their work for the benefit of others, and for the greatest benefit of those whom they had used the most despitefully. In grinding down the highland peoples of the Zagros and the Taurus the Assyrians had opened a passage for the Cimmerian and Scythian Nomads to make their descent upon the Babylonian and Syriac worlds;³ in deporting the broken peoples of Syria to the opposite extremity of their empire they had placed the Syriac Society in a position to encircle and eventually assimilate the Babylonian Society to which the Assyrians themselves belonged;⁴

¹ See V. C (i) (c) 2, vol. v, p. 123, footnote 2, below.

² See *The Cambridge Ancient History*, vol. iv (Cambridge 1926, University Press), pp. 187-8; Tarn, W. W.: *Hellenistic Civilisation* (London 1927, Arnold), pp. 114-16. The temple-state about which we have by far the fullest information, and which is also of unparalleled historical importance, is the one which was organized round the temple of Yahweh at Jerusalem in the fifth century B.C. But, though uniquely famous, this Judaean hierocracy was only one representative of a class. These post-Assyrian temple-states in South-Western Asia may be compared with the temple-states (Thebes, Heliopolis, Letopolis, Memphis) in the Egyptian World which were the indigenous 'successor-states' of the Egyptian 'New Empire' (see IV. C (iii) (c) 2 (β), p. 422, footnote 3, above, and IV. C (iii) (c) 3 (β), pp. 515-17, below). There is a modern Western analogue of this in the crop of prince-bishoprics which made its appearance side by side with the secular 'successor-states' of the Holy Roman Empire after 'the Great Interregnum', and which ripened to harvest after the tribulation of the Thirty Years' War (see IV. C (iii) (b) 11, pp. 220-1, above).

³ See II. D (v), vol. ii, p. 136, above.

⁴ See I. C (i) (b), vol. i, pp. 79-81, and II. D (v), vol. ii, pp. 137-8, above, and V. C (i) (c) 2, vol. v, pp. 122-3, below.

472 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
in imposing a political unity upon the heart of South-Western Asia by main force they had prepared the ground for their own 'successor-states'—Media, Babylonia, Egypt, and Lydia—and for these successors' common heir, the Achaemenian Empire. Why was it that in the sequel to the long Assyrian terror the monster came off, as these comparisons and contrasts show, so very much worse than his victims?

The victims themselves, in retrospect, could only explain this tremendous *περιπέτεια* by invoking 'the Envy of the Gods'.

'Behold, the Assyrian was a cedar in Lebanon with fair branches and with a shadowing shroud and of an high stature; and his top was among the thick boughs. . . .

'The cedars in the garden of God could not hide him; the fir trees were not like his boughs, and the chesnut trees were not like his branches; nor any tree in the garden of God was like unto him in his beauty.

'I have made him fair by the multitude of his branches, so that all the trees of Eden, that were in the garden of God, envied him.

'Therefore thus saith the Lord God: "Because thou hast lifted up thyself in height, and he hath shot up his top among the thick boughs, and his heart is lifted up in his height—

"I have therefore delivered him into the hand of the mighty one of the heathen; he shall surely deal with him; I have driven him out for his wickedness.

"And strangers, the terrible of the nations, have cut him off and have left him; upon the mountains and in all the valleys his branches are fallen; and his boughs are broken by all the rivers of the land; and all the people of the Earth are gone down from his shadow and have left him."'

Are we able in this instance to interpret the working of 'the Envy of the Gods' in terms of the stricken creature's own behaviour? At first sight the fate of Assyria does, indeed, seem difficult to comprehend; for her militarists cannot be convicted of the passive aberration to which we have attributed the undoing of the Macedonians and the Romans and the Mamlûks, who 'rested on their oars'. At the time when the Mamlûk and Roman and Macedonian war-machines each met with its fatal accident they were each of them long since static, hopelessly obsolete, and shockingly out of repair. On the other hand the Assyrian war-machine, which is singled out by the completeness of its final disaster, is also distinguished from these other war-machines—in what would seem to be the opposite sense—by the efficiency with which it was being perpetually overhauled and renovated and reinforced right down to the day of its destruction.² The fund of military genius which

¹ Ezekiel xxxi. 3 and 8-12.

² See Hunger, J.: *Heerwesen und Kriegsführen der Assyrier auf der Höhe ihrer Macht* = *Der Alte Orient*, 12 Jahrgang, Heft 4 (Leipzig 1911, Hinrichs), p. 34.

produced the embryo of the hoplite in the fourteenth century B.C.,¹ on the eve of Assyria's first bid for predominance in South-Western Asia, and the embryo of the cataphract horse-archer in the seventh century B.C.,² on the eve of Assyria's own annihilation, was also productive throughout the seven intervening centuries, and never more so than in the final paroxysm of the four historic bouts in which the Assyrian militarism discharged itself upon the World.³ The energetic inventiveness, and the restless zeal for improvements, which were the notes of the latter-day Assyrian *ethos* in its application to the Art of War, are attested unimpeachably by the series of bas-reliefs, found *in situ* in the royal palaces, in which the successive phases of the Assyrian military equipment and technique during the last three centuries of Assyrian history are recorded pictorially with careful precision and in minute detail.

On this evidence we can detect the following improvements between the end of the third bout, *circa* 825 B.C., and the end of the fourth bout just over two hundred years later. The mounted infantryman of Assurnazirpal's day, who had been placed on horseback—no doubt, in imitation of the Nomads—without being relieved of the encumbrance of his infantryman's shield, has now turned into an embryonic cataphract who has discarded the shield in exchange for a flexible cuirass.⁴ This equipment of the cavalry with body-armour has been made feasible by an improvement in the shape and material of the cuirass itself, which is now made of metal scales and is cut off at the waist, in substitution for the clumsy wadded or leathern kaftan, reaching from the neck to the knees, which had done duty for a cuirass in the earlier age.⁵ The cavalryman's legs, which are thus left exposed, are protected in compensation by stockings reaching to the thighs and boots reaching to the calf; and the same footgear enables the infantry to operate in rough country with greater ease than in an age when

¹ See III. C (i) (b), vol. iii, p. 165, footnote 1, and IV. C (iii) (c) 2 (y), in the present volume, p. 431, footnote 2, above.

² See IV. C (iii) (c) 2 (y), p. 439, footnote 4, above.

³ The first bout is signalized by the successive Assyrian offensives against the Mitannian Power in Mesopotamia and the Kassite Power in Babylonia in the fourteenth century B.C., and by Shalmaneser I's well-timed attack upon the Hittite World in the third decade of the thirteenth century, when Khatti was within an ace of breaking down under the long strain of her hundred years' war with 'the New Empire' of Egypt. The second bout is marked by Tiglath-Pileser I's momentary expansion to the Syrian coast of the Mediterranean at the turn of the twelfth and eleventh centuries. The third bout begins with Assurnazirpal's repetition of Tiglath-Pileser I's exploit in 876 B.C., continues in Shalmaneser III's systematic and sustained attempt to complete the conquest of Syria, and gradually subsides, in the second half of the ninth century, after the check administered to Shalmaneser by the Syrian coalition at the Battle of Qarqar in 853 B.C. (see the references on p. 468, footnote 1, above). The fourth bout begins with the accession of Tiglath-Pileser III in 745 B.C. and goes on crescendo until the career of Assyria is cut short for ever in the grand finale of 614-10 B.C.

⁴ Hunger, *op. cit.*, p. 11. See also the present Study, IV. C (iii) (c) 2 (y), p. 439, footnote 4, above.

⁵ Hunger, *op. cit.*, p. 17.

sandals had been the only alternative to going barefoot.¹ Within the same span of Time there have been a number of improvements in the war-chariots: for instance, an increase in the diameter of the wheels, in the height of the sides of the body, and in the number of the crew—the driver and the archer being now reinforced by a couple of shield-bearers.² There has also been an improvement in the shape of the wicker screens from behind which the foot-archers shoot.³ Perhaps the greatest improvement of all, however, is one of which we are informed, not by the pictorial evidence of the bas-reliefs, but by the written word of the inscriptions; and this is the institution of a royal standing army, which was probably the work of either Tiglath-Pileser III (*regnabat* 747–727 B.C.) or Sargon (*regnabat* 722–705 B.C.). The standing army served as a nucleus, and not as a substitute, for the national militia on which the Assyrian Crown had previously depended for the recruitment of its field armies. Nevertheless the establishment of a standing army must have raised the general level of Assyrian military efficiency, and have insured that the technical improvements, mentioned above, should produce the maximum of effect.

By Asshurbanipal's time (*regnabat* 669–626 B.C.), on the eve of the great catastrophe, two centuries of steady progress in the Art of War had produced an Assyrian army which was as well prepared for every task as it was scientifically differentiated into a number of specialized arms. There were the chariotry and the demi-cataphract horse-archers; the heavy foot-archers, armoured from helmet to boots, and the light foot-archers who risked their lives in head-bands, loin-cloths, and sandals; the hoplites, armed like the heavy foot-archers, except that they carried spear and shield instead of bow and quiver; and the peltasts, likewise carrying spear and shield, but wearing, in lieu of a cuirass, a pectoral secured by crossed shoulder-straps.⁴ There was probably also a corps of engineers, for there was certainly a siege-train—not, indeed, of catapults, but of battering-rams and rolling towers—and, when these engines had done their work, and the walls of the enemy fortress had been breached, the Assyrian directors of military operations knew how to cover the storming parties with volleys of arrows from massed batteries of archers. Thus fitted out, the Assyrian army was equally ready for siege operations, for mountain warfare, or for pitched battles on the plains; and its activism in the sphere of technique

¹ Hunger, *op. cit.*, p. 11.

² *Ibid.*, pp. 8–10.

³ *Ibid.*, p. 14.

⁴ In Asshurbanipal's reign the Assyrian peltasts were further differentiated from the hoplites by being equipped with a crested helmet of an Urartian pattern akin to the Hellenic type, in lieu of the conical helmet which was the native Assyrian military headgear (*The Cambridge Ancient History*, vol. iii, p. 20).

was matched by an activism in tactics and strategy. The Assyrians were firm believers in the sovereign virtue of the offensive.¹

'None shall be weary nor stumble among them; none shall slumber nor sleep; neither shall the girdle of their loins be loosed, nor the latchet of their shoes be broken;

'Whose arrows are sharp, and all their bows bent, their horses' hoofs shall be counted like flint, and their wheels like a whirlwind;

'Their roaring shall be like a lion, they shall roar like young lions; yea, they shall roar and lay hold of the prey, and shall carry it away safe, and none shall deliver it.'²

This was the spirit of the Assyrian army down to the last, as was shown by the account which it gave of itself in the Harran campaign of 610 B.C., when it was fighting for a lost cause, with the capital city of the Empire already taken by storm and blotted out. It will be apparent that the Assyrian army on the eve of its annihilation was not at all in the condition of the Macedonian and Roman and Mamlūk armies in 168 B.C. and A.D. 378 and A.D. 1798. Why, then, did it suffer a more appalling disaster than theirs? The answer is that the very activism of the Assyrian military spirit aggravated Assyria's doom when at last it closed in upon her.

In the first place the policy of the unremitting offensive, and the possession of a potent instrument for putting this policy into effect, led the Assyrian war-lords in the fourth and last bout of their militarism to extend their enterprises and commitments far beyond the limits within which their predecessors had kept. Assyria, as we have seen,³ was subject to a perpetual prior call upon her military resources for the fulfilment of her task as warden of the marches of the Babylonian World against the barbarian highlanders in the Zagros and the Taurus on the one side and against the Aramaean pioneers of the Syriac Civilization on the other. In her three earlier bouts of militarism she had been content to pass from the defensive to the offensive on these two fronts, without pressing this offensive *à outrance* and without dissipating her forces in other directions. Even so, the third bout, which occupied the two middle quarters of the ninth century B.C., evoked in Syria the temporary coalition of Syrian states which checked the Assyrian advance at Qarqar in 853 B.C.,⁴ and it was met in Armenia by the more formidable *riposte* of the foundation of the Kingdom of Urartu, an ex-barbarian military Power which now borrowed the Assyrians' culture in order to equip itself for resisting their aggression on equal terms.⁵ In spite of these recent warnings, Tiglath-Pileser

476 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
III (*regnabat* 746-727 B.C.), when he inaugurated the last and greatest of the Assyrian offensives, allowed himself to harbour political ambitions and to aim at military objectives which brought Assyria into collision with three new adversaries—Babylonia, Elam, and Egypt—each of whom was potentially as great a military power as Assyria herself.

Tiglath-Pileser put a conflict with Egypt in store for his successors when he set himself to complete the subjugation of the petty states of Syria; for Egypt could not remain indifferent to an extension of the Assyrian Empire up to her own Asiatic frontiers, and she was in a position to frustrate or undo the Assyrian empire-builders' work unless and until they made up their minds to round it off by embarking on the more formidable enterprise of subjugating Egypt herself. Tiglath-Pileser's bold occupation of Philistia in 734 B.C. may have been a strategic master-stroke which was rewarded by the temporary submission of Samaria in 733 and the fall of Damascus in 732. But it led to Sargon's brush with the Egyptians in 720, and Sennacherib's in 700, on the Syro-Egyptian border; and these inconclusive encounters led on, in their turn, to Esarhaddon's conquest and occupation of Egypt, from the Delta to the Thebaid inclusive, in the campaigns of 675 and 674 and 671 B.C. Thereupon it became manifest that while the Assyrians were strong enough to rout Egyptian armies and occupy the land of Egypt and repeat the feat, they were not strong enough to hold Egypt down. Esarhaddon himself was once more on the march for Egypt when death overtook him in 669; and though the Egyptian insurrection which then broke out was successfully suppressed by Assurbanipal in 667, he had to reconquer Egypt once again in 663. By this time the Assyrian Government itself seems to have realized that in Egypt it was engaged on Psyche's Task; and when Psammetichus unobtrusively expelled the Assyrian garrisons in 658-651 Assurbanipal turned a blind eye to what was happening. In thus cutting his Egyptian losses the King of Assyria was undoubtedly wise; yet this wisdom after the event was a confession that the energies expended on five Egyptian campaigns had been wasted; and Assurbanipal's withdrawal did not restore the *status quo ante* 675 B.C.; for the loss of Egypt in the fifth decade of the seventh century was a prelude to the loss of Syria in the next generation.

The ultimate consequences of Tiglath-Pileser's intervention in Babylonia were far graver than those of his forward policy in Syria, since they led, by a direct chain of cause-and-effect, to the catastrophe of 614-610 B.C.¹

¹ This Assyro-Babylonian conflict has been touched upon, by anticipation, in II. D (v), vol. ii. pp. 135-6, and in IV. C (ii) (b) 2, in the present volume, pp. 101-2, above.

This Assyrian aggression in this quarter in 745 B.C. must have been difficult to reconcile with the treaty in which the Assyro-Babylonian frontier had been delimited by friendly agreement—and this along a line which was decidedly favourable to Assyria—in the opening decade of the eighth century B.C. Probably Tiglath-Pileser justified his action on the ground that the anarchy into which Babylonia had since fallen was spreading to the Assyrian side of the border; and, after marching in, he appears to have received some kind of mandate from the citizens of Babylon, who saw in this sovereign of a neighbouring sedentary kingdom of kindred culture a possible protector of civic life in Babylonia against the rising tide of local Aramaean and Chaldaean Nomadism. It may also be true that both Tiglath-Pileser and his successors were genuinely anxious to restrict the Assyrian commitments in Babylonia to a minimum, and to avoid annexation. Tiglath-Pileser himself in 745 left Nabopolassar, the reigning king of Babylonia, on his throne; and it was only after Nabopolassar's death eleven years later, and after the subsequent suppression of a consequent Chaldaean tribal insurrection against the Assyrian protectorate, that Tiglath-Pileser 'took the hands of Bel' in 729. This precedent was followed by Shalmaneser V; but it was not followed by Shalmaneser's successor Sargon until a second, and far more serious, Chaldaean insurrection forced Sargon, in his turn, to 'take the hands of Bel' in 710; and, even then, the Assyrian victor sought an understanding with the discomfited Chaldaean arch-insurgent Merodach-Baladan. Thereafter, when Sennacherib succeeded his father Sargon in 705, he deliberately abstained from assuming the Babylonian Crown; and, even when a fresh Chaldaean insurrection necessitated his intervention in Babylonia in 703, he conferred the Babylonian Crown first upon an Assyrianized Babylonian prince, and then upon an Assyrian prince who was not himself the heir to the Assyrian Throne. It was only after the great insurrection of 694-689 that Sennacherib formally put an end to the independence of Babylonia by installing his own son—and designated successor—Esarhaddon as Assyrian governor-general.

These facts certainly seem to testify to an Assyrian policy of moderation *vis-à-vis* Babylonia; but they afford still more conclusive evidence that the policy was a failure. Again and again the Assyrian Government's hand was forced by Chaldaean insurrections which only became more frequent and more formidable in the face of persistent Assyrian forbearance. And while the Assyrian intervention did perform the miracle of conjuring order out of a Babylonian chaos, this order, so far from being achieved under an Assyrian aegis, was the by-product of an anti-Assyrian

478 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
movement which steadily grew in scope and lustily throve upon defeat.

The first stage in a process which continued for a century and culminated in a Medo-Babylonian grand alliance was the political unification of all the Chaldaean tribes of Babylonia between 731 and 721 B.C. under the leadership of the Chief of Bit Yakin, Merodach-Baladan. The next stage was an alliance between the Chaldaeans and the Kingdom of Elam, whose Government had been as seriously alarmed by Tiglath-Pileser's intervention in Babylonia as the Egyptians had been alarmed by his descent upon Philistia. Thanks to this Elamite alliance, Merodach-Baladan was able to enter the City of Babylon in 721 and to reign there as king of Babylonia for some twelve years, in spite of the fact that at this stage the citizens of the capital still felt the rule of the local Nomad more irksome than that of the foreign sedentary Power. Nor was Merodach-Baladan's career at an end when he was ejected from Babylon by the armies of Sargon in 710. After his Assyrian conqueror's death in 705 we find the indefatigable Chaldaean entering into relations with the Arabs of the Shāmiyah and the Hamād, and sending an embassy across their ranges to so distant a fellow enemy of Assyria as the King of Judah, Hezekiah. Thereafter, in 703, Merodach-Baladan succeeded in re-occupying Babylon with the aid of his Elamite allies; and although before the year was out he was ejected for the second time by force of Assyrian arms, and died a few years later as a refugee in Elam, the removal of the Chaldaean leader brought the Assyrian Government no nearer to a solution of the Chaldaean problem; for, with Elam still supporting them, the Chaldaean tribesmen successfully defied Sennacherib's efforts to put them out of action. When the Assyrian war-lord occupied and devastated their tribal lands in Babylonia proper, they took refuge among the marshes and mud-banks at the head of the Persian Gulf; and, when in 694 he built a fleet on the Tigris, manned it with Phoenician crews, and put the Assyrian army on board in order to destroy the Chaldaeans in their aquatic fastness by amphibious operations, he merely gave the Elamites the opportunity to fall upon his line of communications, enter Babylon, and carry his puppet-king of Babylonia away captive. Nor did it profit Sennacherib when he took his revenge next year by defeating the Elamites in the field and capturing, in his turn, the puppet whom they had set upon the Babylonian throne in his own puppet's place; for he failed to re-occupy Babylon; and the vacant throne was mounted by a man of character, Mushezib-Marduk, who succeeded in weaning the citizens of the capital from their pro-Assyrian policy.

This secession of the City of Babylon in 693 from the Assyrian to the Chaldaeo-Elamite camp was perhaps the decisive event in the long process of building up an anti-Assyrian front; for although the Assyrians were, as usual, victorious over the combined Chaldaean and Elamite forces, and were able in the end to teach Babylon a lesson by sacking her in 689, the lesson which she learnt was the opposite of that which her teachers intended. Through this impious outrage upon a city which was the cultural capital of their world, the Assyrians achieved a feat of political alchemy in Babylonia which the Babylonians could never have achieved for themselves. In the white heat of the common hatred which this Assyrian 'frightfulness' had now aroused among the ancient urban population as well as among the intrusive Nomads, citizens and tribesmen forgot the mutual antipathy which had hitherto divided them, and became fused together into a new Babylonian nation which could neither forget nor forgive what it had suffered at Assyrian hands, and which could never rest until it had brought its oppressor to the ground.

At this penultimate stage of the long and tragic process which Tiglath-Pileser III had unwittingly set in motion in 745 B.C., the anti-Assyrian feeling in Babylonia was so strong that it was able to dominate, and bend to its purpose, the soul of an Assyrian prince-of-the-blood who had been placed upon the Babylonian throne by *force majeure* and who was actually the brother of the reigning king of Assyria itself. Circa 654 B.C. Asshurbanipal found the existence of the Assyrian Empire threatened by a hostile coalition between the Babylonian Crown, the Chaldaean and Aramaean tribes of the Babylonian country-side, the Kingdom of Elam, the Northern Arabs, several South Syrian principalities, and the recently established 'successor-state' of the defunct Assyrian dominion over Egypt. This combine of anti-Assyrian forces, which was wider than any that had ever been brought together by Mero-dach-Baladan or by Mushezib-Marduk, was headed by Asshurbanipal's own brother, Shamash-shum-ukin; and his action will appear the more extraordinary when we consider that by that date he had been in peaceful occupation of the Babylonian Throne, with Asshurbanipal's goodwill, for some fifteen years, in execution of their father Esarhaddon's political testament. Moreover the arch-rebel's principal ally, Elam, had just received—perhaps as recently as the very year before Shamash-shum-ukin staked his fortunes on her support¹—the heaviest defeat that had ever yet been inflicted upon her by Assyrian arms, a defeat in which the reigning king

¹ Asshurbanipal overthrew Teumman in 655 B.C.; Shamash-shum-ukin revolted against Asshurbanipal circa 654-653 B.C.

480 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
and his heir-apparent had been killed and both the royal cities captured. These facts give the measure of the strength of the Babylonian national movement that swept Shamash-shum-ukin off his feet.

In this crisis the Assyrian army was victorious once again. The traitor Shamash-shum-ukin escaped a worse fate by burning himself alive in his palace when Babylon was starved into surrender in 648; and *circa* 639 Elam was dealt such an annihilating blow by Assyrian arms that her derelict territory passed under the dominion of the Persian highlanders from her eastern hinterland and became the jumping-off ground from which the Achaemenidae leapt into an empty saddle when they made themselves masters of all South-Western Asia a century later. This sacrifice of the Babylonian nationalists' Assyrian and Elamite instruments in the war of 654-639 B.C. did not, however, prevent the Babylonian national movement itself from attaining its objective; for, if the Achaemenidae found the saddle empty in the sixth century, this was because the Assyrian rider had been thrown at last before the seventh century was out. Immediately after Asshurbanipal's death in 626 Babylonia revolted again under a new national leader; and this Nabopolassar completed the work which Merodach-Baladan had begun. In the new Kingdom of Media he found a more potent ally to fill the place of the defunct Kingdom of Elam; and Assyria, who had not recovered from the War of 654-639, was wiped out of existence in the war of 614-610 B.C. Even then, *in extremis*, the Assyrian army could still win victories in the field. With the help of Assyria's former vassals and present patrons the Saites, it drove the Babylonians back upon Harran in 610, at a stage in this war of annihilation when Harran itself, as well as Nineveh and Asshur, was already sacked and devastated, and when the army was fighting with its back to the Euphrates in the last unconquered corner of the Assyrian homeland; but this final victory must have been the Assyrian army's death agony, for this is the last recorded incident in the Assyrian military annals.

When we gaze back over the century and a half of ever more virulent warfare which begins with Tiglath-Pileser III's accession to the throne of Assyria in 745 B.C. and closes with a Babylonian Nebuchadnezzar's victory over an Egyptian Necho at Carchemish in 605, the historical landmarks which stand out the most prominently at first sight are the successive 'knock-out blows' by which Assyria destroyed entire communities—razing cities to the ground and carrying whole peoples away captive. We think of the sack of Damascus in 732; the sack of Samaria in 722; the sack of Musasir in 714; the sack of Babylon in 689; the sack of Sidon in 677; the

sack of Memphis in 671; the sack of Thebes in 663; the sack of Susa *circa* 639. Of all the capital cities of all the states within reach of Assyria's arm, only Tyre and Jerusalem remained inviolate on the eve of the sack of Nineveh in 612. The loss and misery which Assyria inflicted on her neighbours is beyond calculation; and yet the legendary remark of the canting school-master to the boy whom he is whipping—'It hurts you less than it hurts me'—would be a more pertinent critique of Assyrian military activities than the unashamedly truculent and naïvely self-complacent narratives in which the Assyrian war-lords have presented their own account of their performances for the instruction of Posterity.

The full and bombastic Assyrian record of victories abroad is significantly supplemented by rarer and briefer notices of troubles at home that give us some inkling of the price at which the victories were purchased; and, when we examine this domestic chronicle of Assyria at the height of her military power, we shall no longer find it strange that her victoriousness was eventually the death of her.

An increasing excess of military strain revenged itself in an increasing frequency of palace revolutions and peasant revolts. As early as the close of the second bout of aggression in the ninth century B.C. we find Shalmaneser III dying in 827 with his son on the war-path against him, and Nineveh, Asshur, and Arbela in rebellion. Asshur rebelled again in 763-762, Arrapka in 761-760, Gozan in 759; and in 746 the rebellion of Calah, the Assyrian capital of the day, was followed by the extermination of the ruling dynasty. Tiglath-Pileser III (*regnabat* 745-727 B.C.) was a *novus homo* who could not conceal his provenance under the borrowed cloak of an historic name; and, if he was also the Assyrian Marius, the Roman analogy suggests that the establishment of a professional standing army is to be taken as a symptom of an advanced stage of social disintegration. We know that in the Italy of Marius's day it was the ruin of a warlike peasantry, which had been uprooted from the soil by perpetual calls to military service on ever more distant campaigns, that made a standing army both possible and necessary—possible because there was now a reservoir of unemployed 'man-power' to draw upon, and necessary because these men who had lost their livelihood on the land must be provided with alternative employment if they were to be restrained from venting their unhappiness and resentment through the channel of revolution. We may discern in the establishment of the Assyrian standing army a parallel attempt to find the same military solution for the same social problem. This military solution, however, was no more successful in allaying the domestic troubles of Tiglath-

482 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
Pileser's Assyria than it was in allaying those of Marius's Italy. Tiglath-Pileser's successor Shalmaneser V (*regnabat* 727-722 B.C.) seems to have fallen foul of the City of Asshur, like Tiglath-Pileser's predecessors. Sennacherib in 681 was murdered by one of his own sons, who was apparently hand in glove with the Babylonian nationalists; and we have seen already how Asshurbanipal's throne and empire were threatened by the action of his brother Shamash-shum-ukin, King of Babylon, in 654, when this renegade Assyrian prince placed himself at the head of an anti-Assyrian coalition. Therewith the two streams of domestic *stasis* and foreign warfare merge into one; and after Asshurbanipal's death this swells into a mighty river whose rushing waters bear Assyria away to her now inevitable doom. During the last years of Assyrian history the domestic and the foreign aspect of Assyria's disintegration are hardly distinguishable.¹

The approaching doom cast its shadow over the soul of Asshurbanipal himself in his declining years.

'The rules for making offerings to the dead and libations to the ghosts of the kings my ancestors, which had not been practised, I reintroduced. I did well unto god and man, to dead and living. Why have sickness, ill-health, misery and misfortune befallen me? I cannot away with the strife in my country and the dissensions in my family. Disturbing scandals oppress me alway. Misery of mind and of flesh bow me down; with cries of woe I bring my days to an end. On the day of the City-God, the day of the festival, I am wretched; Death is seizing hold on me and bears me down. With lamentation and mourning I wail day and night; I groan: "O God, grant even to one who is impious that he may see Thy light." How long, O God, wilt Thou deal thus with me? Even as one who hath not feared god and goddess am I reckoned.'²

This confession is remarkable in its unconventionality and moving in its sincerity and even pathetic in its bewilderment, but above all it is illuminating in its blindness. When this mood overtook him, did the last of the Assyrian war-lords never find himself silently reciting that terrible catalogue of cities sacked and peoples wiped out by Assyrian arms—a list which concluded with his own sack of Susa and annihilation of Elam? Or was the burden of this memory so intolerable that the tormented militarist thrust it from him, in desperation, whenever it threatened to overwhelm him?

¹ This ultimate fusion between the foreign wars and the domestic troubles of Assyria is an example of that transference of the field of action from the Macrocosm to the Microcosm which we have studied in III. C (i) (d), vol. iii, pp. 192-217, above. In detail, the transmutation of the Assyro-Babylonian conflict into a civil war between the two Assyrian brothers, King Asshurbanipal of Nineveh and King Shamash-shum-ukin of Babylon, may be compared with the transmutation of the Romano-Punic conflict over Sicily into the Sicilian slave-wars (III. C (i) (d), vol. iii, pp. 198-9, above).

² This passage from Asshurbanipal's own records is quoted in *The Cambridge Ancient History*, vol. iii, p. 127.

His successor Sin-shar-ishkun, at any rate, must have lived through a moment when these haunting recollections closed in on him and would not be denied, as the Athenians were beset by the ghosts of their misdeeds when they received the news of the Battle of Aegospotami.

'At Athens the disaster was announced by the arrival of the *Paralus*,¹ and a wail spread from the Peiraeus through the Long Walls into the city as the news passed from mouth to mouth. That night no one slept. Besides mourning for the dead they mourned far more bitterly for themselves, for they expected to suffer the fate which they had inflicted upon the Melians (who were colonists of the Lacedaemonians) when they had besieged and captured their city, and upon the Histiaeans, the Scionians, the Toronians, the Aeginetans and many other Hellenic peoples. Next morning they held an assembly in which it was decided to block up all the harbours except one, to clear the fortifications for action, to dispose troops to man them, and to put the city into a thorough state of defence for the eventuality of a siege.'²

As the Athenian *dêmos* felt and acted at this dreadful moment in 405 B.C., the last king of Assyria must have felt and acted in 612 B.C., when he received the news that his Scythian allies, who had been his last hope of worldly salvation, had gone over to the enemy and that the united forces of the hostile coalition were closing in irresistibly upon Nineveh. The rest of the story is not the same in the two cases; for the Athenian *dêmos* capitulated and was spared by the generosity of the victors, while King Sin-shar-ishkun in Nineveh stood a siege, held out to the bitter end, and perished with his people when the city was taken by storm at the third assault. Thus the doom which Asshurbanipal had deprecated overwhelmed his successor and was not averted either by Asshurbanipal's tardy contrition or by his partial conversion from the works of War to the arts of Peace. Asshurbanipal's learned library of Babylonian literature (an Assyrian museum of a culture which an Assyrian militarism had blighted) and his exquisite bas-reliefs (designed by living Assyrian artists, and depicting the scientific slaughter of man and beast by the Assyrian military technique) had made of Nineveh by the year 612 B.C. a treasure-house which is not altogether incomparable with the Athens of 405-404. The treasures of Nineveh were buried under her ruins to enrich a remote Posterity in the heyday of a civilization which does not reckon the Babylonian Society among its forebears. But, if Nineveh perished where Athens survived, this was because Assyria had already committed suicide before her material destruction over-

¹ The *Paralus* and the *Salaminia* were the two fastest sailers in the Athenian navy, and were used for carrying dispatches.

² Xenophon: *Hellenica*, Book II, chap. 2, §§ 3-4.

took her. The clearly attested progress of the Aramaic language at the expense of the native Akkadian in the Assyrian homeland during the last century and a half of Assyria's existence as a state shows that the Assyrian people was being peacefully supplanted by the captives of the Assyrian bow and spear in an age when the Assyrian military power stood at its zenith.¹ Depopulation was the price which had to be paid for militarism, and it was a price that was ultimately as ruinous for the Assyrian army as for the rest of the Assyrian body social. The indomitable warrior who stood at bay in the breach at Nineveh in 612 B.C. was 'a corpse in armour', whose frame was only held erect by the massiveness of the military accoutrements in which this *felo de se* had already smothered himself to death. When the Median and Babylonian storming party reached that stiff and menacing figure, and sent it clattering and crashing down the moraine of ruined brickwork into the fosse below, they did not suspect that their terrible adversary was no longer a living man at the moment when they struck their daring, and apparently decisive, blow.

The Burden of Nineveh.

We have sketched our portrait of the Assyrian militarism at full length because it is the prototype of so many signal examples of the same aberration. The tableau of the 'corpse in armour' conjures up a vision of the Spartan phalanx on the battlefield at Leuctra in 371 B.C.,² and of the Janissaries in the trenches before Vienna in A.D. 1683.³ The ironic fate of the militarist who is so intemperate in waging wars of annihilation against his neighbours that he deals unintended destruction to himself recalls the self-inflicted doom of the Carolingians or the Timurids, who built up great empires out of the agony of their Saxon or Persian victims, only to provide rich spoils for Scandinavian or Uzbek adventurers⁴ who lived to see the empire-builders pay for their imperialism by falling from world power to impotence within the span of a single lifetime.

Another form of suicide which the Assyrian example calls to mind is the self-destruction of those militarists—be they barbarians or people of higher culture with a capacity for putting their talents to a better use—who break into, and break up, some universal

¹ See I. C (i) (b), vol. i, p. 79, above, and V. C (i) (c) 2, vol. v, p. 119, and V. C (i) (d) 6 (γ), vol. v, pp. 487-91 and 499, footnote, 2 below.

⁴ For the collapse of the Carolingian Empire see II. D (v), vol. ii, p. 167; II. D (vii), vol. ii, pp. 343-5 and 368; and IV. C (iii) (c) 2 (β), in the present volume, pp. 322-3, above, and the present chapter, pp. 488-90, and IV. C (iii) (c) 3 (β), p. 523, below; for the collapse of the Timurid Empire see I. C (i) (b), Annex I, vol. i, pp. 368-77, and Part III. A, Annex II, vol. iii, p. 447, above.

state or other great empire that has been giving a spell of peace to the peoples and lands over which it has spread its aegis. The conquerors ruthlessly tear the imperial mantle into shreds in order to expose the millions of human beings whom it has sheltered to the terrors of darkness and the shadow of death,¹ but the shadow descends inexorably upon the criminals as well as upon their victims. Demoralized on the morrow of their victory by the splendour and the vastness of their prize, these new masters of a ravished world are apt, like the Kilkenny cats, to perform 'the friendly office' for one another until not one brigand in the band is left alive to feast upon the plunder.²

We may watch how the Macedonians, when they have overrun the Achaemenian Empire, and have pressed on beyond its farther frontiers into India, within the eleven years following Alexander's passage of the Hellespont, next turn their arms with equal ferocity against one another during the forty-two years intervening between Alexander's death in 323 B.C. and the overthrow of Lysimachus at Corupedium in 281 B.C. The grim performance was repeated a thousand years later in another passage of Syriac history, when the Primitive Muslim Arabs emulated—and thereby undid—the Hellenic Macedonians' work by overrunning in twelve years the Roman and Sasanian dominions in South-Western Asia over almost as wide a sweep of territory as had once been conquered in eleven years by Alexander from the Achaemenidae.³ In this Arab case the twelve years of conquest were followed by the twenty-four years of fratricidal strife which began with the assassination of the Caliph 'Uthmān in A.D. 656 and culminated in the martyrdom of the Prophet's grandson Husayn in A.D. 680. Once again the conquerors of South-Western Asia fell on one another's swords; and the glory and profit of rebuilding a Syriac universal state⁴ which Alexander had overthrown was left to the usurping Umayyads and to the interloping 'Abbasids, instead of falling to those

¹ Luke i. 79.

² The proneness of the victorious barbarian war-bands to exterminate one another has been noticed already in I. C (i) (a), vol. i, pp. 58–9, above; see further V. C (i) (c) 3, vol. v, pp. 221–2, below.

³ For the Primitive Muslim Arabs' feat of conquering the Oriental provinces of the Roman Empire with one hand and the whole of the Sasanian Empire with the other hand simultaneously, between A.D. 632 and A.D. 643, see I. C (i) (b), vol. i, p. 73, above. In these twelve years of conquest the Arabs emulated the achievement of the Macedonians in 334–323 B.C. without quite equalling it. While the larger part of the area conquered was the same, the Arabs fell short of their Macedonian predecessors both on the north-west and on the north-east. On the north-west they did not win any permanent foothold in the Anatolian Peninsula; on the north-east they did not begin the conquest of the Oxus-Jaxartes Basin until more than half a century, or complete it until more than a century, had passed since their occupation of the north-eastern frontier fortresses of the Sasanian Empire in A.D. 643–51 (see II. D (vii), vol. ii, pp. 375–84, above).

⁴ For the Arab Caliphate as a 'reintegration' or 'resumption' of the Achaemenian Empire, which had been the first essay in a Syriac universal state, see I. C (i) (b), vol. i, pp. 75–7, above.

companions and descendants of the Prophet whose lightning conquests had prepared the way. The same spectacle is presented in the New World when the Aztecs and the Incas go down before the Spaniards. The Spanish *conquistadores* of the Mexic and the Andean universal state overran two continents—from Florida to the Isthmus, and from the Isthmus to Chile—only to fight over the spoils as ferociously as the companions of Muhammad or the companions of Alexander; and the Macedonian war-lord in his grave was not so powerless to maintain discipline among the troops that had once followed him in the field¹ as was a living sovereign at Madrid to impose the king's peace upon the adventurers who paid him a nominal allegiance on the other side of the Atlantic. The same suicidal Assyrian vein of militarism was displayed by the barbarians who overran the derelict provinces of a decadent Roman Empire. The Visigoths were overthrown by the Franks and the Arabs; the smaller fry among the English 'successor-states' in Britain were devoured by Mercia and Wessex; the Merovingians were brushed aside by the Carolingians, and the Umayyads by the 'Abbasids.² And this suicidal ending of our classic example of a 'heroic age' is characteristic, in some degree, of the latter end of all the *Völkerwanderungen* that have overrun the domains of other decrepit universal states.

There is another variety of militaristic aberration of which we shall also find the prototype in the Assyrian militarism when we envisage Assyria not as an artificially isolated entity in herself, but in her proper setting as an integral part of a larger body social which we have called the Babylonian Society.³ In this Babylonian World Assyria was invested, as we have seen, with the special function of serving as a march whose primary duty was to defend not only herself, but also the rest of the society in which she lived and had her being, against the predatory barbarian highlanders from the east and the north and the aggressive Aramaean pioneers of the Syriac Civilization from the opposite quarters of the compass.⁴ In articulating a march of this Assyrian kind out of a previously undifferentiated social fabric, a society stands to benefit in all its members; for while the march itself is stimulated in so far as it responds successfully to the challenge—which it has now taken upon itself—of resisting external pressures,⁵ the interior—which

¹ In the fratricidal wars between the diadochi of Alexander the royal secretary, Eumenes of Cardia, was able to make good the prestige which he forfeited in the eyes of the Macedonian Argyraspides on account of his own non-Macedonian birth by continuing to pitch the royal tent as though Alexander were still alive and in the army's midst. (See Plutarch's *Life of Eumenes*, chap. 13.)

² See I. C (i) (a), vol. i, p. 58, above.

³ For the sense in which the term is used in this Study see I. C (i) (b), vol. i, pp. 115-19, above.

⁴ See II. D (v), vol. ii, pp. 133-7, above.

⁵ For the stimulus of pressures see II. D (v), *passim*, in vol. ii, above.

the march now shields—is relieved of pressure in a corresponding degree, and is thereby set free to face other challenges and accomplish other tasks. This division of labour is salutary so long as the march continues to direct its specialized military prowess exclusively to its appointed task of repelling the external enemy. So long as they are used for this socially legitimate purpose, the military virtues need not be socially destructive—even though the necessity of bringing them into play at all may be a lamentable testimony to the imperfection of human nature in those generations of men who have been setting their feet upon the lower rungs of the ladder of Civilization during these last six thousand years. But these virtues, such as they are, become fatally transformed into the vice of Militarism, in the sinister sense, if ever the frontiersmen turn the arms which they have learnt to use in warfare with the outsider beyond the pale against the members of their own society whom it is their proper task to defend and not to attack.

The evil of this aberration is not so much that it exposes the society as a whole to the assaults of the external enemy whom the frontiersmen have hitherto kept at bay; for the frontiersmen seldom turn against their own kith and kin until they have established so great an ascendancy over their proper adversaries that their hands are free for other mischief and their ambitions fired for aiming at greater objectives. Indeed, when a march turns and rends the interior of its own society, it usually manages to hold the external enemy off with its left hand while it is waging a fratricidal war with its right. The deadly harm of this misdirection of military energies lies not so much in the opening of the gates to an alien invader—though this is sometimes one of the incidental consequences in the end—as in the betrayal of a trust and in the precipitation of an internecine conflict between two parties whose natural relation with each other is to dwell in unity.¹ When a march turns against its own interior, it is taking the offensive in what is really a civil war; and it is notorious that civil wars are waged with greater bitterness and ferocity than any others. This explains the momentousness of the consequences that ultimately followed from the action of Tiglath-Pileser III in 745 B.C., when he turned his Assyrian arms against Babylonia instead of continuing to exercise them exclusively against Nairi and Aram, which were their legitimate field; and we shall see, from a survey of other instances which this Assyrian prototype calls to mind, that the denouement of the ensuing Assyro-Babylonian hundred years' war, catastrophic as it was,

¹ 'Behold, how good and how pleasant it is for brethren to dwell together in unity' (Psalm cxxxiii. 1) is even more eminently true of the relations between communities than of those between individuals in a human society.

488 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
 was not peculiar to this particular case. The aberration of the march which turns against the interior is, in its very nature, disastrous for the society as a whole; and it is destructive, above all, to the party which commits the original act of ὕβρις. When a sheep-dog who has been bred and trained to be the shepherd's partner lapses into the ethos and behaviour of the wolves whom it is his duty to chevy away, and betrays his trust by harrying the sheep on his own account, he works far worse havoc than any genuine wolf could work so long as a loyal sheep-dog was snapping at his flanks; but at the same time it is not the flock that suffers the most heavily from the catastrophe which follows the sheep-dog's treachery. The flock is decimated but survives; the dog is destroyed by his outraged master; and the frontiersman who turns against his own society is dooming himself to inexorable destruction because he is striking at the source from which his own life springs. He is like a sword-arm that plunges the blade which it wields into the body of which it is a member; or like a woodman who saws off the branch on which he is sitting, and so comes crashing down with it to the ground while the mutilated tree-trunk remains still standing.

Charlemagne.

It was perhaps an intuitive sense of the perversity of this misdirection of energies that moved the Austrasians to protest so vehemently in A.D. 754 against their war-lord Pepin's decision to respond to Pope Stephen's call to arms against their brethren the Lombards. The Papacy had turned its eyes towards this Transalpine Power, and had whetted Pepin's ambition by anointing him king in 749¹ and crowning him on the eve of the projected Italian expedition, because Austrasia in Pepin's generation had distinguished herself by her prowess in serving as a march of Western Christendom on two fronts: against the pagan Saxon barbarians who were pushing their way towards the Rhine from the no-man's-land of Northern Europe,² and against the Muslim Arab conquerors of North-West Africa and the Iberian Peninsula who were pressing on across the Pyrenees.³ In 754 the Austrasians were invited to divert their energies from the fields in which they had just been finding their true mission, and to inflict

¹ The ceremony on this occasion was performed by the Englishman Boniface, the apostle of the Papacy in Transalpine Europe. The subsequent crowning of Pepin in A.D. 754 was performed by the Pope in person at St. Denis.

² See II. D (v), vol. ii, pp. 167-8, above.

³ See II. D (v), vol. ii, pp. 203-4; II. D (vii), vol. ii, pp. 361-2 and 378-81; and II. D (vii), Annex IV, vol. ii, pp. 427-33, above; and V. C (i) (c) 3, vol. v, pp. 221-2, below.

upon the Lombards in Italy the fate which Austrasian arms had prevented the Arabs and the Saxons from inflicting upon the Franks themselves in Gaul. The misgivings of the Austrasian rank-and-file over this Italian adventure were proved by the event to be better justified than their leader's appetite for it; for in overriding the objections of his henchmen King Pepin forged the first link in a chain of military and political commitments which bound Austrasia to Italy ever more tightly. Pepin's Italian campaigns against Aistulf in 755 and 756 led on to Charlemagne's Italian campaign against Desiderius in 773-4—notwithstanding the effort of Charlemagne's mother and Pepin's widow Queen Bertrade to heal a breach between Frank and Lombard which King Pepin had opened against his people's will. When Bertrade arranged a marriage between her own and Pepin's son, who had now succeeded his father, and the daughter of Aistulf's successor Desiderius, Charlemagne repudiated his Lombard wife Desiderata and fulfilled his own father's ambitions by conquering his wife's father's kingdom outright. But Charlemagne's seizure of the Lombard Crown did not dispose of the Italian question or relieve the Transalpine Power of its ultramontane anxieties. In extinguishing the independence of the Lombard Kingdom Charlemagne saddled his own house irrevocably with the burden of defending and controlling the Papacy; and his protectorate over the *Ducatus Romanus* involved him in more distant complications with Lombard principalities and East Roman outposts in the South of Italy. Even when, on the fourth of the expeditions which he was compelled to make to Rome, he attained the apogee of his outward success in being crowned by the Pope, and acclaimed by the Roman people, as Augustus, the honour cost him the annoyance of a diplomatic conflict with the Court of Constantinople which dragged on for more than ten years.¹

The true verdict on Charlemagne's Italian policy is given by the chronological table of the acts of his reign, which shows how these ultramontane commitments repeatedly diverted him—and this often at critical moments—from his major military task of prosecuting the Great Saxon War. After throwing down the gauntlet to the Saxons by marching into the heart of their country, and hewing down the Irminsul, in 772, Charlemagne disappeared beyond the Alps during 773 and 774, and so left the way open for the Saxons in the latter year to take reprisals on Hessen. Thereafter the would-be 'knock-out blow' of 775-6 had to be suspended in the spring of the latter year while the smiter of the Saxons went off on a second ultramontane expedition to put down a rebellion raised by

¹ See IV. C (iii) (c) 2 (β), p. 328, footnote 3, above.

490 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
Hrodgaud, the Lombard Duke of Friuli. In the middle of the next and most formidable phase of the war, in which the Saxons were led for eight years (777-85) by Widukind—a captain whose strategy was the offensive defensive—Charlemagne had to pay the third visit to Italy, and second to Rome, of his reign; and the lull in the Saxon War which followed the submission of Widukind in 785 gave no rest to Austrasian arms, for the year 787 saw Charlemagne pay his third visit to Rome, lead an inconclusive expedition against the South Lombard Duchy of Benevento, and impose his authority by a military demonstration upon the Lombards' old friends, and his own restive vassals, the Bavarians. The fourth and last phase of the Saxon War, in which the conquered but uncowed barbarians made a desperate and long-drawn-out effort to throw off the Austrasian yoke with the aid of the Frisians (*nitebantur* A.D. 792-804), was in progress during Charlemagne's fourth visit to Rome, and fifth to Italy, in 800-1.

We have already had occasion to notice how grievously this war of attrition against the Saxons exhausted the Carolingian Power.¹ The exhaustion declared itself in the break-up of the Carolingian Empire on the morrow of Charlemagne's death, and in the Scandinavian *revanche* for the Saxons' sufferings—a counter-attack which was opened even before the Austrasian conqueror of the Saxons had departed this life. It must also be remembered that the Saxon front beyond the Rhine was not the only frontier of Western Christendom for which Austrasia was responsible; she was likewise the warden of the Arab frontier beyond the Pyrenees; and, when Charlemagne overthrew the Lombard Kingdom and reduced the Bavarians to obedience, he inherited from his vanquished adversaries the wardenship of a third frontier, the Avar front beyond the Styrian Alps. It may have been inevitable that in the second year of his deadly duel with Widukind Charlemagne should have been drawn away into the Transpyrenaean expedition which ended so unfortunately at Roncevaux; but with a Transpyrenaean as well as a Transrhenean front to hold, and with disaffection always smouldering in Aquitaine, it is evident that Charlemagne could not afford in any case to enter into new commitments on the Italian side of the Alps; and his Italian policy became suicidal when it was combined, as it was, with an ambitious forward movement on both the Transalpine fronts which the great Austrasian militarist had inherited from his forebears. It was the wantonly imposed burden of Charlemagne's five Italian expeditions that aggravated to breaking-point the load which weighed upon Austrasia's back.

¹ See the references on p. 484, footnote 4, above.

Timur Lenk.

If Charlemagne broke Austrasia's back by turning her arms against the Lombard and Bavarian interior of a nascent Western Christendom when the whole of her strength was required for her terrific struggle with the Saxons beyond her Rhenish pale, Timur, in like fashion, broke the back of his own Transoxania by squandering in aimless expeditions into Iran and 'Irāq and India and Anatolia and Syria the slender reserves of Transoxanian strength which ought to have been concentrated upon Timur's proper mission of imposing his peace on the Eurasian Nomads.

We have seen in an earlier part of this Study¹ how Timur acquitted himself of that mission. In the course of nineteen years (A.D. 1362-80) of strenuous campaigning he had repulsed the attempts of the Chaghatāy Nomads to reconquer the Transoxanian oases; assumed the offensive in his turn against the foiled invaders on their native ranges in 'Mughalistan'; and rounded off his own dominions in the Eurasian march of the Iranic World by liberating the oases of Khwārizm on the Lower Oxus from the Nomads of Jūjī's appanage. Upon the completion of this great task in A.D. 1380 Timur had a greater prize within his reach—no less a prize than the succession to the Eurasian Empire of Chingis Khan—for in Timur's generation the Eurasian Nomads were in retreat on all sectors of the long frontier between the Desert and the Sown.² While Timur was winning his victory over the hordes of 'Mughalistan' and Qipchāq on the sector between the Pamirs and the Caspian, the Moldavians and Lithuanians³ and Cossacks⁴ were cutting short the appanage of Jūjī at its opposite extremity in the great western bay of the Steppe between the Iron Gates of the Danube and the Cataracts of the Dniepr; the Muscovites were shaking off the yoke of the Qipchāq horde; and the Chinese were driving out the Mongol Khāqāns—the senior branch of Chingis Khan's house, and the nominal overlords of all the Chingisid appanages—from Qubilai's capital at Peking⁵ into a no-man's-land beyond the outer face of the Great Wall from which these barbarian intruders had originally come. In every quarter the Nomads were on the run, and the next chapter in the history of Eurasia⁶ was to be a race between the

¹ Part II. D (v), vol. ii, pp. 146-8, above.

² See Part III. A, Annex II, vol. iii, p. 439, above.

³ See II. D (v), vol. ii, p. 172, above.

⁴ See II. D (v), vol. ii, p. 155, above.

⁵ See II. D (v), vol. ii, p. 121, above, and V. C (i) (c) 4, vol. v, p. 351, and V. C (ii) (a), vol. vi, p. 193, below.

⁶ The word is used in this Study to designate the area covered by the Eurasian Steppe together with the ring of sedentary countries round its fringes that are subject to the Steppe's influence. The region thus defined has a much more genuine climatic, social, and historical individuality than the European and Asiatic continents which loom so large in the text-books of geography; for the Ural River—which every schoolboy knows by name as the boundary between Asia and Europe—is not a frontier in any

resurgent sedentary peoples round about for the prize of Chingis' heritage. In this competition the Moldavians and Lithuanians were too remote to be in the running; the Muscovites were wedded to their forests and the Chinese to their fields; the Cossacks and the Transoxanians were the only competitors who had succeeded in making themselves at home on the Steppes without uprooting the sedentary foundations of their own way of life.¹ Each in their own way, they had acquired something of the strength of Nomadism and had combined this with the strength of a sedentary civilization. To a sharp-eyed observer in A.D. 1380 it might have seemed as though the victory in the race for the dominion of Eurasia must lie between these two runners; and at that moment the Transoxanian competitor had, to all appearance, by far the better chance, for, besides being stronger in himself and nearer to the heart of the Steppe, he was also the first in the field, while, as the recognized champion of the Sunnah, he had potential partisans among the sedentary Muslim communities who were the outposts of Islam on the opposite coasts of the Steppe: in Qāzān and Krim on the one hand, and in Kansu and Shensi on the other.

For an instant Timur appeared to appreciate his opportunity and to grasp at it with determination. The civil war between rival sections of the Qipchāq horde, which had permitted Timur to conquer Khwārizm and the Muscovites to assert their independence, was duly taken advantage of by Timur for a more ambitious purpose than the mere acquisition of a single border province. He intervened in the internal affairs of Qipchāq by giving his support to one of the rival pretenders, Toqatmysh; it was thanks to Timur's aid that Toqatmysh was able in the course of the years 1378-82 to unite the whole of Jūji's appanage under his own leadership, reduce the Muscovites to obedience again by taking and burning Moscow itself, and inflict a heavy defeat upon the Lithuanians.² All this was done by Toqatmysh as Timur's vassal, and the effect was to make Timur master, directly or indirectly, of the whole western half of the Eurasian Steppe with its surrounding sedentary dependencies, from the Irtysh to the Dniepr and from the Pamirs to the Urals. At this juncture, however, the Transoxanian conqueror of the Eurasian no-man's-land suddenly turned right-about, directed his arms towards the interior of the Iranic World, and devoted the remaining twenty-four years of his life to a series of barren and destructive campaigns in this quarter. Even when

significant sense. The genuine frontiers that divide the Eurasian Steppe from China, South-Western Asia, Western Europe, and Russia are described in Part III. A, Annex II, vol. iii, pp. 399-402, above.

¹ For the Cossack way of life see II. D (v), vol. ii, pp. 155-7, above.

² For these events see II. D (v), vol. ii, p. 147, above.

Toqatmysh, emboldened by seeing his suzerain fly off at a tangent, unintentionally drew him back into his proper field through an act of audacious aggression, Timur obstinately resumed his new course as soon as he had disposed of the nuisance in Qipchāq in a winter campaign across the Steppes which was the most brilliant and characteristic *tour de force* in the Transoxanian captain's whole history.¹

A brief exposition of the annals of the last twenty-four years of Timur's life will show how persistently, throughout that span of nearly a quarter of a century, he rejected an opportunity which he had held in the hollow of his hand at the moment of transition from the first to the second phase of his career.

Timur spent the seven years 1381-7 in conquering Iran and Transcaucasia, save for a single punitive expedition in 1383-4 against a still recalcitrant Chaghatāy Khan in 'Mughalistan'. He did not even take warning from a brush between his own troops and Toqatmysh's which occurred in 1385 in Azerbaijan; and at the beginning of 1388 he was in Fars, on the point of rounding off his conquest of the Iranian Plateau, when he was urgently recalled to Samarqand by Toqatmysh's invasion of Khwārizm and Transoxania. His crushing victory over Toqatmysh at Urtapa, on the opposite coast of the Qipchāq Steppe, in 1391 replaced in Timur's hands the opportunity which he had held in 1380 and had neglected since 1381. This time it was in his power to make himself the direct master of Qipchāq and all its dependencies. Moreover, after his triumphal return to Samarqand from Qipchāq at the beginning of 1392, he was able to stamp out the last embers of revolt in 'Mughalistan' and to establish his suzerainty definitively over the Chaghatāy horde. Eurasia now lay at his feet; but instead of stooping to pick up the prize he rode off again, that summer, in the opposite direction, made straight for Fars—that is to say, for the point on his course at which he had been compelled to desist from the conquest of South-Western Asia in 1388—and proceeded systematically with the subjugation of 'Irāq and Armenia and Georgia. In the course of this famous 'Five Years' Campaign' (July 1392-July 1396) Timur once again was drawn, in spite of himself, out of his intended course by a fresh incursion of Toqatmysh into Transcaucasia in the spring of 1395. Timur's counter-stroke carried him across the Caucasus and the Terek and the Steppes into Muscovy;²

¹ For this campaign of A.D. 1391 see loc. cit.

² Timur's incursion into Muscovy on this occasion does not appear to have been carried to the point of occupying the city of Moscow itself, *pace* Sharaf-ad Din 'Alī Yazdī, the Persian historian who recorded Timur's career in the generation following Timur's own (see the *Zafar-Nāmah* (Calcutta 1887-8, *Bibliotheca Indica* series, 2 vols.), vol. i, p. 761). For Sharaf-ad-Din's tutorship over Yunus Khān Chaghatāy of 'Mughalistan' see II. D (v), vol. ii, p. 149, above.

494 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
but in 1396 he retraced his steps from Qipchāq to South-Western Asia, and returned to Samarqand across Iran.

From the summer of 1396 to the spring of 1398 Timur rested at Samarqand from his devastating labours; but this pause was not followed by a consolidation or extension of his hold upon Eurasia. Having now completed the pulverization of the heart of the Iranic World (of which he was himself a child), he set himself next to harry, in turn, its south-eastern and north-western extremities, where the Taghlāqi princes of Hindustan and the 'Osmanli princes of Rūm were at that time extending the Iranic domain at the expense of the Hindu World and Orthodox Christendom respectively. Timur's amīrs objected to crossing the Hindu Kush and attacking their own Turkish kinsmen and co-religionists in India¹ as strongly as the henchmen of Pepin had once objected, in similar circumstances, to crossing the Alps and attacking their Lombard kinsmen in Italy;² but Timur, like Pepin, made his own will prevail.³ The Indian campaign kept him occupied from the spring of 1398 to the spring of 1399; and by the autumn of the latter year he was off again on what was destined to be the most famous, though it was not really the most brilliant, chapter of his military career: a second five years' campaign which included his encounter with the Maghribī philosopher Ibn Khaldūn at Damascus in 1401⁴ and his defeat and capture of the Ottoman Sultan Bāyezīd Yildirim in 1402.⁵

Returning to Samarqand in the July of 1404, Timur was on the war-path again by November; and now at last, for the first time in twenty-three years, his face was deliberately set in an auspicious direction; for his objective, this time, was China; and although it may be doubted, in the light of his record in South-Western Asia, whether he would have repeated the Mongols' feat of conquering China outright—a task which it had taken even the Mongols seventy years (A.D. 1207–77) to complete—nevertheless this latest enterprise of Timur's, had he lived to carry it out, might have had enduring consequences of historical importance; for even a passing raid on China might have left Timur in permanent possession of the eastern sectors of the southern border of the Eurasian Steppe from the Tarim Basin to Manchuria; and that would have placed the whole of the Steppe in his power. At this point, however, we pass into the realm of conjecture; for even a militarist who was

¹ See Lane-Poole, S.: *Medieval India* (London 1903, Fisher Unwin), p. 155.

² See p. 488, above.

³ Timur was doubtless tempted by the anarchy into which the Taghlāqi Power had fallen since the death of Firūz Shah in A.D. 1388. (For Firūz Shah's Slave-household see Part III. A, vol. iii, p. 31, footnote 1, above. For the onset, after Firūz Shah's death, of the second bout of a 'Time of Troubles' in the Hindu World see V. C (ii) (b), vol. vi, p. 301, below.)

⁴ See III. C (ii) (b), vol. iii, p. 327, footnote 3, above.

⁵ See II. D (iv), vol. ii, p. 102, and II. D (v), vol. ii, p. 148, above.

favoured with Timur's lucky star could not throw away twenty-three years with impunity. On his China campaign he had marched no farther eastward than Utrār before Death overtook him.

Timur's self-stultification is a supreme example of the suicidalness of Militarism, as will appear from a comparison between his fiasco and Charlemagne's.

In both cases the attempt of the march to conquer the interior was ephemeral—and indeed it is seldom that a relatively backward community does succeed in assimilating to itself by the crude expedient of military conquest another community which is in advance of it on the same path of civilization. Like the Transoxanian domination which Timur imposed by force of arms upon Iran and 'Irāq, the Austrasian domination which Charlemagne imposed upon Lombardy and Bavaria faded away after the conqueror's death. Yet the effects of Charlemagne's militarism were not altogether transient; for his empire held together in some fashion for three-quarters of a century after his own hand was removed; and the destinies of its several parts were permanently modified through their union into a single body social which lived on, in the shape of a *Respublica Christiana*, long after the evaporation of the military force by which the union had originally been brought about. By contrast, Timur's empire was not only shorter-lived than Charlemagne's but was also without any social after-effects of a positive kind. West of the Caspian Gates it dissolved in A.D. 1405 upon the news of Timur's death; in Khurāsān and Transoxania it broke up into weak and warring fragments after Shah Rukh's death in A.D. 1446;¹ and the only traceable after-effect is wholly negative. In sweeping away everything that it found in its path, in order to rush headlong to its own destruction, Timur's imperialism simply created a political and social vacuum in South-Western Asia; and this vacuum eventually drew the 'Osmanlis and the Safawis into a collision which dealt the stricken Iranic Society its death-blow.

Again, Charlemagne's diversion of Austrasian military energies from the frontiers of Western Christendom to the interior was fatal to Austrasia herself without proving equally fatal to the society of which Austrasia was a part. The expansion of the Western Christendom at the expense of the continental European barbarians was eventually taken up and carried on, from the line at which Charlemagne had come to a halt, by the descendants of Charlemagne's Saxon victims, and her expansion at the expense of the Syriac World in the Iberian Peninsula by a number of local Western Christian principalities, several of which were direct 'successor-states' of the Carolingian Empire. On both these fronts

¹ See I. C (i) (b), Annex I, vol. i, p. 369, above.

496 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
the price that the Western Christendom had to pay for Charlemagne's militarism was a pause which lasted for rather less than two centuries, and which was then followed by three centuries (*circa* A.D. 975-1275) of further advance.¹ On the other hand Timur's militarism deprived the Iranic Society for ever of its Promised Land in Eurasia.

The Iranic Society's forfeiture of the heritage of the Nomad World declared itself first on the plane of religion. Throughout the four centuries ending in Timur's generation Islam had been progressively establishing its hold over the sedentary peoples round the coasts of the Eurasian Steppe and had been captivating the Nomads themselves whenever they trespassed out of the Desert on to the Sown. In the tenth century of the Christian Era, when the military and political power of the Muslim sovereigns of the 'Abbasid Caliphate was in dissolution, their religion was conquering the sedentary Turkish peoples on the Middle Volga² and in the oases of the Tarim Basin and the Nomad Turkish followers of the Saljūq and the Illek Khans on the Transoxanian fringe of the Steppe between the Sea of Aral and Lake Balkash. Even in the last and greatest eruption of the post-'Abbasid *Völkerwanderung*, when the Steppe was convulsed to its depths and discharged upon Dār-al-Islām a horde of Nomads who had never been touched by the radiation of the Islamic culture and who were prejudiced against Islam, when they encountered it, by their tincture of Nestorian Christianity,³ the injury which Islam sustained from the spasmodic persecution to which it was subjected by the early Mongol Khāqāns was more than counterbalanced by the unintentional service which it received from the Mongols' policy of deliberately intermixing the peoples and cultures of their vast and heterogeneous empire. It was thanks to these pagan Nomad war-lords that Islam was propagated into China—and this not only into the north-western provinces adjoining the older Islamic domain in the Tarim Basin, but also into the new province of Yunnan in the far south-west, which was carved out of a barbarian no-man's-land and added to China by Mongol arms. Thereafter, when at the turn of the thirteenth and fourteenth centuries of the Christian Era the three western appanages of the Mongol Empire—the house of Hulāgū in Iran and the house of Jūjī on the Qipchāq Steppe and the house of Chaghatāy in Transoxania and Zungaria—were converted to Islam one after another, it looked as though nothing could now prevent Islam from becoming the religion of all Eurasia; and by the

¹ See I. B (iv), vol. i, p. 38, and II. D (v), vol. ii, pp. 167-9 and 204, above.

² The White Bulgars, who were presumably the ancestors of the present Tatars of Qazān.

³ See II. D (vii), Annex VIII, in vol. ii, especially pp. 449-52, above.

time when Timur arose as the champion of the Sunnah in Transoxania, a Muslim 'Diaspora' which had seeded itself round the western and southern coasts of the Steppe had prepared the ground—as we have noticed already¹—for him to reap the harvest of a Pan-Eurasian Islamic empire. It is the more significant that the propagation of Islam in Eurasia, which had made such headway down to Timur's time, came to a dead halt thereafter. The only subsequent gain that Islam made in this quarter was the conversion of the Turkish Khanate of Western Siberia at some date shortly before the Cossack conquest in A.D. 1582;² and this success in one remote and backward corner was little for Islam to boast of in a generation which saw another of the 'higher religions' captivate all the rest of the Eurasian Nomads who had hitherto remained in their primitive paganism.

The outstanding religious event in Eurasia at the turn of the sixteenth and seventeenth centuries of the Christian Era was the conversion of the Mongols (in A.D. 1576-7) and their westerly kinsmen the Calmucks (*circa* A.D. 1620) to the Lamaistic form of Mahayanian Buddhism;³ and this astonishing triumph of a fossilized relic of the religious life of the long extinct Indic culture gives some measure of the extent to which the prestige of Islam had fallen in the estimation of the Eurasian Nomads during the two centuries that had elapsed since Timur's day.⁴

On the political plane the Iranic culture which Timur had first championed and then betrayed proved equally bankrupt. The sedentary societies which did, in the end, perform the feat of taming the Eurasian Nomadism politically were the Russian branch of the Orthodox Christian Society and the Chinese branch of the Far Eastern; and the sentence of servitude which Fate had pronounced upon the Nomads when Timur made his winter-passage across the Steppe and overthrew Toqatmysh at Urtapa in A.D. 1391 was never executed by Transoxanian hands. It was confirmed when, in the middle of the seventeenth century, the Cossack servants of

¹ See p. 496, above.

² This, and not 1586 (the date given in II. D (v), vol. ii, p. 157, above), appears to be the true date of Yermak's crossing of the watershed between the Volga and the Ob.

³ See Part III. A, Annex II, vol. iii, p. 451, above (following Courant, M.: *L'Asie Centrale aux XVII^e et XVIII^e Siècles: Empire Kalmouk ou Empire Mantchou?* (Lyon 1912, Rey), pp. 12-14 and 17), and V. C (i) (c) 2, vol. v, p. 137, and V. C (i) (c) 3, vol. v, pp. 309-10, below.

⁴ For the Lamaistic form of the Mahāyāna as a fossil of the Indic culture see I. B (iii), vol. i, p. 35, and I. C (i) (b), vol. i, pp. 90-2, above. For the role of Tibet as the fastness in which this fossil has survived, see II. D (vi), Annex, vol. ii, p. 405, footnote 1, above. The radiation of a religious influence from Tibet over the eastern half of the Eurasian Steppe in the sixteenth and seventeenth centuries of the Christian Era will appear the more extraordinary when we consider that at this date the pagan Mongol and Calmuck Nomads were insulated from Lhasa geographically by a continuous belt of Muslim population which extended from west to east, through the oases of the Tarim Basin, into the Chinese provinces of Kansu and Shensi.

Muscovy and the Manchu masters of China ran into each other as they were feeling their way in opposite directions round the northern edge of the Steppe, and fought their first battle for dominion over Eurasia in the neighbourhood of Chingis Khan's ancestral pastures in the upper basin of the Amur.¹ The partition of Eurasia and the subjugation of its ancient Nomad occupants by the same pair of competitors was completed a century later when the Emperor Ch'ien Lung (*imperabat* A.D. 1735-96) broke the power of the Zungar Calmucks in A.D. 1755 and gave asylum to the already broken Torgut Calmuck refugees from the dominions of the Tsar in A.D. 1771.² Therewith the latest tidal wave of the Eurasian Nomadism was spent;³ and when the Muscovite and the Manchu Power had divided the allegiance of the Qāzāqs⁴—the flotsam and jetsam of the latest wave but one, who were now drifting sluggishly over the eastern portion of the Qipchāq Steppe, between the Irtish and the Yaik—the whole of Eurasia, up to the northern outskirts of the Transoxanian oases, found itself under either Russian or Chinese control.

Nor did the injury inflicted by Timur's militarism upon the Iranic World, including the conqueror's own Transoxanian homeland, stop short at the loss of a potential field for expansion across and around the Eurasian Steppe. The conclusive condemnation of the destructive militarism which possessed Timur during the last twenty-four years of his career is to be found in the fact that, besides being barren in itself, it actually led in the fullness of Time—as its consequences worked themselves out in the third and fourth generation—to the undoing of the constructive work to which Timur had devoted himself for nineteen years before he ran amok in A.D. 1381. The liberator of the nascent Iranic Society in Transoxania spent the rest of his life in so recklessly wearing out the energies which he had first mobilized against a Nomad intruder that the world which he had made safe against the hordes of Chaghatāy and Jūji found itself exposed, within little more than a hundred years after the death of the liberator-turned-militarist, to a recurrence of the Nomad peril in the shape of the Uzbegs;⁵ and in this emergency the epigoni of Timur's house were impotent—heirs, as they were, to the debilitating social legacy of Timur's mili-

¹ See Part III. A, vol. iii, p. 19, above, and V. C (i) (c) 3, vol. v, pp. 315-6, below.

² For this backward ebb, into the heart of the Steppe, of a Calmuck tide which had poured out of it in all directions a century and a half before, see the reference to De Quincey in Part III. A, vol. iii, p. 19, footnote 3, above, and V. C (i) (c) 3, vol. v, p. 315, below.

³ For a discussion of Nomad eruptions in general, and of the Calmuck eruption in particular, see Part III. A, Annex II, in vol. iii, above.

⁴ Incorrectly spelt 'Kazaks' in vol. iii, pp. 18-19, 418, 422, 423 and 521, above. For the etymology of the Turkish word see V. C (i) (c) 3, vol. v, p. 282, footnote 1, below.

⁵ On this point see Part III. A, Annex II, vol. iii, p. 447, above.

tary excesses—to repeat their ancestor's original feat. The Uzbek 'drive' at the heart of the Iranic World was eventually arrested, not by any Timurid prince of Farghānā or Khurāsān, but by the new Safawī Power of Shah Ismā'il; and even Shah Ismā'il's arms, which did effectively bar the Uzbeks' farther progress, were unable to drive the intruders right back into the Eurasian no-man's-land out of which they had issued. With his relatively distant base of operations in Azerbaijan and with his grandiose ambitions on the west—ambitions which involved him in an unequal contest with the 'Osmanlis—his power to play the liberator on the eastern front was limited; and after expelling the Uzbeks once for all from Khurāsān he was compelled in the end to leave them in permanent possession of Transoxania.¹

Thus, a century and a half after the year in which Timur had girded himself to liberate his country from the dominion of the Chaghatāy horde, Transoxania fell under the yoke of another swarm of Nomads, from the back-of-beyond, who were even more barbarous than the hateful and contemptible 'Jātah'; and under this yoke the former Eurasian march of the Iranic World, which had once spread her terror as puissantly as Assyria, was destined to lie prostrate and passive for the next three hundred and fifty years, until, in the third quarter of the nineteenth century of the Christian Era, the long-ground-down peasantry of the Transoxanian oases obtained at last the alleviation of exchanging an Uzbek for a Russian master.

It is a curious reflection that, if Timur had not turned his back on Eurasia and his arms against Iran in A.D. 1381, the present relations between Transoxania and Russia might have been the inverse of what they actually are. In those hypothetical circumstances Russia to-day might have found herself included in an empire of much the same extent as the area of the Soviet Union but with quite a different centre of gravity—an Iranic Empire in which Samarqand would be ruling Moscow instead of Moscow ruling Samarqand. This imaginary picture of an alternative course of Iranic history may appear outlandish because the actual course has been taking an altogether different direction for the last four hundred years and more. At least as strange a picture will unfold itself before our mind's eye if we plot out an alternative course of Western history in which the consequences of Charlemagne's militarism for our world are imagined to have been as utterly disastrous as those of Timur's militarism actually were for his. On this analogy we shall have to picture Austrasia being submerged

¹ For these transactions in South-Western Asia in the early years of the sixteenth century of the Christian Era see I. C (i) (b), Annex I, in vol. i, above.

500 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
by the Magyars and Neustria by the Vikings in the tenth century, and the heart of the Carolingian Empire remaining thereafter under this barbarian domination until in the fourteenth century the 'Osmanlis step in to impose the lesser evil of an alien civilization upon these derelict marches of Western Christendom.

Thus, besides forfeiting a Promised Land, Timur undid his own work of liberating his native country; but the greatest of all his acts of destruction was committed against himself. He has succeeded in making his name immortal at the price of erasing from the minds of Posterity all memory of the deeds for which he might have been remembered for good. To how many people in either Christendom or Dār-al-Islām to-day does Timur's name call up the image of a champion of Civilization against Barbarism, who led the clergy and people of his country to a hard-won victory at the end of a nineteen-years-long struggle for independence? To the vast majority of those to whom the name of Timur Lenk or Tamerlane means anything at all, it commemorates a militarist who perpetrated as many horrors in the span of twenty-four years as had been perpetrated in a century by a succession of Assyrian kings from Tiglath-Pileser III to Assurbanipal inclusive. We think of the monster who razed Isfarā'in to the ground in 1381; built two thousand prisoners into a living mound, and then bricked them over, at Sabzawār in 1383; piled 5,000 human heads into minarets at Zirih in the same year; cast his Lūrī prisoners alive over precipices in 1386; massacred 70,000 people, and piled the heads of the slain into minarets, at Isfahān in 1387; massacred the garrison of Takrit, and piled their heads into minarets, in 1393; massacred 100,000 prisoners at Delhi in 1398; buried alive the 4,000 Christian soldiers of the garrison of Sivas after their capitulation in 1400; built twenty towers of skulls in Syria in 1400 and 1401; and dealt with Baghdad in 1401 as he had dealt fourteen years earlier with Isfahān. In minds which know him only through such deeds, Timur has caused himself to be confounded with the ogres of the Steppe—a Chingis and an Attila and the like—against whom he had spent the better half of his life in waging a Holy War. The crack-brained megalomania of the homicidal madman whose one idea is to impress the imagination of Mankind with a sense of his military power by a hideous abuse of it is brilliantly conveyed in the hyperboles which the English poet Marlowe has placed in the mouth of his Tamburlaine:

I hold the Fates bound fast in yron chaines,
And with my hand turne Fortune's wheel about,
And sooner shall the Sun fall from his Spheare,
Than Tamburlaine be slaine or overcome. . . .

The God of war resignes his rounge to me,
 Meaning to make me Generall of the world;
 Jove, viewing me in armes, lookes pale and wan,
 Fearing my power should pull him from his throne.
 Where ere I come the fatall sisters sweat,
 And griesly death by running to and fro,
 To doo their ceassles homag to my sword. . . .
 Millions of soules sit on the bankes of Styx,
 Waiting the back returne of Charon's boat,
 Hell and Elysian swarme with ghosts of men,
 That I have sent from sundry foughthen fields,
 To spread my fame through hell and up to heaven. . . .
 Nor am I made Arch-monark of the world,
 Crown'd and invested by the hand of Jove,
 For deeds of bounty or nobility;
 But since I exercise a greater name,
 The Scourge of God and terrour of the world,
 I must apply my selfe to fit those tearmes,
 In war, in blood, in death, in crueltie. . . .
 I will persist a terrour to the world,
 Making the Meteors, that like armed men
 Are seene to march upon the towers of heaven,
 Run tilting round about the firmament,
 And breake their burning Lances in the aire,
 For honor of my woondrous victories.¹

The Margrave turned Moss-trooper.

In analysing the careers of Timur and Charlemagne and the kings of Assyria from Tiglath-Pileser III to Assurbanipal, we have observed the same phenomenon in all three cases. The military prowess which a society develops among its frontiersmen for its defence against external enemies undergoes a sinister transformation into the moral malady of Militarism when it is diverted from its proper field in the no-man's-land beyond the pale and is turned against the frontiersmen's own brethren in the interior of a world which it is their mission to protect and not to devastate. A number of other examples of this destructive social evil will readily occur to our minds.

We shall think of Mercia turning against the other English 'successor-states' of the Roman Empire in Britain the arms which she had sharpened in the performance of her original function as the English march against Wales;² of the Plantagenet Kingdom of England attempting in the Hundred Years' War to conquer the sister Kingdom of France instead of attending to her proper business

¹ Marlowe, Christopher: *Tamburlaine the Great*, ll. 369-72; 2232-8; 2245-9; 3824-30; 3875-80.

² See II. D (v), vol. ii, pp. 195-6, above.

502 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS

of enlarging the bounds of their common mother, Latin Christendom, at the expense of 'the Celtic Fringe'; and of the Norman King Roger of Sicily turning his military energies to the extension of his dominions in Central Italy—at the expense of the South Lombard duchies and the Holy Roman Empire and the States of the Church—instead of devoting himself to carrying on his forebears' work of enlarging the bounds of Western Christendom in the Mediterranean at the expense of Orthodox Christendom and Dār-al-Islām. In the Mexic World we see the Aztecs warring down the Toltecs, to whom they owed their own initiation into the Mexic culture, instead of confining themselves to their proper task of guarding the northern march against the unconverted Chichimecs of the wilderness; in the Andean World we see the Incas bending their energies to the subjugation of their lowland neighbours in the coastlands and their highland neighbours in Ecuador, who were co-heirs with them in the heritage of the Andean Civilization, while they made little headway against the dangerous savages of Amazonia or the valiant barbarians of Southern Chile and the Pampas, whom it was their mission to keep at bay.¹ In like fashion the Mycenaean outposts of the Minoan Civilization on the European mainland misused the prowess which they had acquired in holding their own against the continental barbarians, in order to turn and rend their mother Crete;² and the Macedonians and the Romans, whose function in the Hellenic World was to serve as wardens of the marches against the same barbarians, committed in their turn the same crime as the Mycenaeans when they contended with their neighbours, and finally with each other, for the illegitimate prize of a Pan-Hellenic hegemony.³ In the Sinic World the part of Rome was played by Ts'in, the western march against the barbarian highlanders of Shensi and Shansi and against the Nomads of the Eurasian Steppe, when her princes stepped into an arena which had formed itself in the interior and there eventually delivered the 'knock-out blow' in the struggle between the contending states.⁴

In the Egyptiac World the classic Southern March in the section of the Nile Valley immediately below the First Cataract trained itself in arms, in the execution of its duty of damming back the Nubian barbarians up-river, only to turn right-about, direct its arms down-river against the Egyptiac communities in the interior, and take advantage of its military superiority in order to establish by brute force the United Kingdom of the Two Crowns.⁵ This act

³ See II. D (v), vol. ii, pp. 160-4, above.

⁴ See I. C (i) (b), vol. i, p. 89, and III. C (i) (b), vol. iii, p. 167, above, and V. C (ii) (b), vol. vi, pp. 291-5, below.

⁵ See II. D (v), vol. ii, pp. 112 and 114-15, above.

of Militarism, which was at once the making and the marring of the Egyptiac Civilization, has been depicted by its perpetrator, with all the frankness of self-complacency, in one of the earliest of the Egyptiac records that have come into the hands of our modern Western archaeologists. The palette of Narmer portrays the triumphant return of the Upper Egyptian war-lord from the conquest of Lower Egypt. Swollen to a superhuman stature, the royal conqueror marches behind a strutting file of standard-bearers towards a double row of decapitated enemy corpses, while below, in the image of a bull, he tramples upon a fallen adversary and batters down the walls of a fortified town. The accompanying script is believed to enumerate a booty of 120,000 human captives, 400,000 oxen, and 1,422,000 sheep and goats.¹

In this gruesome work of an archaic Egyptiac art we have the whole tragedy of Militarism as it has been acted over and over again since Narmer's time by the Sennacheribs and Tamerlanes and Charlemagnes of twenty different civilizations down to our own militarists in the Western World of to-day. Perhaps the most poignant of all the performances of this tragedy during its run of some six thousand years up to date is that of which Athens was guilty when she transformed herself from a 'liberator of Hellas'² into a 'tyrant city'³ by misusing for the oppression of her Hellenic allies and protégées the naval power with which she had armed herself so short a time before in order to save herself—and rescue all Hellas in the act—from the aggression of the Achaemenidae. This Athenian aberration brought upon the whole of Hellas, as well as upon Athens herself, the never-retrieved disaster of 431–404 B.C. And, if an Athens under arms succumbed to so gross a sin, with such fatal consequences, can any of those military and naval Powers of our modern Western World who surpass Athens in arms as signally as they fall short of her in the arts, feel sure of preserving their own moral integrity?

In all the examples of which we have just been reminding ourselves in a cursory review, the suicidalness of Militarism is as evident as it is in the three classic cases with which we have dealt

¹ A photograph of the palette will be found in Rostovtzeff, M.: *A History of the Ancient World* (Oxford 1926, University Press, 2 vols.), vol. i, Plate IV, opposite p. 30; and in *The Cambridge Ancient History*, Plates, vol. i (Cambridge 1927, University Press), plate facing p. 78, fig. [c]. For the statistics of the spoil see Dawson, C.: *The Age of the Gods* (reissue: London 1933, Sheed and Ward), p. 153.

² See the judgement which Herodotus goes out of his way to record in Book VII, chap. 139. The conviction with which this sceptical-minded observer expresses his opinion on the point is made all the more striking by the apologetic tone in which he delivers himself—writing, as he was, at a time when any praise of Athens had been made invidious by the odious misbehaviour of Athens herself.

³ The description of the Athenian Empire which is placed in the mouth of the Athenian politician Cleon by the historian Thucydides (Book III, chap. 37) in his version of a public speech which was delivered by Cleon in 427 B.C.

at greater length; and it comes out most strikingly of all where the fatal change of front has not been exclusively devastating in its effects, but has also been incidentally constructive. The diversion of Athenian and Macedonian arms from the external frontier towards the interior of the Hellenic World was disastrous for Hellas even though the Athenian and Macedonian militarists were doing something to provide the Hellenic Society with the political world order of which it then stood in need.¹ The corresponding changes of front which were made by Rome and Ts'in and the Incas were likewise disastrous to their respective societies in spite of the fact that in each of these cases the militarist community did succeed, through the triumph of its militarism, in providing its society with a universal state. And Narmer's change of front from up-stream to down-stream in the Nile Valley had a sinister effect upon the subsequent course of Egyptiac history even though it resulted in the establishment of the United Kingdom. In the palette of Narmer we have the first evidence of that brutal vein in the Egyptiac *êthos* which so soon arrested the growth of the Egyptiac Civilization. The descendants of the Lower Egyptian peasants whom Narmer had slaughtered or enslaved were those unfortunate human beings who were converted into 'man-power' by the Pyramid-Builders.²

The military field which we have been surveying in this chapter is illuminating for the study of the fatal chain of *κόρος-ὑβρις-ἄτη* because military skill and prowess are edged tools which are apt to inflict fatal injuries upon those who venture to wield them if there is even the slightest clumsiness or misjudgement in their use. When an individual or a government or a community that has command of military power mistakes the limits of the field within which this power can be used with effect, or misconceives the nature of the objectives which it is possible to attain by means of it, the disastrousness of this aberration can hardly fail to make itself conspicuous through the seriousness of the practical consequences. But what is palpably true of military action is also true of other human activities in less hazardous fields where the train of gunpowder that leads from *κόρος* through *ὑβρις* to *ἄτη* is not so explosive. Whatever the human faculty, or the sphere of its exercise, may be, the presumption that because a faculty has proved equal to the accomplishment of a limited task within its proper field it may therefore be counted upon to produce some inordinate effect in a different set of circumstances is never anything but an intellectual and a moral aberration and never leads to anything but certain disaster.

(β) *The Intoxication of Victory.*

The Roman Republic.

One of the more general forms in which the tragedy of κόπος-ὑβρις-ἄρη presents itself is the intoxication of victory—whether the struggle in which the fatal prize is won be a war of arms or a conflict of spiritual forces. Both variants of this drama may be illustrated from the history of Rome: the intoxication of a military victory from the breakdown of the Republic in the second century B.C., the intoxication of a spiritual victory from the breakdown of the Papacy in the thirteenth century of the Christian Era.

The demoralization to which the governing class in the Roman Republic succumbed at the close of half a century of titanic warfare (220–168 B.C.) which had begun with the terrible ordeal of the Hannibalic War and had ended in the conquest of the World, is caustically described by a contemporary Greek observer who happened to be one of the victims.

‘The first result of the friendship between Polybius and Scipio Aemilianus¹ was a dynamic enthusiasm for higher things which took possession of them both and which inspired them with the ambition to win moral distinction and to compete victoriously in this field with their contemporaries. The great prize on which they had thus set their hearts would have been difficult to attain in ordinary circumstances; but unhappily in the Rome of that generation the standard of the competition was lowered by the general demoralization of Society. Some were “all out” for women, others for unnatural vice, and many for “shows” and drink and all the extravagance for which “shows” and drink gave occasion. These were all vices for which the Greeks had a weakness, and the Romans had caught this infirmity from them instantaneously during the third Romano-Macedonian War. So violent and so uncontrolled was the passion for these vices that had overcome the younger generation of Romans that it was quite a common thing to buy a boy-favourite for a talent and a jar of caviare for three hundred drachmae—behaviour which drew from Marcus Cato in a public speech the indignant exclamation that the demoralization of Roman Society was glaringly exposed in the mere fact of handsome boys fetching a higher price than land, and jars of caviare than live-stock. If it is asked why this social malady “lighted up” at this particular time, two reasons can be given in answer. The first reason was that, with the overthrow of the Kingdom of Macedon, the Romans felt that there was no Power now left in the World that could challenge their own supremacy.² The second reason was that the

¹ This friendship started at the time when Polybius was a political deportee, interned in Italy, after the victory of Rome in the third Romano-Macedonian War (*gerebatur* 172–168 B.C.). For the circumstances see III. C (ii) (b), in vol. iii, p. 315, above.—A.J.T.

² The demoralizing release of Roman souls from the salutary fear of a formidable

506 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
material display, both private and public, of life in Rome had been enormously enhanced by the removal to Rome of properties (*χορηγιών*) from Macedonia.¹

This was the moral pass to which the Roman governing class had been brought by the overwhelming victory which had descended upon the Republic after years of agony in which she had been tottering on the verge of an abyss. The first reaction of a generation which had lived through this bewildering experience was a blind presumption that a victor's irresistible material power was the key to a solution of all human problems, and that the only conceivable end of Man was an unbridled enjoyment of the grossest pleasures which this power could place within his grasp.² The victors did not realize that this very state of mind bore witness to the moral defeat which a militarily vanquished Hannibal had succeeded in inflicting upon them.³ They did not perceive that the world in which they passed for victors was a world in ruins, and that their own ostensibly victorious Roman Republic was the most sorely stricken⁴ of all the prostrate states of which this ruined world was made up. In this moral aberration they wandered in the wilderness for more than a hundred years; and in this awful century they inflicted one calamity after another upon a world which their victory had placed at their mercy, and the greatest calamities of all upon themselves.

Even in the military coin which was their own chosen currency their bankruptcy soon became manifest. The hard-won Roman triumphs over a Hannibal and a Perseus were followed by a series of humiliating Roman reverses at the hands of antagonists who were utterly outmatched by Rome in military strength: the broken, disarmed, and almost defenceless Carthage upon whom the Roman

foreign foe is traced by Saint Augustine (*De Civitate Dei*, Book I, chap. 30) to the overthrow, not of Macedon in the Third Romano-Macedonian War, but of Carthage in the Third Romano-Punic War. 'Deleta quippe Carthagine, magno scilicet terrore Romanae rei publicae depulso et extincto, tanta de rebus prosperis orta mala continuo subsequuta sunt ut . . .'.—A.J.T.

¹ Polybius: *An Oecumenical History*, Book XXXI, chap. 25. The effect that Polybius here ascribes to Paullus's victory in Greece in 168 B.C. is ascribed to Sulla's campaigns in Asia in the second decade of the last century B.C. by Sallust: 'Ibi primum insuevit exercitus Populi Romani amare potare, signa tabulas pictas vasa caelata mirari, ea privatim et publice rapere, delubra spoliare, sacra profanaque omnia polluere' (*Bellum Catilinae*, chap. 11).

² 'Qui labores, pericula, dubias asperasque res facile toleraverant, eis otium divitiae, optanda alias, oneri miseriaeque fuere. igitur primo imperi, pecuniae deinde cupido crevit; ea quasi materies omnium malorum fuere.'—Sallust, op. cit., chap. 10.

³ 'Quippe secundae res sapientium animos fatigant: ne illi corruptis moribus victoriae temperarent.'—Sallust, op. cit., chap. 11. 'Tunc iam Roma subiugaverat Africam, subiugaverat Graeciam, lateque etiam aliis partibus orbis imperans tanquam se ipsa non valens ferre sua se quodammodo magnitudine fregerat' (Augustine: *De Civitate Dei*, Book XVIII, chap. 45, perhaps unconsciously reproducing Horace's 'Suis et ipsa Roma viribus ruit' (Epode xvi, l. 2, quoted in V. C. (i) 3, vol. v, p. 406, below)).

⁴ 'Similior victo fuerit ille qui vicit.'—Augustine: *De Civitate Dei*, Book III, chap. 19, apropos of the outcome of the Hannibalic War.

Government passed a cold-blooded sentence of annihilation in 149 B.C.; the barbarian Numantines who defied all Roman efforts to subjugate them from 153 to 133; the enslaved and expatriated Orientals who broke out of their ergastula on the Sicilian plantations in 135 and 104;¹ the mutinous gladiators at whose head Spartacus ranged as freely over Italy from 73 to 71² as Hannibal himself had ranged from 218 to 211; the 'Citizens of the Sun' who put their faith in Aristonicus of Pergamum and held out against the power of Rome for three years (132-130) in the strength of their belief in the coming of a new dispensation;³ and the rebellious native princes—a Jugurtha⁴ and a Mithradates⁵—who repudiated their allegiance and taxed their outraged suzerain's strength to the uttermost before she succeeded in bringing them to book.

The reason why Rome thus covered herself with military dishonour on the morrow of a military triumph was because during this century her officers were leading soldiers who had no longer anything to gain by victory against an enemy who, on his side, had no longer anything to hope for from laying down his arms.⁶ Both the mobilization of the Italian peasantry and the subjugation of the barbarians and the Orientals were now being exploited heartlessly for the pecuniary profit of the Roman governing class. The provinces were being drained of their inanimate wealth and their human inhabitants in order to provide lucrative contracts for Roman business men and cheap man-power for Roman senators' cattle-ranches and plantations; and the land which was being stocked with this alien slave-labour in order to multiply the fortunes of a small class of already rich men was Italian land which was being placed at the disposition of these capitalists by the impoverishment and eviction of the former peasant proprietors. The nucleus of the latifundia which 'ruined Italy'⁷ was the devastated area in the South which became public property as a result of the Hannibalic War, partly in punishment for the defection of the original owners to the invader's camp, and partly because the original owners had simply disappeared. Thereafter the new class of post-war 'planters' and 'ranchers' was able to add field to field by buying up the freeholds which were thrown upon the market when their owners were mobilized and kept under arms for years

508 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
on end in some distant theatre of chronic frontier-warfare—on the western borders of the two provinces in Spain, or on the northern borders of the province of Macedonia.¹

In this age the subjects and the citizens of the Roman Republic were fellow victims of a *ci-devant* Roman governing class which had been transmuted by the intoxication of victory into a band of robbers.² In 104 B.C., when the whole Hellenic World was overshadowed by the common menace of a barbarian avalanche from Northern Europe, the King of Bithynia, which was officially a friendly state under Rome's protectorate, could reply with biting irony, when the highest representative of the Roman Government served him with a requisition for a contingent of troops, 'that most of his subjects had been kidnapped by the [Roman] tax-farmers and were now living in slavery in territories under Roman administration'.³ And in 133 B.C. a high-minded young Roman aristocrat who attempted to carry out a social reform, and thereby precipitated a revolution,⁴ could declare without contradiction:

'The wild animals that range over Italy have a hole, and each of them has its lair and nest, but the men who fight and die for Italy have no part or lot in anything but the air and the sunlight. . . . It is for the sake of other men's wealth and luxury that these go to the wars and give their lives. They are called the lords of the World, and they have not a single clod of earth to call their own.'⁵

The militant refusal of Tiberius Gracchus's peers to support him in seeking a remedy for the Roman peasantry's wrongs evoked a revolution which festered into a civil war; and the self-destructive violence which was let loose within the bosom of the Roman Commonwealth by the murder of the would-be reformer in 133 B.C. was brought under control again only by the establishment of the *Pax Augusta* in 31 B.C. after the Battle of Actium.

To a Roman poet, reviewing the tragedy in retrospect, it seemed evident that in this century of self-inflicted agony the Roman people were being punished for their sins.

¹ For the spread of the slave-plantation system in Southern Italy after the Hannibalic War see III. C (i) (b), vol. iii, pp. 170-1, above.

² 'Ex divitiis iuventutem luxuria atque avaritia cum superbia invasere: rapere consumere, sua parvi pendere aliena cupere, pudorem pudicitiam, divina atque humana promiscua, nihil pensi neque moderati habere.'—Sallust, *op. cit.*, chap. 12. 'Ut Romani illi qui vita integritate mala metuebant ab hostibus, perdita integritate vitae crudeliora paterentur a civibus; eaque ipsa libido dominandi, quae inter alia vitia generis humani meracior inerat universo populo Romano, posteaquam in paucis potentioribus vicit, obtritros fatigatosque ceteros etiam iugo servitutis oppressit.'—Augustine: *De Civitate Dei*, Book I, chap. 30.

³ Diodorus of Agyrium: *A Library of Universal History*, Book XXXVI, chap. 3.

⁵ Tiberius Gracchus, quoted by Plutarch: *Lives of the Gracchi*, chap. 9. See further, V. C (i) (c) 2, vol. v, pp. 70-1; V. C (i) (c) 1, Annex, vol. v, pp. 573-4; and V. C (ii) (a), Annex II, vol. vi, p. 381, with Table VIII, logion (α), p. 414, below.

Ergo inter sese paribus concurrere telis
 Romanas acies iterum videre Philippi,
 nec fuit indignum superis bis sanguine nostro
 Emathiam et latos Haemi pinguescere campos.¹

And even then, when the blood-price had been paid twice over, Virgil was tormented by a fear that Augustus himself might not be granted grace to lift the curse.

Di patrii, Indigetes, et Romule, Vestaque mater
 quae Tuscum Tiberim et Romana palatia servas,
 hunc saltem everso iuvenem succurrere saeclo
 ne prohibete. satis iam pridem sanguine nostro
 Laomedontae luimus periuria Troiae.²

On this note of prayer³ the poem ends, without presuming to anticipate the answer; and in ending thus the poet's intuition was right; for the *Pax Augusta*, as we have seen,⁴ inaugurated no 'Golden Age', but only an 'Indian Summer'.⁵ By the time when Virgil wrote those lines the injury which Roman ὕβρις had already inflicted upon Rome herself, and upon the whole of the Hellenic Society, was quite past repair. The most that the gods of the dominant minority were able to grant to the last of their favourites was a respite which was not a reprieve; and even this respite was to redound to the benefit, not of the bankrupt gods' own people, but of a *nova progenies*:⁶ a 'coming race' whose eyes were set upon a distant horizon and whose faith was founded on the power of a different saviour.⁷ The irreparable event which had occurred in the Hellenic World between the generation of Polybius and the generation of Virgil was the Secession of the Proletariat;⁸ and the inexorable event which was to follow between the generation of Virgil and that of Marcus Aurelius was the budding, within the bosom of this Proletariat, of the germ of a new social order.

The material grievance which Gracchus had sought to remedy by political action was eventually redressed in a perversely anti-social way when the descendants of such Italian peasants as had succeeded in still clinging to the land were ruthlessly evicted by a succession of revolutionary war-lords, from Sulla to Augustus himself, in order to provide allotments for the descendants of their

510 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
uprooted brothers who had long since become incapable of effectively 'going back to the land' after having been forced for years on end to make the camp their home and the sword their means of livelihood.

Impius haec tam culta novalia miles habebit,
barbarus has segetes.¹

This travesty of the Gracchan remedy was even worse than the disease of an uprooted and militarized citizen-proletariat. It dealt the final blow to Italian agriculture.² But, at a moment when the social problems of Italy were utterly defeating all the manœuvres of Roman statesmanship, the parable of the wild things' 'holes' and 'nests', which Tiberius Gracchus had once employed in a political speech as a figurative search-light to show up a social wrong, was being applied to illustrate a different and a deeper truth by a prophet in Syria³ who made no impression on the minds of the Roman authorities of the day (not even when, in the course of their administrative routine, they had occasion to put him to death). When Jesus took upon himself the sufferings of a Galilaean peasantry who had been despoiled by the same predatory hand as the peasants of the Ager Mantuanus, and when he said to the scribe 'the foxes have holes and the birds of the air have nests but the Son of Man hath not where to lay his head',⁴ he was using the Gracchan image in order to make the Proletariat understand that the wrongful and violent spoliation of their material goods was not a ground for revolutionary reprisals, or even perhaps for political reforms, but was actually a blessing in disguise because it was an unsuspected source of spiritual wealth.

'Blessed are the meek, for they shall inherit the Earth. . . .

'Blessed are they which are persecuted for righteousness' sake, for theirs is the Kingdom of Heaven.'⁵

In a lesser degree this intoxication of victory, which carried the Roman governing class to perdition after their conquest of the Hellenic World in the half-century ending in the Battle of Pydna, was likewise the ruin of the Spaniards and the Portuguese after their conquest of the New World at the beginning of the Modern Age of our Western history, and again the ruin of the British after their conquest of Bengal and Canada in the Seven Years' War.

¹ Virgil, *Eclough* i, ll. 70-1.

³ For the attribution of the same saying both to Tiberius Gracchus and to Jesus see V. C (ii) (a), Annex II, vol. vi, p. 381, with Table VIII, logion (α), p. 414, below.

⁴ Matt. viii. 20 = Luke ix. 57-8 = 'Q'. For the literary relation between the Christian and the pagan version of this λόγιον see V. C (ii) (a), Annex II, Table VIII, vol. vi, p. 414, below.

⁵ Matt. v. 5 and 10.

The Spaniards and Portuguese, who in A.D. 1493 had obtained from the Pope an arbitral award,¹ partitioning between them the whole of the Overseas World as though no other claimants were in the field, saw their monopoly broken within less than a century when the Dutch and the English and the French made free with the Spanish preserves in America and the Portuguese preserves in Africa and India, and both the Iberian Powers' preserves in the Far East, after the defeat of the Spanish Armada. And the intoxication of the Iberian pioneers with their original achievement—their overweening pride in the knowledge that

We were the first that ever burst
into that silent sea²—

was the gaping joint in their armour through which their lynx-eyed and nimble-handed European competitors directed their disabling thrusts at the turn of the sixteenth and seventeenth centuries.

As for the English, they were temporarily shaken out of the moderation which they have studiously practised both before and since by the extraordinary lavishness of Fortune when she showered Canada upon them with one hand and Bengal, simultaneously, with the other. In 1763 it seemed 'the manifest destiny' of the British Empire to swallow up the whole of North America as well as the whole of India. Yet twenty years later Great Britain had lost the better half of one of the two sub-continent and was in imminent danger of losing the whole of the other. It is true that the verdict of History has now acquitted British statesmanship of exclusive responsibility for the break-up of the First British Empire. American historians have latterly done much to show that in the fratricidal war of 1775-83 the war-guilt was divided; and the name of Warren Hastings no longer sounds so sinister as it was made to sound a century and a half ago. Nevertheless the fact remains that the Thirteen Colonies would never have been lost to the British Crown if from 1763 to 1775 it had shown towards them the same tact and consideration as it has repeatedly shown towards Canada from 1774 onwards. Nor would Bengal have been retained—nor, *a fortiori*, enlarged into an empire embracing all India—if the predatory practices of the Company's servants in the East, from Clive and Warren Hastings downwards, during the twenty-six years following the intoxicating victory of Plassey had not been discouraged by the abortive India Bill of 1783 and the effective India Bill of 1784 and the long-drawn-out state trial of 1786-95.

¹ Embodied in Pope Alexander VI's three successive bulls of the 3rd May, the 4th May, and the 25th September, 1493, which were taken as the basis for the Spanish-Portuguese Agreement of the 7th June, 1494.

² Coleridge, S. T.: *The Ancient Mariner*.

However sincerely Clive may have 'marvelled at' his 'own moderation', his economy of virtue would assuredly soon have cost his countrymen the loss of an Oriental dominion which his excess of unscrupulousness had suddenly won for them, if they had not exerted themselves to improve upon Clive's moral standards under the sobering influence of their American disaster.

The Roman See.

Perhaps the most signal of all public examples of the disastrous consequences of the intoxication of victory is afforded by one of the chapters in the long, and still living and lengthening, history of the Papacy.

The chapter in the history of this greatest of all Western institutions which began on the 20th December, 1046, with the opening of the Synod of Sutri by the Emperor Henry III,¹ and which closed on the 20th September, 1870, with the occupation of Rome by the troops of King Victor Emmanuel, displays certain broad correspondences with a chapter of almost equal length in the history of the Roman Republic which began with the *Clades Alliensis* of the 18th July, 390 B.C., and closed with the occupation of Rome by Alaric on the 24th August, A.D. 410. In both these dramas the wheel comes round full circle. In the historical tragedy of Papal Rome the ecclesiastical head of Western Christendom was compelled twice over to capitulate in his own See to a secular sovereign, as in the tragedy of pagan Rome the city which was the warden of the continental European marches of the Hellenic World² was likewise compelled twice over to admit a barbarian trespasser within her walls. In both these chapters of history the period of more than eight hundred years which the wheel of Fortune took to revolve was occupied by an extraordinary feat and an extraordinary fall. And in both chapters Rome brought her fall upon herself.

Without elaborating our parallel too fancifully, we may notice how these two versions of the Roman tragedy resemble one another act by act.

Just as the *Clades Alliensis* evoked among the citizens of the Roman Republic the mood in which, half a century later, they contended with the Samnites for the hegemony of Italy and won the prize through their victory in a fifty years' war (343-290 B.C.),³ so the blow dealt to the Papacy by the Emperor Henry III at the Synod of Sutri reverberated in the soul of Hildebrand⁴ for thirty

¹ For the preceding chapter in the history of the Papacy, which the Synod of Sutri brought to a close, see IV. C (iii) (c) 2 (β), pp. 335-40, above.

² For this role of Rome in the life of the Hellenic Society see II. D (v), vol. ii, pp. 161-4, above.

³ See II. D (iv), vol. ii, pp. 101-2, above.

⁴ While the proceedings at the Synod of Sutri shook Hildebrand and the other

years until he threw down the gauntlet to the Emperor Henry IV and launched the Papacy on its fifty years' contest with the Empire over the question of Investiture (A.D. 1075-1122). And if the conflict between the Papacy and the Salian Dynasty is comparable to the warfare between Rome and Samnium, the more violent, bitter, and devastating conflict between the Papacy and the Hohenstaufen Dynasty is still more strikingly reminiscent of the warfare between Rome and Carthage. In either case the duel between Rome and her arch-enemy took three rounds to fight itself out; and each successive round was fought with greater savagery than its predecessor. If the struggles between Pope Alexander III and the Emperor Frederick I, and between Pope Gregory IX and the Emperor Frederick II, may be regarded as the respective analogues of the First and Second Romano-Punic wars, the spirit in which the Romans made the Third Romano-Punic War, with the deliberate purpose of annihilating in cold blood an enemy who was already prostrate, was unmistakably revived in the Catonian implacability with which an Innocent IV and an Urban IV kept up their feud with the Emperor Frederick II after their great enemy's death, and insisted upon converting it from a quarrel with a single individual into a vendetta which could not be appeased by any lesser retribution than the complete ruin and annihilation of the whole of the offender's house.

In this Hohenstaufen-Punic act of the twice-performed Roman play the resemblances even extend to details. For example, the strategy of Frederick Barbarossa after his acknowledgement, in the peace-treaties of Venice (A.D. 1177) and Constance (A.D. 1183), of his failure to reassert the Imperial authority in Lombardy may be compared with Hamilcar Barca's strategy after the cession of the old Carthaginian dominion in Sicily in the peace settlement of 241 B.C. As Hamilcar set himself to conquer for Carthage a new and more valuable empire in the Iberian Peninsula, so Frederick secured for the House of Hohenstaufen the reversion of the Kingdom of Sicily. In either case a Power which had just been foiled in one trial of strength with its Roman adversary proceeded to occupy a new coign of vantage from which it could attack Rome on a second front with fresh supplies of men and money. In either case the consequence of this masterly stroke on the part of Rome's opponent was a second trial of strength on a greater scale which

Curial champions of reform into militancy, neither Hildebrand himself nor Saint Peter Damian nor Cardinal Humbert appears to have shown any personal animus against the Emperor Henry III—who had, after all, been seeking to serve the cause of reform in his high-handed use, or abuse, of his Imperial prerogative (see the evidence presented by Carlyle, R. W. and A. J.: *A History of Mediaeval Political Theory in the West*, vol. iv (Edinburgh and London 1922, Blackwood), pp. 20-1).

514 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS ended in confirming Rome's victory, but which brought her, first, so near to defeat, and left the victor's heart so morbidly obsessed by fear and hatred of the vanquished, that Rome could not rest until she had returned to the attack and had dealt her already beaten and stricken enemy 'the knock-out blow'.

In the next act a victorious Rome collapses ignominiously under the weight of a vindictiveness which has led her to pursue her adversary's destruction to her own undoing. The century of humiliation (A.D. 1303-1418) which was the nemesis of the Papacy's relentless pursuit of its vendetta against the Hohenstaufen has its analogue in the century of suffering with which the Roman Republic had to pay for the cold-blooded destruction of Carthage.¹ The desecration of the Pope's personal sacrosanctity through the brutal handling of Boniface VIII by Guillaume Nogaret and Sciarra Colonna may be compared with the pricking of the bubble of Roman military prestige by the ignominy of Mancinus's capitulation to the Numantines. In the sequel 'the Babylonish captivity' of the Papacy may be compared with the bout of revolution into which the Republic fell in 133 B.C.,² and 'the Great Schism' with the civil war out of which the Empire emerged in 31 B.C.

In either version, again, the last act is a melancholy and tedious anti-climax in which the play drags on for some four centuries longer before the curtain descends. If we fix our attention upon the abortive rallies by which the gloom of this twilight age is partially relieved, we may discern a dim resemblance between the pontificate of Martin V and the principate of Augustus and between 'the Counter-Reformation' and 'the Indian Summer' of the Antonines.³ And as we watch the last scene of all we may detect in Pope Pius IX, who became 'the prisoner in the Vatican' as soon as the French garrison withdrew from Rome and the Italian army marched in, an historical counterpart of the Emperor Honorius, who became 'the refugee in Ravenna' when Rome was left at Alaric's mercy by the removal of Stilicho's protecting hand.

It will be apparent that our analogy with a chapter in the history of the Roman Commonwealth can give us some insight into the history of the Roman See between A.D. 1046 and A.D. 1870. Yet on a further analysis both the rise and the fall of the Papacy in this extraordinary passage of its career will be found to display features

¹ See the present chapter, pp. 505-10, above.

² One striking feature that the Papal régime during the period of 'the Babylonish Captivity' at Avignon has in common with the Republican régime in the Post-Gracchan Age is the development, on the grand scale, of an efficient but parasitic system of finance. A fiscal agent of the Papal Curia in the fourteenth century of the Christian Era and a Roman *publicanus* of the second century B.C. would have recognized one another as birds of a feather; and the affinity between them is not fortuitous; for either of these two Roman systems of finance was the Dead Sea fruit of a devastating war.

³ For this 'Indian Summer' see IV. C (ii) (b) 1, pp. 58-63, above.

which it would be difficult to illuminate by any historical parallels. In one aspect after another the Papal *Respublica Christiana* seems to defy classification and to reveal itself as something unique.

Perhaps the closest counterpart of the institution which was founded at Rome by the genius of Hildebrand in the eleventh century of the Christian Era is the régime which was inaugurated at Thebes by Hrihor, the Chief Priest of Amon-Re, in the eleventh century B.C.¹ The Rome of Hildebrand's day, like the Thebes of Hrihor's, was a holy city whose holiness was the legacy of an extinct political power.² In either city the place once filled by the emperor of a universal state was now occupied by the guardian and ministrant of the shrine of the city's tutelary divinity or saint; and this civic ecclesiastical dignity had become the acknowledged shepherd, not only of the city itself, but of an oecumenical flock whose forebears had looked to Rome or Thebes, not for religious guidance, but for political leadership. In either case, again, the

¹ See II. D (v), vol. ii, p. 116, footnote 1, and IV. C (iii) (c) 2 (β), in the present volume, p. 421, above.

² Amon of Thebes became the paramount god, and the Chief Priest of Amon-Re the principal ecclesiastical dignity, in the Egyptian World in consequence of the fact that Thebes was the capital city of the Egyptian universal state. If this universal state had not been founded by a dynasty from the Thebaid in the twenty-first century B.C. and restored by a dynasty from the Thebaid in the sixteenth century, it is certain that in the fifteenth century the Chief Priest of Amon-Re would not have been invested, as he was in the actual event, with the presidency of the Pan-Egyptian corporation into which all the priests of all the gods in all the 'nomes' were organized by the Emperor Thothmes III (for this event, see I. C (ii), vol. i, p. 145, footnote 5, and IV. C (iii) (c) 2 (β), in the present volume, p. 421, above, and V. C (i) (d) 6 (δ), vol. v, p. 530, below). On the same showing, we may be sure that Rome would never have come to be the seat of the Papacy if in an earlier chapter of her history she had not been the nucleus and the capital of the Hellenic universal state. If the role of Rome in Hellenic history had been played, as it might have been played, by Athens (see IV. C (iii) (c) 2 (α), p. 264, and IV. C (iii) (c) 2 (β), pp. 306 and 314, above), or by Olynthus (see III. C (ii) (b), Annex IV, in vol. iii, above), then in a later age the Holy See would have been established on Attic or Chalcidian ground and not in the Ager Vaticanus. It is true that the Popes who laid claim to the loyalty and allegiance of Western Christendom from the eighth century onwards did not base their claim upon the former political supremacy of Pagan Rome. The name of power in which they spoke was not the name of Romulus or Caesar or Augustus, and not even the name of Constantine, but the name of Peter; and their text was not *Tu regere imperio populos, Romane, memento* but 'Upon this rock I will build my church', while the insignia in which they depicted the nature of their authority were the keys and not the *fascēs*. At the same time it is certain that Peter would never have become connected with Rome (and this is equally certain, whether we regard the connexion as historical or as legendary) if Rome had not already played her historic part in secular history before the beginning of the Christian Era. The association of 'the Prince of the Apostles' with the *caput mundi* was inevitable; and their union would have been consummated without fail even if the capital of the world into which the Christian Church was born had happened to lie elsewhere—in Olynthus or in Athens or wherever it might have been. We may therefore affirm that the fortune of 'the Eternal City' would not have been made for the second time by Saint Peter if it had not been made in the first instance by the statesmen and generals who were the architects of the Roman Empire. It was the Scipios and the Gallios who unwittingly secured for Rome the priceless boon of becoming the Apostle's resting-place. How astonished these patriots would have been if the Delphic Apollo had informed them that their mundane labours were to result in turning their Rome into the holy city of an Oriental religion, and that no other benefit which they could conceivably confer upon her could be so great as this unwitting and involuntary gift. (For the legacy of Pagan Rome to Christian Rome see Schneider, F.: *Rom und Romgedanke im Mittelalter* (Munich 1926, Drei Masken Verlag).)

exercise of this wider authority by a local ecclesiastical functionary was rendered possible by the presence, in every part of the area over which this arch-priest claimed jurisdiction, of a clergy which was recruited, trained, and disciplined on a more or less uniform plan, was united by a potent *esprit de corps*, and was of one mind in looking to the shepherd of souls in the *ci-devant* political capital as the divinely appointed head and centre of a Church Universal. These points of resemblance between Hildebrand's *Respublica Christiana* and Hrihor's *Respublica Ammoniaca* are striking; but behind them all there is one essential difference between the two institutions. Hrihor simply assumed the secular crown¹ which had been worn by the lay rulers of 'the Middle Empire' and 'the New Empire' (the original and the resuscitated Egyptian universal state) from the era of the Eleventh Dynasty down to the reign of the last *fainéant* Ramsid whom Hrihor himself had brushed aside; but this mere transference of a traditional secular authority from the hands of an effete lay dynasty into those of a capable and powerful ecclesiastical functionary was neither a political nor a religious success. The assumption of an alien office taxed the resources and drew upon the prestige of the Chief Priest of Amon-Re without bringing back to life the defunct authority of the Pharaoh whom the priest was impersonating.² The ecclesiastical usurper quickly became as impotent as the secular sovereign whom he had replaced; and, although his descendants prudently forbore from following Hrihor's example in assuming the Pharaonic style and title,³ they were compelled in the tenth century B.C. to yield up their hereditary Chief Priesthood of Amon-Re, together with the *de facto* government of the Thebaid, with which this ecclesiastical office was now bound up, to the descendants of the intrusive Libyan war-lords who had carved up other portions of the derelict domain

¹ Hrihor gives himself the full Pharaonic style and title in his inscriptions (Meyer, E.: 'Gottesstaat, Militärherrschaft und Ständewesen in Ägypten (zur Geschichte der 21. und 22. Dynastie)' in *Sitzungsberichte der Preussischen Akademie der Wissenschaften, Jahrgang 1928, Philosophisch-Historische Klasse* (Berlin 1928, de Gruyter), pp. 495-532).

² Hrihor attempted to bolster up his political authority by entering into an *Ausgleich* with a secular Pharaoh, Smendes of Tanis, who was the *de facto* ruler of the Delta. This Deltaic partner was a pillar of strength for the priest-king of the Thebaid, since the political centre of gravity of the Egyptian World had passed from the Thebaid to the Delta as far back as the thirteenth century B.C. (see II. D (v), vol. ii, pp. 112-18, above). Conversely, the traditional religious prestige of the Theban deity no doubt made it well worth while for Smendes to enter into partnership with Hrihor. Either partner seems to have assumed, with the other partner's acquiescence, a plenitude of the Pharaonic power within his own *de facto* domain; and their relation must have been not unlike that which subsisted between the co-emperors who held the Roman Imperial office in commission at various times from the generation of Diocletian to that of Zeno. The Pharaonic crowns of Tanis and Thebes were united on the head of Pinozem I, who was Hrihor's grandson and at the same time son-in-law of Smendes' son and successor Pausennes (Psibkhenno) I. When, however, Pinozem I actually entered into his Tanitic secular heritage, he abdicated from his Theban Chief Priesthood and conferred this upon one of his sons (Meyer, op. cit., pp. 496-8).

³ Meyer, op. cit., p. 497.

of 'the New Empire' into barbarian 'successor-states'.¹ Hrihor had failed to prevent the breakdown of the Egyptiac Society, and *a fortiori* he had brought no new society to birth. In contrast, Hildebrand and his successors in the Holy See never thought of taking to themselves the Roman Imperial Crown. They set themselves a more ambitious aim; and they were far more successful in their pursuit of it, because it was not only more ambitious but was also more practical. While they were wise enough to confine themselves to the ecclesiastical office from which their prestige and power were derived, they were bold enough to proclaim that this power, being of a different and a higher order, was superior to all secular powers within the ambit of the Pope's ecclesiastical jurisdiction. In taking this line and following it out, the Popes created a new system of society under which the nascent Western Civilization increased in wisdom and stature.²

Thus the analogy between Hildebrand's Roman hierocracy and Hrihor's Theban hierocracy breaks down at the crucial point;³ and the other obvious analogies fall still farther short of working out.

For instance, there are many other historical examples of priests taking on the burden of administering communities when a previous secular system of government has collapsed and disappeared. Among the derelict cities in the former domain of a broken-down Roman Empire Rome herself was not, of course, by any means the only one in which the local bishop stepped into the breach. In the western provinces of the Empire during the post-Hellenic interregnum the intervention of the bishops in secular affairs, and their assumption of civic responsibilities, was not the exception but the

¹ See II. D (v), vol. ii, p. 116, and IV. C (iii) (c) 2 (β), in the present volume, p. 422, above, and V. C (i) (c) 4, vol. v, pp. 352-3, below. When the Libyan war-lord of Harsieopolis, Shoshenq, took the place of the last of the Tanite Pharaohs *circa* 947 B.C., he installed his own son in the Chief Priesthood of Amon-Re at Thebes, in place of the last Chief Priest of the House of Hrihor (Meyer, *op. cit.*, pp. 513-14).

² Luke ii. 52.

³ There is, however, a genuine analogy between the Theban temple-state, into which Hrihor's dream of an Amonic *imperium* resolved itself, and the territorial sovereignty over a Central Italian principality which the Papacy was eventually to build for itself out of the ruins of the Hildebrandine *Repubblica Christiana* (see the present chapter, p. 577, below). From the generation of Hrihor onwards until the annexation of the Thebaid by Kashta King of Napata *circa* 750 B.C. (see II. D (v), vol. ii, p. 116, above) the Chief Priests of Amon-Re of Thebes continued to be the rulers of the Thebaid *de facto*, even when they did not bear the Pharaonic title, and even when the descendants of Hrihor were replaced in the Chief Priesthood of Amon-Re by cadets of the Libyan House of Shoshenq (see Meyer, *op. cit.*, pp. 498, 499, 513, 521). The Napatan conquerors took the administration of the Thebaid into their own hands, and transferred the trusteeship of the property of the Temple of Amon-Re from the Chief Priest of the god to an 'Adoratrix of the god' who was always a daughter of the reigning Napatan Pharaoh; and this new régime was perpetuated by the Saites when the Thebaid passed out of Napatan into Saite hands (Meyer, *op. cit.*, p. 521). Yet, though the Napatan conquest brought with it the extinction of Hrihor's Theban temple-state, it also brought a restoration of Hrihor's House to the sovereignty over its hereditary domain, if Meyer is right (see *op. cit.*, p. 531, and *Geschichte des Altertums*, vol. ii, part (2), 2nd ed., p. 52) in his conjecture that these princes of Napata were a branch of Hrihor's family which had retained its hierocratic authority—in the subsidiary temple-

rule; and in another connexion¹ we have already noticed how in the South-Western Asia of the last millennium B.C. a number of the Hittite and Syriac principalities that had been pulverized by the Assyrian militarism subsequently reappeared within the framework of the Achaemenian Empire in the new guise of temple-states. On the other hand no archbishop of Milan or Cologne, and no high priest at Comana or Jerusalem, ever emulated the achievement of the Bishop of Rome in enlarging the dominion which he had acquired within the restricted limits of his own see into an oecumenical dominion over the whole of the world of which his see was a part.

Again, when we consider how much of the Roman See's success in establishing the Papal *Respublica Christiana* was owing to the support which it received from the clergy throughout Western Christendom, we shall find the explanation of the clergy's power in the fact that between the Age of Constantine the Great and the Age of Hildebrand the clergy had become a distinct, and a privileged, caste;² and we shall be reminded of the position of privilege which the Brahmins acquired in the Indic World, and which they confirmed during the interregnum between the dissolution of the Indic Society and the emergence of its Hindu successor.³ Here again, however, the analogy is imperfect; for the Brahminical fraternity is a caste and nothing more, whereas the clergy of medieval Western Christendom was a caste which was also a corporation before it became a perfect hierarchy through accepting the supremacy of a single Roman head. While Brahmin has nothing in common with Brahmin except a liturgical prerogative and a privileged social status, the clergy whose primate was exalted to the highest pinnacle of authority in medieval Western Christendom were united not only by a common status and prerogative but also by their common membership in a more and more highly organized and effectively centralized ecclesiastical polity.

Another aspect of the Papacy's role in the medieval *Respublica Christiana* is that of mentor and censor; and here we may be reminded of the part which was played in the Hellenic World, during

state that centred round the local temple of Amon-Re at the Jabal Barkal—after the temple-state of the Thebaid itself had become an appanage of the Libyan House of Shosheng (see Meyer, *Gottestaat*, pp. 499 and 531). In any case it was in the Napatan principality that the principle of the supremacy of the priesthood in secular as well as in religious affairs was carried out to its extreme logical conclusion (Meyer, *op. cit.*, pp. 530-1).

¹ See IV. C (iii) (c) 3 (a), p. 471, above.

² A caste, however, which was recruited, not by physical procreation, like the Brahmins, but by co-option from among the laity, like the Confucian literati. Whereas the Brahmins are an aristocracy of birth, the medieval Western Christian clergy were—as the modern Roman Catholic clergy still are—an aristocracy of vocation.

³ For the historical relation between the Hindu and the Indic Society see I. C (i) (b), vol. i, pp. 85-7, above.

two or three centuries ending in 480 B.C.,¹ by the priesthood of the Delphic Apollo. Like the Apostle at Rome, the god at Delphi advised and reprimanded the Governments of the local states of the world over which he presided, besides dealing with private individuals. In particular, the activities of an Urban II or an Innocent III or a Gregory VIII or a Gregory X in evoking and directing the Crusades find their parallel in the activities of the Delphic Oracle in promoting and guiding an equally militant expansion of the Hellenic Society round the coasts of the Mediterranean in the eighth and seventh and sixth centuries B.C. But this analogy between the tutelary functions of Peter in Western Christendom and Apollo in Hellas is imperfect, like the other analogies which we have already suggested; and, here once more, the difference behind the likeness is fundamental. While the Apostle's authority was to some extent active and jussive, the god's seems to have been almost entirely passive and permissive. The Apostle sometimes took the initiative in issuing commands and prohibitions which were most unwelcome to the Governments or individuals concerned and which would certainly never have been solicited, even if they had to be obeyed when once they had been promulgated by the importunity of a pontiff who had not waited to be asked. On the other hand the god left it to his votaries to approach him or not as they chose, and if, when they did seek his advice, they elected to disregard it, they were free to flout his oracle at their peril. The god took no responsibility upon himself for guiding an inquirer's 'feet into the way of peace'.² A docile inquirer would have to congratulate himself, rather than give thanks to the Lord Apollo, if he were able to testify that 'by the word of thy lips I have kept me from the paths of the destroyer';³ and when an inquirer proved unteachable the god waited sardonically to see his own divine wisdom vindicated in the fullness of time by the human fool's catastrophe. Between Delphi and the rest of Hellas, as between Papal Rome and the rest of Western Christendom, there was a constant coming and going of messengers on sacred errands; but the most significant travellers on the roads which converged upon Delphi were the private inquirers or public *θεωποί*⁴ from the city-

¹ The prestige of Delphi never recovered from the devastating effects of the supreme error—of the heart as well as of the head—which the Delphic priesthood made in ranging itself on the side of the big battalions on the eve of Xerxes' invasion of European Greece. The damage was not repaired by the sedulous propagation of the legend of the god's miraculous intervention in defence of his shrine; and the blow was fatal—coming, as it did, at a moment when the authority of the oracle was bound in any case to be challenged in the light of the intellectual *Aufklärung* which was setting in in the generation of Aeschylus.

² Luke i. 79.

³ Psalm xvii. 4.

⁴ For the technical meaning of the Greek word *θεωπός* see III. C (ii) (b), vol. iii, p. 253, footnote 1, above.

states of Hellas, while the most significant travellers on the roads which radiated from Rome were perhaps the Papal *legati a latere* to the *mulūk-at-ṭawāʾif* in the provinces of Peter's spiritual empire. This difference in the direction of the more important traffic¹ points to a difference between the god's relation to his votaries and the Apostle's relation to his flock.

Of course the traffic between Papal Rome and her ecclesiastical provinces was not all outward-bound; for every road must also lead to a city from which every road radiates, and the outgoing traffic of legates and tax-gatherers was crossed by an incoming traffic of pilgrims, petitioners, and litigants. These visitors to Rome did not come merely to obtain in person the Apostle's judgements; they came to worship at his shrine and venerate his relics—acts of piety which could not be performed anywhere outside Saint Peter's Church in *Agro Vaticano*. This fact reminds us that the power of the Papacy in medieval Western Christendom was derived from yet one other thing besides the character and ability of the Pope himself and his Curia, the status and organization of the clergy throughout the domain of the Roman Patriarchate, the prestige which Christian Rome derived from her pagan predecessor, and the still greater prestige with which her bishop was invested in his capacity of successor to 'the Prince of the Apostles' who had honoured Pagan Rome by taking her for his see. The other thing, in addition to all these, which contributed to the Papacy's strength—and perhaps had more effect than anything else upon the imagination and emotion of the masses—was the possession of a unique talisman in the shape of the tomb which was reputed to contain the Apostle's mortal remains.² And this aspect of Papal

¹ Mr. Geoffrey Barraclough, who kindly read this chapter before publication, observes, in a letter to the writer: 'In spite of the beginning of the next paragraph, the active, directive side of Roman action seems to me to be overstressed—the element of passive reaction to the calls of private inquirers and private interests made too incidental. The latter was characteristic of Papal government more than the former; or at any rate it was the latter which accounted for the real centralization of the Church in the 13th and 14th centuries.' Fuller expositions of Mr. Barraclough's view on this point will be found in his *Papal Provisions* (Oxford 1935, Blackwell), ch. 12; in *Public Notaries and the Papal Curia* (London 1934, Macmillan), pp. 130–1; and in *The English Historical Review*, vol. xlix, pp. 214–16. On Mr. Barraclough's showing, the analogy between the medieval Papacy and the Delphic Oracle *prae* 480 B.C. is closer than had been supposed by the writer of this Study.

² It was this loadstone that drew the Vicar of Peter back to Rome in the fifteenth century after his migration to Avignon in the fourteenth. There was everything to be said for the migration from the standpoints of administrative convenience and social amenity. Rome—the decayed capital of an extinct Hellenic universal state—was situated in what was now a remote, backward, and turbulent province on the extreme south-eastern edge of the Western Christendom; and her situation had not been appreciably altered by the superficial Westernization of the Orthodox Christian domain in Southern Italy and Sicily as a result of the Norman Conquest in the eleventh century. On the other hand Avignon was an orderly, civilized place near the heart of the medieval Western World. It lay in the middle sector of Lothaire's portion of Charlemagne's heritage (see I. B (iv), vol. i, pp. 37–40, above), on the border-line between the Holy Roman Empire and France, in the valley of the Rhône (which, in spite of the growth of

Rome has a number of analogues in other holy cities: in Jerusalem with its Holy Sepulchre, in Medina with its tomb of the Prophet, in Najaf with its tomb of the Caliph and Martyr 'Alī, in Karbalā with its tomb of the Martyr Husayn, and in Canterbury with its tomb of the Prelate and Martyr Thomas Becket.¹ The Rome that contained the tombs of Saint Peter and Saint Paul resembled all these other sepulchre-cities in being a focus of emotion and a lodestar of pilgrimage; but this analogy breaks down like all the rest; for what sepulchre-city save Rome alone has ever succeeded in transmuting a focus of emotion into a seat of authority, and in exerting her magic influence over her pilgrims, not merely at the moment when they are standing, rapt and awe-stricken, on the threshold of the Holy of Holies, but throughout their working lives, in the humdrum environment of their homes?

It will be seen that there is a vein of uniqueness in the Papal *Respublica Christiana* which baffles our attempts to describe its character by the method of analogy. It can be better described, in negative terms, as an exact inversion of the 'Caesaro-papal' régime² against which it was a social reaction and a spiritual protest; and this description perhaps gives, better than any other, the measure of Hildebrand's achievement.

When the Tuscan Hildebrand took up his abode in Rome, as a stranger within her gates, in the second quarter of the eleventh century, he found himself in a derelict outpost of the East Roman Empire which was occupied by a degenerate offshoot of the Byzantine Society. For three centuries past, the natives of the Ducatus Romanus had shown themselves incapable not only of defending their own borders against their Lombard neighbours in Gregory's own Tuscany and in the Basin of the Po, but even of keeping order among themselves when a Transalpine Power stepped in to hold

the traffic over the Brenner, was still the main highway between the Cisalpine and the Transalpine portion of the domain of the Roman Patriarchate). Situated as it was, Avignon was well on the way from the traditional ecclesiastical headquarters of Western Christendom on the lower Tiber to its genuine headquarters of that day in the upper valley of the Saône—at the junction of the routes between the basins of the Rhône, the Rhine, and the Seine—in a Burgundy which embraced Luxeuil (see II. D (vii), vol. ii, p. 330, above) and Cluny and Cîteaux. The fact that, notwithstanding these overwhelming material advantages, Avignon was unable to hold its own against Rome as an alternative residence for the Holy See, gives the measure of the importance of the Tomb in *Agro Vaticano* as a source of Papal prestige and power.

¹ The sagacious Ptolemy Sôtér sought to head this list of sepulchre-cities with the name of Alexandria when he took possession of the founder's body and built a tomb for it in the most famous of the cities that had been called after Alexander in his lifetime. Ptolemy grasped the importance of the prestige which it was possible for a city to derive from the possession of the relics of an historic personality. In the event, however, it was not as the site of Alexander's sepulchre, but as the political capital of Ptolemy's Empire and as the workshop of the Hellenic World, that the Egyptian Alexandria grew to greatness.

² For a definition and discussion of 'Caesaro-papism', apropos of the idolization, in Orthodox Christendom, of a resuscitated ghost of the Roman Empire, see IV. C (iii) (c) 2 (8), pp. 347-8, above.

the Lombards at arm's length. And these latter-day Romans were financially and spiritually bankrupt besides being militarily weak and socially turbulent. The overseas portion of the *Patrimonia Petri* or Papal estates, which had still supplied Gregory the Great with resources for keeping alive the population of a *ci-devant* capital city,¹ had subsequently gone the way of the estates on the Italian mainland during the four centuries that had elapsed between the death of the first Gregory and the birth of his seventh Papal namesake; and in the eleventh century the Papacy no longer possessed any assured or regular sources of income.² As for the moral bankruptcy of the *Ducatus Romanus* in that age, it is revealed not merely in the sordid annals of its social history but in the necessity in which the Romans now found themselves of looking abroad for spiritual light and leading. To raise the local standard of monastic life the Romans had to turn for help and guidance to Calabria³ and to Cluny; and the first attempts to regenerate the Papacy took the form of passing over Roman candidates and appointing Transalpines. The precedent was set by the appointment of the Saxon Emperor Otto III's former tutor, the French scholar Gerbert of Aurillac, who mounted the Papal throne as Sylvester II (*pontificali munere fungebatur* A.D. 999-1003); and, after a reversion to Popes of Roman birth which ended in the humiliation of A.D. 1046, the Chair of St. Peter was not occupied by a Roman again until the election of Innocent II in A.D. 1130. Of the fourteen Popes who reigned in the interval, eight were Transalpines,⁴ two were Tuscan Lombards, two were South Italians, and two were Romagnols. This shows how low the reputation of the Roman people stood in the eyes of a Western World which was now to be brought under the spell of the Roman See by the work of Hildebrand and his successors.⁵ The

¹ See III. C (ii) (b), vol. iii, p. 269, above.

² See p. 536, footnote 2, below.

³ See IV. C (iii) (c) 2 (b), p. 357, above.

⁴ The Tyrolean Poppo of Brixen, who became Pope Damasus II in A.D. 1048, may be reckoned among the Transalpines for sociological purposes, in spite of the physiological fact that Brixen lies on the southern side of the watershed between the Adige and the Inn.

⁵ What the Lombards thought of the Romans before Rome was restored to glory by the Tuscan Lombard Hildebrand is revealed in the following passage from the works of Liutprand of Cremona, who was Hildebrand's senior by about a hundred years. The passage occurs in the twelfth chapter of Liutprand's report on his mission to Constantinople in A.D. 968. He is describing the high words that passed between himself and the East Roman Emperor Nicephorus Phocas during a dinner-party that the Emperor was giving in his honour.

"When I was on the point," writes Liutprand, "of answering him back . . . he would not let me, but added, by way of insulting me: 'You are not Romans, but Lombards!' He wanted to say more, and signed to me with his hand to keep quiet, but I lost my temper and burst out. 'That fratricide Romulus,' I said, 'after whom the Romans are named, was a son of a whore—born, I mean, in adultery—as every schoolboy knows. What he did was to set up an *alsatia* in which debtors, fugitive slaves, murderers, and other criminals whose lives were forfeit received asylum until their numbers mounted up to a mob of undesirables whom their host dubbed Romans. This is the noble origin of the people whom you style the Lords of the World (*hismocratores, id est imperatores*). And these are also the people whom we—and by 'us' I mean us Lombards, Saxons,

only special asset which the Ducatus Romanus possessed was a certain precocity in the art of administration which it displayed in common with the main body of the Byzantine World.¹ This was the unpromising site on which Hildebrand laid the foundations of his *Respublica Christiana*.

In this despised and alien Rome Hildebrand and his successors succeeded in creating the master-institution of Western Christendom. They won for Papal Rome an empire which had a greater hold than the Empire of the Antonines upon human hearts, and which on the mere material plane embraced vast tracts of Western Europe, beyond the Rhine and Danube, where the legions of Augustus and Marcus Aurelius had never even set foot, not to speak of establishing a permanent occupation. Indeed, this Papal dominion was wider than Charlemagne's, who had succeeded—though at ruinous cost²—in advancing his frontier from the Rhine to the Elbe and thereby achieving a feat which had proved to be beyond the strength of Augustus; for even Charlemagne never pushed his conquests beyond the Channel or the Baltic, while the medieval Papacy had inherited a spiritual dominion over England from the pontificate of Gregory the Great, two hundred years before Charlemagne's time, and had gone on to make a spiritual conquest of Scandinavia some two hundred years after Charlemagne's death.

These Papal conquests were partly due to the constitution of the Christian Republic whose frontiers the Popes were enlarging; for it was a constitution which inspired confidence and affection instead of evoking hostility and resistance.³ The Papal *Respublica Christiana* was based on a combination of ecclesiastical centralism and uniformity with political diversity and devolution; and, since the superiority of the spiritual over the temporal power was a cardinal point of constitutional doctrine, this combination made the note of unity predominant, without depriving the adolescent Western Society of those elements of liberty and elasticity which are indispensable conditions for growth. Indeed, the acceptance of the social unity of Western Christendom, which was implicit in a common recognition of the spiritual authority of the Pope, carried with it a certain guarantee for the political independence of any local

Franks, Lorrainers, Bavarians, Swabians, and Burgundians—despise so utterly that, when we lose our temper with our enemies and want to insult them, we pronounce the single word 'Roman!'—conveying, in the use of this pregnant appellation, all the baseness and cowardice and avarice and effeminacy and mendacity of which human nature is capable."

² See II. D (v), vol. ii, p. 167; II. D (vii), vol. ii, p. 345; IV. C (iii) (c) 2 (β), in the present volume, pp. 322–3; and IV. C (iii) (c) 3 (α), pp. 488–90, above.

³ On this point see IV. C (iii) (c) 2 (β), in the present volume, pp. 377–9, above.

community that took upon itself the Papal yoke—a burden which, in the eleventh century, was still apostolically light. It was by entering into direct relations with the Holy See, and thereby becoming acknowledged members of the Western Christian Society in their own right, that the newly converted barbarian kingdoms of Hungary and Poland exorcised the danger of being conquered and annexed by the *Regnum Teutonicum* as the Saxons, in their day, had been forcibly 'Westernized' by Charlemagne, and as the Irish and the Prussians in a later century were to be subjected, respectively, by the English Crown and by the Teutonic Order.¹ Thanks to the Holy See the Hungarians and the Poles were able, like the English, to enjoy the social and cultural benefits of membership in the society of Western Christendom without having to pay the price of forfeiting their political independence. It was also thanks, in large measure, to an alliance or community of interests with the Holy See that the city-states of Lombardy were able to vindicate their political autonomy against the Emperor Frederick I and to maintain it against the Emperor Frederick II.²

Nor was the medieval Papacy illiberal in its attitude towards aspirations after local self-government, even in those Central Italian territories over which it claimed secular as well as ecclesiastical authority in virtue of the successive donations of Pepin and Charlemagne and Matilda. It appears to have accepted the situation without protest when the movement which was turning cities into city-states spread from Lombardy, where it had first asserted itself, into Romagna and the Marches and Umbria. In Tuscany in A.D. 1198 Pope Innocent III gave his recognition to the newly formed league of city-states, and urged Pisa to join it; and this benevolence extended to the Ducatus Romanus itself, which was the Papacy's metropolitan province. The Papal influence was here exerted to protect the nascent civic liberties of Tivoli and Tusculum and Viterbo against the aggressiveness of the citizens of Rome; and the Holy See was quick to make peace with the civic movement in Rome itself when it broke out there, in 1143, in a militant and revolutionary form. The Roman revolution of 1143 was followed by the settlement of 1145 between the new republic and Pope

¹ The subjugation of Ireland by the English Crown was sanctioned in advance by an incumbent of the Papal office who was perhaps unable to forget that, before he became Pope Hadrian IV, he had been the Englishman Nicholas Breakspear (for the Bull *Laudabiliter* see II. D (vii), vol. ii, p. 337, footnote 1, above); but this case seems to be exceptional. Indeed, it is the only notable instance in which the medieval Papacy lent its authority to promote the conquest of a small and weak community within the bosom of Western Christendom by a large and strong one. The part played by the Papacy in helping Hungary and Poland to escape the heavy yoke of the Holy Roman Empire, and the city-states of Lombardy to throw it off, is more characteristic of the Papal policy towards the political system of medieval Western Christendom.

² See III. C (ii) (b), vol. iii, pp. 345-6, above.

Eugenius III; and this settlement was revised and renewed in 1188 during the pontificate of Clement III.

At the turn of the twelfth and thirteenth centuries, when the civic movement was in full flood in Italy and when the Papal authority stood at its zenith over Western Christendom, a Welsh poet was 'pointing out . . . how strange it was that the Pope's censure, which in Rome could not move trifles, was elsewhere making the sceptres of kings tremble; and that he to whom in Rome a poorly kept garden would not yield was striving to bend kingdoms to his nod'.¹ Giraldus Cambrensis fancied that he was here exposing a paradox which was a theme for satire; but if this was one of the subjects which he discussed with Pope Innocent III in an interview which the Pope once granted him in a leisure hour,² we may conjecture that the Pontifical statesman found little difficulty in convincing the Welsh man-of-letters of his error. The very reason why in this age a majority of the princes and city-states of Western Christendom accepted the Papal supremacy with little demur was because the Pope was not then under suspicion of attempting to trespass upon the domain of the secular power.³ So far from claiming a monopoly of territorial sovereignty, like the contemporary emperors at Constantinople, or a primacy *inter pares*, like the Holy Roman Emperors in the West from Otto the Great onwards in their relations with the independent kings of France or England or Leon, the Holy See in this age was not concerned in the competition for territorial rulership.⁴ It was exercising on an occu-

¹ Mann, the Right Reverend Monsignor H. K.: *The Lives of the Popes in the Middle Ages* (London 1910-29, Kegan Paul, 15 vols.), vol. xi, p. 72. The original Latin of Giraldus's verses runs as follows:

Mirum quae Romae modicos sententia papae
non movet, hic regum sceptrum movere potest.
quae minimos minime censura coerces in urbe
saevit in orbe fremens celsaque colla premens.
cui male sublatus Romae non cederet hortus
nititur ad nutum flectere regna suum.

Giraldi Cambrensis Opera, edited by Brewer, J. S., vol. i (London 1861, Longmans Green), p. 377 (with another version on p. 374).

² See Mann, op. cit., vol. xi, p. 68.

³ Evidence, drawn from Innocent III's own letters, that he 'did not, as Pope, claim supremetemporal power', is presented in Carlyle, R. W. and A. J.: *A History of Mediaeval Political Theory in the West*, vol. v (Edinburgh and London 1928, Blackwood), p. 158.

⁴ There was, however, in Hildebrand's day—and presumably under Hildebrand's inspiration—a movement in the Papal Curia to secure a recognition of the Holy See's feudal overlordship over Western Christian kingdoms which lay outside the limits of the Holy Roman Empire. The Norman principalities in Southern Italy accepted this status of vassalage to the Holy See in A.D. 1059, Aragon in 1063, Dalmatia in 1076, Provence in 1081, Tarragona in 1091, Portugal circa 1140. On the other hand, England rejected a proposal that she should enter into this status circa 1079, and France circa 1081 (Dufourcq, A.: *L'Avenir du Christianisme: Première Partie: Histoire Moderne de l'Eglise*, vol. vi, fourth edition (Paris 1924, Plon), p. 167). After his accession to the Papacy, Hildebrand made similar proposals to the Kings of Hungary and Denmark, to the Corsicans, and even to a Russian prince (see Carlyle, R. W. and A. J.: *A History of Mediaeval Political Theory in the West*, vol. iv (Edinburgh and London 1922, Blackwood), Part I, ch. 4.

menical scale an authority of a spiritual character which was on a different plane from any territorial prerogative, and which, so long as it remained on this plane, did not become a danger to local political liberties.¹ The proof positive of the Pope's intention to stand above the territorial battle, and of his unwillingness to descend into the arena, was his acquiescence in his own practical exclusion from participation in the civil government of the city which was his episcopal see; and in this light the contrast between the Pope's impotence in Rome and his power in Western Christendom at large is seen to be no paradox at all, but a necessary consequence of the constitution of the *Respublica Christiana*. It is not too much to say that throughout the history of the Papacy down to the present day the oecumenical religious authority of the Popes and their local territorial power have regularly varied in inverse ratio with one another.

This statesmanlike aloofness from territorial ambitions was combined, in the Papal hierocracy at its zenith, with an energetic and enterprising use of the administrative gift which was the Byzantine dowry of Papal Rome. While in Orthodox Christendom this gift had been fatally applied to the *tour de force* of putting substance into a resuscitated ghost of the Roman Empire, and thereby crushing an adolescent Orthodox Christian Society under the incubus of an institution which was too heavy for it to bear,² the Roman architects of the *Respublica Christiana* turned their administrative resources to better account for building a lighter structure, on a new plan, upon broader foundations. The gossamer filaments of the Papal spider's web, as it was originally woven, drew medieval Western Christendom together into an unconstrained unity which was equally beneficial to the parts and to the whole. It was only later, when the fabric coarsened and hardened in the stress of conflict, that the silken threads changed into iron bands, and that these

¹ On this passage the writer has received the following comment from Mr. G. Barraclough:

"'Authority of a spiritual character' is good theory; but such authority has to exercise itself on material things, and there is no guarantee that the boundaries, distinct enough in most spheres, will not become blurred in others. That is, e.g., the difficulty in England. Henry II, Edward I, and Henry IV all grant up mere *spiritualia* to the Pope—or, better, cannot conceive themselves as having any interest in them. But they take a different attitude regarding *causae spirituali annexae* or *causae mixtae*. Thus, in regard to the benefice, is it the *officium* which counts, and is any dispute therefore 'spiritual'? This in regard to the one point of jurisdiction. It can be agreed that the Pope did not then 'attempt to trespass'; neither did the Kings—but there was a 'no-man's-land'. They tried to settle the problems that this raised impartially (cf. Mollat, G.: 'L'Application du Droit de Régale Spirituel en France' in the *Revue d'Histoire Ecclésiastique*, 1929, for the Parliament of Paris; Barraclough, *Papal Provisions*, p. 85, for the Roman Rota) and not to make capital out of them; but it was not always easy to do so even in fact, and certainly not in theory. Thus you get the position implied in the phrase: 'Dñs Papa scit et tolerat!' On the major scale of politics, what of Innocent III's interventions all over the medieval world? From his point of view, he was justified in regarding it as an exercise of spiritual authority, but it was natural that others did not.'

² See IV. C (iii) (c) 2 (β), pp. 320-408, above.

came to weigh so heavily upon the local princes and peoples, and so grievously to restrict their movements and cramp their growth, that at last they burst their bonds in a temper in which they hardly cared if, in severally liberating themselves, they were destroying that oecumenical unity which the Papacy had established and preserved.¹

In that Papal work of creation it was not, of course, either a capacity for administration or an avoidance of the snare of territorial ambitions that was the vital creative force. The fundamental reason why the Roman See was able in this age to conjure into existence a Christian Republic under a Papal aegis was because, at this stage, the Papacy threw itself without hesitations or reservations into the task of giving leadership and expression and organization to an adolescent Western Civilization's awakening desires for a higher life and a larger growth. The Hildebrandine Papacy identified its own purpose and *raison d'être* with aspirations which were dimly and dumbly stirring in the hearts and minds of the *Plebs Christiana*; it gave these aspirations form and fame, and thereby transformed them from the day-dreams of isolated individuals or scattered minorities into common causes which carried the conviction that they were supremely worth fighting for, and which swept men off their feet when they heard these causes preached by Popes who were staking upon them the fortunes of the Holy See and perhaps their own lives as well. The victory of the Christian Republic was won in the Papal campaigns for the purification of the clergy from the two moral plagues of sexual incontinence and financial corruption, for the liberation of the life of the Church from the interference of secular powers, and for the rescue of the Oriental Christians and the Holy Land from the clutches of the Turkish champions of Islam; but this was not the whole of the Hildebrandine Papacy's work; for the great Popes under whose leadership these 'holy wars' were fought on those diverse fronts were not entirely engrossed in the struggles of the Church Militant. Even in the times of greatest stress they had a margin of thought and will to spare for works of peace in which the Church was displaying her finest self and was exercising her most creative activity. Pope Alexander III (*fungebatur* A.D. 1159-81) was fostering the nascent universities of the West at a time when he was a penniless refugee, with an Emperor lunging at him from one flank and an Antipope snapping at him from the other. And the series of movements in which a torpid monasticism was first reawakened at Cluny and Cîteaux and then transformed into a new thing by Saint Dominic and Saint Francis, were each in

¹ See IV. C (iii) (b) 11, vol. iv, pp. 214-22, above.

turn observed, approved, supported, and propagated by the Holy See, though it was the exception and not the rule for the Pope himself to be a member of a religious order.

This genius for descrying the seeds of noble things and for bringing the crop to harvest was the crowning virtue of the Papacy in the days of its Hildebrandine greatness; and this genius was not displayed only in a fruitful patronage of promising institutions like the universities or the religious orders; besides being an august patron of institutions the Papacy was an apostolic fisher of men;¹ and its greatest triumph was its enlistment of the purest souls and ablest wits and strongest characters of Western Christendom in the service of the Holy See—a service which was embraced with enthusiasm by eminent men and women because it offered them scope for living lives and doing deeds for which there was no opportunity in the secular world. These valiant and faithful servants of the Holy See were drawn from every country of Western Christendom and from every class of society and from every type of character. There were mystics and intellectuals and men of action; monks and kings and peasants and lawyers; Lombards and Burgundians and Frenchmen and Germans and Romans—for the very *faex Romana* which an Otto III and a Henry III had justly judged unworthy, in their day, to supply a Roman candidate for the Roman See, gave birth in the following century to that noble Lotario de' Conti di Segni who was to ascend, as Innocent III, a throne which had been disgraced by the Theophylacts and Crescenzi.

In this goodly company of *servientes servo servorum Dei* there were some, like Hugh of Cluny and Bernard of Clairvaux and Matilda of Tuscany and Louis IX of France, who performed their service in the provinces or *outré mer*, while others were called from the ends of the Earth to do their work in the Curia and there perhaps to rise, through the Cardinalate, to the highest position attainable by any citizen of the medieval Western Republic.

The first name on the roll of eminent servants of the Holy See in the Hildebrandine Age who completed their service in the Papal chair is that of Hildebrand himself: the greatest man of action in the history of our Western Society hitherto, if greatness is to be measured by the nature of the aim as well as by the extent of the performance.² Ildebrando Aldobrandeschi was the child of a Tuscan peasant who was sent to Rome to be educated; was taken into

¹ Matt. iv. 19.

² 'His was that rarest and grandest of gifts: an intellectual courage and power of imaginative belief which, when it has convinced itself of aught, accepts it fully with all its consequences and shrinks not from acting at once upon it.'—Bryce, James: *The Holy Roman Empire*, chap. 10.

the Papal Curia by his schoolmaster when Giovanni Graziano became Pope Gregory VI; and served the Holy See thereafter for 28 years (A.D. 1045-73) before he himself became Pope Gregory VII (*fungebatur* A.D. 1073-85).

The second of the six predecessors of Pope Gregory VII who leaned in turn upon the deacon Hildebrand, and never found him a broken reed, was Bruno of Egisheim, the son of an Alsatian nobleman who was a first cousin of the Saxon Emperor Conrad II. Educated for the Church, Bruno qualified himself for the highest office in it by serving a twenty-three years' apprenticeship in his native Lotharingia. Nominated for the Papacy by the Emperor Henry III in response to a request from the Romans themselves for an Imperial nominee, Bruno only accepted the nomination on condition that it was confirmed in Rome, upon his arrival there, by a free election; and it was on this understanding that Hildebrand, on his part, accepted Bruno's pressing invitation to go to Rome with him as his right-hand man.¹ The noble friendship and potent collaboration of the Alsatian and the Tuscan during Bruno's pontificate as Leo IX (*fungebatur* A.D. 1049-54) launched the Hildebrandine movement on its historic course with a momentum which continued to carry it onward for more than two hundred years.

Among Hildebrand's successors, Odo of Châtillon-sur-Marne was a knight's son who became a monk of Cluny and then served the Curia as Cardinal of Ostia before he became Pope Urban II (*fungebatur* A.D. 1088-99) and translated into action one of Hildebrand's cherished projects when he launched the First Crusade.²

The Romagnol Rainer of Blera was another monk of Cluny who became Pope Paschal II (*fungebatur* A.D. 1099-1118) and all but succeeded in settling with the Emperor Henry V the formidable question—over which Henry IV and Hildebrand had joined battle—of where the line was to be drawn between the respective jurisdictions of Church and State.³

Guy de Vienne was a Burgundian prince who was Archbishop of his own city before he became Pope Calixtus II (*fungebatur* A.D. 1119-24) and brought to terms, by hard fighting and shrewd

¹ Hildebrand had left Rome in 1047 in order to accompany his first master, Pope Gregory VI, in his Transalpine exile; and, after travelling with him to Cologne, he had travelled on, after the exiled Pope's death, to Cluny. From Cluny he had come, like Bruno, to Worms in order to attend the conference which was convened there by the Emperor Henry III for taking action on the Roman request. When Bruno, after his nomination, invited Hildebrand to go to Rome with him, Hildebrand consented against his own desire, as a matter of ecclesiastical obedience.

² See V. C (i) 3, vol. v, pp. 242-4, below, for the origin and range of a movement of Western expansion in which the First Crusade was not quite the first step.

³ On the difficulties of this problem—which is still a cause of perplexity and strife in the latter-day Western World of our own generation—see Mr. G. Barraclough's observations on p. 526, footnote 1, above.

530 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS

Bernardo Paganelli was a Tuscan nobleman—a son of the lord of Montemagno in the Lucchese—who became a monk of Clairvaux and was sent by St. Bernard to serve Pope Innocent II in Rome—a service in which he rose to be Pope Eugenius III (*fungebatur* A.D. 1145–53), the negotiator of the settlement of A.D. 1145 between the Holy See and the revolutionary Roman Republic.

Rolando Rainucci, or Bandinelli, was a Sieneſe canonist who learnt his law at Bologna, was brought to Rome and made a cardinal by Pope Eugenius III, and justified his master's opinion of him by the indomitable courage with which he held out victoriously against the Emperor Frederick I and three successive Antipopes as Pope Alexander III (*fungebatur* A.D. 1159–81).¹

Ubaldo Allucingoli was a canonist from Lucca who, as Pope Lucius III (*fungebatur* A.D. 1181–5), knew how to hold the ground which Alexander III had won from the Emperor Frederick.

Umberto Crivelli was the son of Milanese parents—belonging to the prosperous bourgeoisie—who became a canon of Bourges, and afterwards Archbishop of his native city, before he failed, for all his fulminations, as Pope Urban III (*fungebatur* A.D. 1185–7), to prevent the marriage of Frederick's son Henry with Constance of Sicily.

Alberto di Morra was a Beneventan monk of the Premonstratensian monastery of Saint Martin at Laon who served the Holy See as Papal Chancellor before, as Pope Gregory VIII (*fungebatur* A.D. 1187), he became a peacemaker—first between the Holy See itself and the Holy Roman Empire, and then between Pisa and Genoa—in the cause of the Crusades.

Lotario de' Conti di Segni was a nobleman of the Ducatus Romanus who studied in the universities of Paris and Bologna before he was called, at the early age of 37, to preside over the Hildebrandine Church, in its hour of noonday splendour, as Pope Innocent III (*fungebatur* A.D. 1198–1216).

Cencio Savelli was a member of another noble Roman house who served the Curia as *Auditor* (judge) and *Camerarius* (treasurer) before he ascended the Papal throne as Pope Honorius III (*fungebatur* A.D. 1216–27) and attempted to cope with a plausibly evasive Frederick II.

Ugolino de' Conti di Segni was a great-nephew of Pope Innocent III who, as Cardinal of Saint Eustachius, half appreciated and half patronized Saint Francis of Assisi, and who ventured, as Pope

¹ In Mr. Barraclough's judgement (*Papal Provisions*, p. 1) it was Alexander III who translated Gregory VII's claims into accomplished facts.

Gregory IX (*fungebatur* A.D. 1227-41), to try conclusions, in the strength of his worldly wisdom, with 'the Wonder of the World' who had baffled Pope Honorius III.

Sinibaldo Fieschi, son of Ugo Count of Lavagna, was a Genoese canonist who served as Papal *Auditor* and Vice-Chancellor and Rector of the Marche before, as Pope Innocent IV (*fungebatur* A.D. 1243-54), he threw himself—'impiger, iracundus, inexorabilis, acer'¹—into the festering war between the Holy See and the Emperor Frederick II, and waged it *ad internecionem*.

Rainaldo de' Conti di Segni was a nephew of Pope Gregory IX who carried on the Papal struggle against the Hohenstaufen as Pope Alexander IV (*fungebatur* A.D. 1254-61) without departing from his predecessor's policy in this respect, but who at the same time tried to save the Church herself from the evil effects of the political conflict by revoking many of Innocent IV's ruinous acts,² following in regard to the Friars the more generous policy of his own kinsman and predecessor Gregory IX, and preparing the way for Gregory X's valiant strivings to bring about a spiritual rally.

Jacques Pantaléon was the son of a tradesman in Troyes who studied in the University of Paris, became a canonist, served Pope Innocent IV as his legate militant in Germany, and eventually dealt 'the knock-out blow' to the House of Hohenstaufen with his own hand when, as Pope Urban IV (*fungebatur* A.D. 1261-4), he induced the relentless Charles of Anjou to accept the crown of Sicily.

Guy Fulcodi was the son of a nobleman of St. Gilles in Languedoc who had served the Counts of Toulouse as a legal adviser. Guy himself performed the same service for King Louis IX of France till he was made a cardinal by Pope Urban IV and then became Pope himself as Clement IV (*fungebatur* A.D. 1265-8). In passing over from the Law to the Church, and rising from the Cardinalate to the Papal Throne, Fulcodi never won his manumission from the service of a royal master; he merely exchanged a Louis for a Charles; and the exchange was unfortunate; for, if Louis was a saint whose service was perfect freedom, Charles was a hard man, reaping where he had not sown and gathering where he had not strawed.³ For all his uprightness, Pope Clement sank from being Charles' patron to becoming his accomplice, and from being his accomplice to becoming his tool, while the cold-blooded Angevin dealt with the brood of Frederick II as Jehu had dealt with the House of Ahab.⁴

¹ Horace: *Ars Poetica*, l. 121.

² See the criticism of Innocent IV by Alexander IV that is quoted on p. 539, footnote 4, below.

³ Matt. xxv. 24.

⁴ 2 Kings x. 1-11.

Tibaldo Visconti of Piacenza was a student of the University of Paris and Archdeacon of Liège whose heart was in the Crusades. In this cause he laboured single-mindedly as Pope Gregory X (*fungebatur* A.D. 1271-6) at the Council of Lyon in A.D. 1274 to bring to an end 'the Great Interregnum' which had been inflicted upon the Holy Roman Empire by Pope Innocent IV, as well as to heal the schism between the Western and the Orthodox Church. The crusade which he had worked for was in sight when Death overtook him.

Pietro di Morrone was the eleventh son of an Abruzzese peasant who lived as a hermit in the wilderness before the Conclave elected him to be Pope Celestine V (*fungebatur* A.D. 1294), and who abdicated, less than four months after his consecration, from an office which was a torment to him.

Benedetto Gaetani was a nobleman of Anagni who studied the civil as well as the canon law, became a Papal notary and a cardinal, and put his worldly wisdom at the service of Pope Celestine V in order to smooth the path for his unworldly master's 'Great Refusal'¹ and for his own eager but unfortunate acceptance, as Pope Boniface VIII (*fungebatur* A.D. 1294-1303), of the tiara whose weight the hermit could not endure.

This bare list of famous names² is enough to show that the medieval Papacy, like the modern English governing class and the Ottoman Pādishāh's Slave-Household, had the power of attracting into its service all the talents of the society in which it was the master-institution.³ The first impression which the list will make on our minds is that of the extraordinary variety of the aptitudes and experiences which the Hildebrandine Church knew how to use in a cause which was so much vaster and so much grander than the *raison d'être* of any national state or multi-national empire. A closer scrutiny will show that these diverse types of eminence were not all equally apt for doing the precise and special work of controlling the destinies of the Christian Republic through the instrumentality of the Roman Curia. The fortunes of a Gregory VI or a Paschal II—not to speak of Celestine V—suggest that a man who was eminent as an unworldly saint would perhaps find himself at a disadvantage on the Papal throne, where he might be hindered by his office from exercising his gifts and be hampered by his gifts

¹ Dante: *La Divina Commedia*: 'Inferno', Book III, l. 60.

² If we read the roll-call aloud, it is the Lombard names, with their sonorous Italian setting and their intractable Teutonic core, that engrave themselves most deeply on the memory—calling up, as they do, the incisive characters of the great men of action who bore them. A similar impression is made by the South Slavonic names in the roll of the Ottoman vezirs.

³ The kinship of the Roman Church with the Ottoman Slave-Household in this respect is pointed out by the American scholar Dr. A. H. Lybber in a passage which has been quoted in this Study in Part III. A, vol. iii, p. 33, above.

from fulfilling his office. When we compare the respective results of a Paschal II's and a Calixtus II's dealings with a Henry V, we may be inclined to think that the virtues of a saint were a less valuable endowment than the family tradition of a sovereign count¹ for a Pope who was called upon to live up to the Hildebrandine faith that God had

'made him lord of his house and ruler of all his substance,
'To bind his princes at his pleasure and teach his senators wisdom.'²

A count in Pope's clothing, like Calixtus II or Eugenius III, might be the most effective vicegerent of God for calling to order a prince like the aggressive Emperor Henry V or a senator like the turbulent revolutionary Arnold of Brescia. If the capable and commanding nobleman were, as Eugenius was, a monk and a saint besides, so much greater the edification; but, for the service of the Holy See, the nobleman's qualities were perhaps more important; and, to judge by the prowess of Alexander III in fighting his desperate battle with Frederick I, the qualities of the lawyer were even more valuable than those of the nobleman for waging the warfare of the Church Militant. It was perhaps better still to combine the lawyer's cutting edge with the nobleman's robust self-assurance; for this was the combination of worldly gifts which triumphed, in an Innocent IV and a Clement IV, over the demonic energies of Frederick II and his offspring. If we follow our argument as far as this, however, we shall find ourselves in deep waters; for Boniface VIII was a nobly born lawyer likewise; and it was Boniface's infatuation that brought down the whole magnificent structure of the Papal *Respublica Christiana* with a crash, to lie in ruins side by side with that Holy Roman Empire which had been shattered, less than half a century back, by an Innocent's implacability. These two stiff-necked and self-confident men of the world, with their aristocratic imperiousness and their legal exactingness, did far more than the soft-hearted and incompetent Abruzzese peasant's son to destroy all that had been built up by Pope after Pope for two centuries on end upon the Hildebrandine foundations.³

¹ Calixtus II's father was the Sovereign Count of Burgundy.

² Ps. cv. 21-2.

³ 'I should not agree with the remarks about Boniface VIII. It is the old Creighton view; but compare, in criticism, Powicke's Creighton lecture, published in *History*, vol. xviii, pp. 307-29. My view would be modified by taking deeper account of the Franco-Angvin policy: i.e. I should look further back in this connexion and in others.'—Mr. G. Barraclough in a letter to the writer. Mr. Barraclough's own view of the pontificate of Innocent IV will be found in *The English Historical Review*, vol. xlix, p. 212. While the writer of this Study would be making himself ridiculous if he ventured to contest either Mr. Barraclough's or Professor Powicke's judgement in this domain, he does venture to submit that his own acceptance—for what it may be worth—of an antique judgement is perhaps not altogether unjustified on the criterion which he himself is following. The *an* incurred by Pope Boniface VIII was not, of course, the end of all things in the history of the Papacy. In administrative efficiency, for example, the Papal Curia may not

If Hildebrand himself on his death-bed could have confronted, with foreknowledge of the event, the long array of his coming successors, he would assuredly have cried out, in his Master's words, 'verily I say unto you that one of you shall betray me';¹ and the only plea that could have been offered in self-defence by a then unborn Benedetto Gaetani or Sinibaldo Fieschi would have been that his future betrayal of Hildebrand was already predetermined by Hildebrand's own betrayal of himself. Our catalogue of great Popes, from Gregory VII to Boniface VIII inclusive, proclaims that the elements of greatness which created the Papal *Respublica Christiana* were also the elements that destroyed it, and that these seeds of destruction were being sown from the outset.

The fall of the Hildebrandine Church is as extraordinary a spectacle as its rise; for all the virtues that had carried it to its zenith seem to change, as it sinks to its nadir, into their own exact antitheses. The divine institution which had been fighting and winning a battle for spiritual freedom against material force was now infected with the very evil which it had set itself to cast out from the body social of Western Christendom. The Holy See which had taken the lead in the struggle against simony now required the clergy throughout the Western World to pay their dues at a Roman receipt of custom for those ecclesiastical preferments which Rome herself had forbidden them to purchase from any local secular power.² The Roman Curia which had been the head and front of moral and intellectual progress—a tower of strength for the saints who were raising the monastic life to new heights, and for the schoolmen who were creating the universities—now turned itself into a fastness of spiritual conservatism. The ecclesiastical sovereign power in the Christian Republic now suffered itself to be deprived by its local secular underlings—the princes of the rising parochial states of Western Christendom—of the lion's share of the product of financial and administrative instruments which the Papacy itself had skilfully devised in order to make its authority effective;³ and this forfeiture of a share in the product was followed by a forfeiture

have reached its apogee until after the migration to Avignon, and the autocratic authority of the Papacy over the Church was only established in and after the pontificate of Martin V (see the present chapter, pp. 573-6, below). On the other hand the moral authority of the Papacy did, surely, never recover from the shock which it had sustained in the days of Innocent IV and Boniface VIII.

¹ Matt. xxvi. 21.

² Fees for investiture with ecclesiastical offices had, of course, always been paid to some one—i.e. to the local ordinary and his officials—before ever the controversy over investiture arose; and, moreover, the payment of a fee upon appointment was not the same thing as the purchase of an office. Yet the essence of the evil which Hildebrand was attacking was the subjection of the life of the spirit to the power of the purse; and this was an evil in which the Papal Curia itself became deeply implicated when its budget was swollen by the portentous cost of the internecine conflict with the Emperor Frederick II.

³ On this point see further pp. 539-40, below.

of the means of production as well when in England a King Henry VIII took over the Papal machinery within the frontiers of his own realm and thenceforward worked the machine with his own hands for his own profit exclusively. In the face of this final act of spoliation the Holy See found itself helpless. And as the local prince of a Papal principality the Sovereign Pontiff eventually had to content himself—like Napoleon on Elba—with the paltry consolation-prize of sovereignty over one of the least of the 'successor-states' of his own lost empire.¹ Has any other institution ever given so great occasion as this to the enemies of the Lord to blaspheme?² The downfall of the Hildebrandine Papacy is a more extreme case of *περιπέτεια* than any that we have yet encountered in our study of the nemesis of creativity. How did it happen, and why?

How it happened is foreshadowed in the first recorded transaction in Hildebrand's public career.

The creative spirits in the Roman Church who set themselves in the eleventh century to rescue our Western World from a feudal anarchy by establishing a Christian Republic then found themselves in the same dilemma as their spiritual heirs who are attempting in our day to replace an international anarchy by a political world order. The essence of their aim was to substitute a reign of spiritual authority for the reign of physical force, and in their struggle against violence the spiritual sword was the weapon with which their supreme victories were won. No physical force was exerted in Hildebrand's act of deposing and excommunicating the Emperor Henry IV; yet the moral effect of the Pope's winged words upon the hearts of the Emperor's Transalpine subjects was so intense that within a few months it brought Henry to Canossa. There were, however, other occasions on which it seemed as though the established régime of physical force was in a position to defy the strokes of the spiritual sword with impunity; and it was in such situations that the Roman Church Militant was challenged to give its answer to the Riddle of the Sphinx. Was the soldier of God to deny himself the use of any but his own spiritual arms, at the risk of seeing his advance brought to a standstill? Or was he to fight God's battle against the Devil with the adversary's own weapons, if the only practicable way of ejecting the adversary from his entrenchments was to hoist him with his own petard? Which was the true Christian act of faith? To eschew all weapons but God's, and trust in God to make David's sling prevail against Goliath's

¹ The comparison, of course, is imperfect in one vital point; for after losing his administrative and financial empire over the Western World the Pope still retained an infinitely more important spiritual empire of a kind which a Napoleon could never acquire and which even an Innocent IV could never completely destroy.

² 2 Sam. xii. 14.

536 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
panoply? Or to remind himself that the Devil and his armoury, like everything else in the Universe, were the Creator's creatures, and to believe that no created thing could remain unhallowed if it were used in the Creator's service? 'What God hath cleansed, that call not thou common'¹ was a text which might appear to support the second of these two alternative answers, and it was also a text which might seem to have been directly addressed to the Vicar of Peter.

The question presented itself in an urgent practical form to the would-be reformer Pope Gregory VI when he assumed the burden of the Papal office in A.D. 1045. In order to serve as the instrument of reform, the Holy See must be efficiently organized; to be organized, it must have money; and the necessary supplies of this material means to a spiritual end were not forthcoming; for, while the old Papal revenues from the Patrimonia Petri had disappeared with the Patrimonia themselves, the new revenues arising from the offerings of the pilgrims were being stolen from the very altar of Saint Peter's own church by the brigand-nobles of the Ducatus Romanus²—the one place in Western Christendom where the Prince of the Apostles had no honour, just because it was the country which he had made his own. No one would dispute that this sacrilegious robbery was as wicked in itself as it was damaging to the interests of the Papacy and the Christian Republic; and there was no prospect of the criminals becoming amenable to spiritual appeals or spiritual censures. The physical force which they themselves were employing was the only human agency to which they would yield. Was it justifiable to meet force with force in this flagrant case? The question was answered when the gentle Giovanni Graziano ascended the Papal throne as Gregory VI and appointed Hildebrand to be his *capellanus*; for the guardianship of Saint Peter's

¹ Acts x. 15.

² The scanty evidence in regard to the Papal finances in this age is marshalled by K. Jordan: 'Zur päpstlichen Finanzgeschichte im 11. und 12. Jahrhundert' in *Quellen und Forschungen herausgegeben vom Preussischen Historischen Institut in Rom*, vol. xxv (Rome 1933-4, Regenberg), pp. 61-104. Between the date of the Lombard irruption into Italy in A.D. 568 and that of Pope Stephen III's journey to Frankland in A.D. 753-5 the Papal Patrimonia in the form of landed estates scattered far and wide over the vast domain of the Roman Patriarchate had all been lost save for the remnant contained in the Ducatus Romanus itself; and the temporary financial relief which the Papacy had obtained in the latter part of the eighth century thanks to the donations of Pepin and Charlemagne had been more than offset, between the end of the ninth century and the middle of the eleventh, by the onset of a feudal anarchy which had diverted into alien hands the revenues of estates of which the Papacy was still nominally the owner (Jordan, op. cit., pp. 62-4). The moment of Pope Gregory VI's accession seems to have coincided with the nadir of the Papacy's finances (Jordan, op. cit., pp. 64-5). It is true that, in compensation for the lost revenues from the Papacy's own landed property, the Papal treasury was by this time already beginning to receive revenues of a new kind—dues from monasteries under Papal patronage, and Peter's Pence and tribute from kingdoms on the fringe of Western Christendom which recognized some kind of Papal overlordship (see IV. C (iii) (c) 2 (β), vol. iv, pp. 378-9, and the present chapter and volume, p. 525, footnote 4, above)—but these new sources of revenue do not appear to have yielded appreciable sums until the twelfth century (Jordan, op. cit., pp. 70-80).

altar, with the gifts that were heaped upon it, was the *capellanus*'s principal duty;¹ and Hildebrand promptly fulfilled it by raising an armed force and routing the brigands *manu militari*.

In taking this first momentous step in his career the Papal *capellanus* was making Muhammad's response to a challenge that had confronted the Arabian prophet in his native city of Mecca. Like Muhammad in Mecca in the seventh century of the Christian Era, Hildebrand in Rome in the eleventh century had to cope with the problem of performing a spiritual task in a political vacuum;² and, in support of a solution in which he was unwittingly following an Islamic precedent, Hildebrand could have quoted Christian Scripture for his purpose. He could have quoted to the brigands 'my house shall be called the house of prayer, but ye have made it a den of thieves';³ and quoted to the Pope 'the zeal of thine house hath eaten me up'.⁴ But which of the scenes in the mystery play was Hildebrand really acting? Was he playing the part of Jesus when he 'made a scourge of small cords'⁵ and 'went into the Temple of God and cast out all them that sold and bought in the Temple and overthrew the tables of the moneychangers'?⁶ Or was he doing in fact what Jesus had been falsely accused of doing when the Pharisees said 'this fellow doth not cast out devils but by Beelzebub the prince of the devils'?⁷

At the moment when Hildebrand took action the inward moral character of his act was difficult indeed to divine. At his last hour, forty years after, the answer to the riddle was already less obscure; for in A.D. 1085, when he was dying as a Pope in exile at Salerno, the more venerable city that was his see lay prostrate under the weight of an overwhelming calamity which her bishop's policy had brought upon her only the year before. In 1085 Rome had just been looted and burnt by the Normans—more ferocious brigands than any native Roman breed—whom the Pope had called in to assist him in a military struggle which had gradually spread from the steps of Saint Peter's altar, where it had started forty years before, until it had engulfed the whole of Western Christendom. The climax of the physical conflict between Hildebrand and Henry IV gave a foretaste of the deadlier and more devastating struggle which was to be fought out *à outrance* between Innocent IV and Frederick II; and by the time when we come to the pontificate of Innocent IV

¹ A general control over the Papal finances seems to have been one of the functions of the office of 'Archdeacon of the Roman Church' to which Hildebrand was subsequently appointed in A.D. 1059 (Jordan, *op. cit.*, p. 66).

⁵ John ii. 15.

⁶ Matt. xxi. 12.

⁷ Matt. xii. 24.

our doubts will be at an end. Sinibaldo Fieschi bears witness against Ildebrando Aldobrandeschi that, in choosing the alternative of meeting force by force, Hildebrand was setting the Hildebrandine Church upon a course which was to end in the victory of his adversaries the World, the Flesh, and the Devil over the City of God which he was seeking to bring down to Earth.

No Politick admitteth nor did ever admit
the teacher into confidence: nay ev'n the Church,
with hierarchy in conclave compassing to install
Saint Peter in Caesar's chair, and thereby win for men
the promises for which they had loved and worship'd Christ,
relax'd his heavenly code to stretch her temporal rule.¹

If we have succeeded in explaining how the Papacy became possessed by the demon of physical violence which it was attempting to exorcize, we have found the explanation of the other changes of Papal virtues into their opposing vices; for the substitution of the material for the spiritual sword is the fatal and fundamental change of which all the rest are corollaries.

How was it, for example, that a Holy See whose main concern with the finances of the Western clergy had been in the eleventh century the eradication of simony, should have become so deeply engaged, by the thirteenth century in allocating for the benefit of its nominees, and by the fourteenth century in taxing for its own benefit, those ecclesiastical revenues which it had once redeemed from the scandal of prostitution to secular powers for the purchase of ecclesiastical preferment? The unhappy transformation of the Papal Curia's financial role in Western Christendom was manifestly due to the ever increasing demands upon the Papal Exchequer which were being made by the perpetually recurring warfare between the Papacy and the Empire. On this point the dates speak for themselves.² A financial screw which had been given one turn when Alexander III had been at war with Frederick I, was turned again—and this time without mercy—when Gregory IX and Innocent IV were waging their more desperate warfare against Frederick II. It was the clergy of France and England who were chiefly distrained upon; for in Germany the Emperor's authority was still so far effective that it could hinder the clergy of that country from

¹ Bridges, Robert: *The Testament of Beauty* (Oxford 1929, Clarendon Press), Book IV, ll. 259-64.

² In at least one important department of Papal administration and finance, however, the apparent testimony of the dates proves to be deceptive. The institution of Papal 'provisions' grew up between the middle of the twelfth and the middle of the thirteenth century—that is to say, contemporaneously with the fighting out of the hundred years' war between the Papacy and the Hohenstaufen. Yet this development turns out neither to have taken place on the Curia's initiative nor to have worked, at this stage, to the Curia's financial profit. (On this point see Barraclough, G.: *Papal Provisions* (Oxford 1935, Blackwell), pp. 153-5.)

contributing to the war-chest of the Emperor's Papal antagonist; and in Italy—though she was the richest country in thirteenth-century Europe—the Pope found it as difficult to extract subsidies from the Italian clergy as to wring blood from a stone. In England by the middle of the thirteenth century it was being asserted that the revenue flowing out of the country to the Pope, and to the other foreign ecclesiastics who had been 'provided for' by the Pope out of English ecclesiastical resources,¹ was considerably larger than the revenue that was reaching the treasury of the King of England himself.² Both in England and in France this financial exploitation excited a resentment and provoked a restiveness which found voice in energetic protests;³ but, although Innocent IV was enough of a statesman to realize that he was placing an intolerable strain upon an invaluable loyalty, he was too hard pressed by the financial exigencies of his war to the knife with the Hohenstaufen to be able to relax his own pressure upon England and France appreciably.⁴

For this remorseless turning of the financial screw upon the provincial clergy the Roman Curia was forced in the end to pay an ironical penalty.⁵ It was compelled to surrender a share—and eventually the lion's share—of its provincial spoils to the local secular princes. While the clergy writhed under the Papal exactions and lamented the invention of the fiscal machinery through which they were put into execution, the princes merely resented the fact that this new-fangled taxing-machine, which was showing itself so admirably effective, was not at their disposal; and they set themselves, not to destroy it, but to capture it for their own benefit. The transfer of the Papal taxing-machine from the Pope's to the

¹ While the English Crown and clergy may have lost financially through Innocent IV's 'provisions' out of English ecclesiastical resources, these did not, at this date, bring the Curia any appreciable financial gain (see p. 538, footnote 2, above). The advantages derived by Innocent IV from his 'provisions' were not financial but political. They were a means of installing his own supporters in, and excluding his adversary's supporters from, a number of key-positions on the ecclesiastical map of Western Christendom. On the other hand the Papal drafts upon the revenues of the provincial churches that were levied on other accounts came in the course of the thirteenth century to play so important a part in the financial life of the Western World that firms of international bankers were formed to collect and remit them.

² Mann, *op. cit.*, vol. xiii, pp. 353-4.

³ For the protests of the English clergy to Innocent IV see Mann, *op. cit.*, vol. xiv, pp. 233-66.

⁴ 'Innocentius Papa . . . nimia duri temporis tunc eum importunitate cogente, plura, quamquam forte invitatus, fecisse dinoscitur quae ipsemet proponebat succedente opportunitate utiliter immutare.'—Pope Alexander IV, in a letter dated the 18th August, 1255 (quoted by Mann, *op. cit.*, vol. xiv, p. 299). Coming from Innocent's own successor on the morrow of Innocent's death, this discreetly expressed criticism of Innocent's policy is impressive. It has, however, to be discounted to some extent in the light of the relations between the two pontiffs here in question (see p. 531, above). In a letter to the writer of this Study Mr. G. Barraclough recalls that 'Alexander was a firm opponent of Innocent, and had been virtually "retired" during his predecessor's pontificate'. In Mr. Barraclough's judgement Alexander was moved by animus 'to attribute to Innocent many things that were more far-reaching'.

⁵ See pp. 534-5, above.

princes' hands began with the occasional concession, by the Pope to some prince, of a royalty on the Pope's own takings from the clergy in that prince's dominions—either as an inducement to the prince to facilitate the collection of the balance by the Papal agents, or in consideration of the prince's undertaking to spend his royalty, when he received it, on a crusade against the Muslims or the Hohenstaufen. As early as A.D. 1252 Pope Innocent IV and King Henry III of England were suspected of being engaged in this kind of collusion;¹ and in 1254 the Pope actually authorized the King to divert, for the conquest of the Kingdom of Sicily from the Hohenstaufen, the proceeds of a tithe which the King had been collecting from the ecclesiastical revenues of England since 1250, on the Pope's authority, for the purpose of a Crusade to the Holy Land!²

The Kings of England and France and the other countries of Western Christendom beyond the pale of the Holy Roman Empire were wiser in their generation than 'the Wonder of the World' when they turned a deaf ear to Frederick II's appeals to his peers to make common cause with him in resisting the aggression of the Papal Power against himself and his house.³ Frederick tried to frighten them into coming to his help by warning them that, if and when the Papacy did succeed in crushing the greatest of all the secular Powers in the Western body social, the monster would then have the smaller fry at its mercy and would proceed to mete the same measure to them as to the Hohenstaufen Emperor-King. The unwillingness of Frederick's brother princes to respond to his call—notwithstanding their manifest lack of enthusiasm for the cause of Frederick's Papal adversary—seems to show that they did not take the Emperor's warning very seriously⁴ and that they had a shrewder idea than Frederick professed to have, or than Gregory IX and Innocent IV can have had in fact, of what the actual consequences of this 'Punic War' between the Empire and the Papacy would be.

¹ Mann, *op. cit.*, vol. xiv, p. 258.

² *Ibid.*, p. 271.

³ Frederick made a general appeal to the other princes of Western Christendom in 1227, after his excommunication by Gregory IX, and again in 1239 after his excommunication by the same Pope for the second time (Mann, *op. cit.*, vol. xiii, pp. 217-19 and 286-7).

⁴ An advocate of Frederick's thesis would have been able to adduce some historical evidence of recent date in support of it. He could have pointed out that the war of 1159-77 between Pope Alexander III and the Emperor Frederick I had been matched, in England, by the contemporary struggle—from 1162 to 1174—between Archbishop Thomas Becket and King Henry II. In this provincial conflict between Church and State, however, the ecclesiastical combatant had proved more formidable after his martyrdom in A.D. 1170 than before it. In his lifetime Becket had not found it easy to enlist on his side either the clergy of England or the Roman Curia in a quarrel with King Henry II on what was largely a personal issue. The Pope at the time had his hands full elsewhere, and he had no desire to incur the King of England's hostility. On the other hand the Curia did not miss its opportunity of taking advantage of the crime by which the King in the end put himself hopelessly in the wrong.

The outcome was, of course, the usual outcome of a great war which is fought out to the bitter end. The nominal victor succeeded in dealing the death-blow to his authentic victim at the cost of sustaining fatal injuries himself; and the real victors over both the belligerents were the neutral *tertiū gaudentes*. When Pope Boniface VIII acted as though Frederick's forecast had been correct, and hurled against the King of France the pontifical thunderbolt with which the Emperor had been blasted by Boniface's predecessor Innocent IV, the sequel demonstrated that, as a result of the deadly struggle of A.D. 1227-68, the Papacy had sunk to the level of weakness to which it had reduced the Empire, while the Kingdom of France had become as strong as either the Papacy or the Empire had been before they had destroyed each other. In a trial of strength in which King Philip emerged unscathed by the Papal thunderbolt's blast, Pope Boniface was shown to be defenceless against the sacrilegious buffetings of a Guillaume Nogaret and a Sciarra Colonna; and Boniface's successors learnt this cruel lesson so well that they meekly came to Avignon to sit on the door-step of a new secular master who was quite as imperious as the Henrys and the Fredericks, without possessing the shadow of an Emperor's traditional title to exercise secular jurisdiction over a Pope.

The events of A.D. 1303-5 made it certain that the local secular princes would inherit, sooner or later, within their respective territories, the whole of the administrative and financial power and organization which the Papacy had been gradually establishing for itself all over Western Christendom. The process of transfer was only a matter of time. We may notice, as landmarks on the road, the passage in England of the Statute of Provisors in 1351 and the Statute of Praemunire in 1353; the concessions which the Curia was compelled to make, a century later, to the secular powers in France and Germany as the price of the abandonment of their support of the Council of Basel;¹ the Franco-Papal concordat negotiated at Bologna in 1516, in which the Roman See made an unequal division, with the French Crown, of existing Papal prerogatives in French territory, at the expense of the Gallican Church and the University of Paris; and the passage in England of the Act of Supremacy in 1534. This series of landmarks may remind us that the transfer of the medieval Papacy's prerogatives to the local secular Governments had begun, all over Western Christendom, some two hundred years before the Reformation, and that it worked itself out to its conclusion in the states which remained Catholic as well as in those which became Protestant. In both groups of states alike the sixteenth century saw the process completed; and it is,

¹ See IV. C (iii) (b) 11, pp. 217-18, above.

542 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
of course, no accident that the same century also saw the laying of the foundations upon which the 'totalitarian' parochial states of the modern Western World have been built up in the course of the last four centuries.

In earlier parts of this Study¹ we have traced the genesis of these modern parochial sovereign states of the kingdom-state calibre back to the city-states of medieval Italy. We can now see that the impact of Italian Civic Efficiency upon Transalpine Government is not the only clash of historical forces out of which our latter-day juggernauts have taken their formidable shape. A second, and perhaps equally prolific, source of the plenitude of power which these parochial sovereign states have now acquired has been the impact of their parochialism upon the Papal *Respublica Christiana*.² When the Papacy exhausted its strength in its deadly conflict with the Holy Roman Empire, it placed itself at the mercy of the parochial secular states; and it was then promptly despoiled by them of the panoply with which it had equipped itself for fighting its medieval battle. The oecumenical administrative and financial machinery through which the medieval Curia governed and taxed the provincial churches survives to-day in the corresponding apparatus of each of the parochial states of the modern Western World.³ The oecumenical system of representative councils—from the First General Council of the Lateran (A.D. 1123) to the Council of Basel (A.D. 1431-49)—through which the members and the head of the Hildebrandine body ecclesiastic periodically adjusted their relations with one another, has a counterpart, if not a relic, to-day in our parochial secular parliaments.⁴ Above all, the devotion which the provincial clergy, throughout medieval Western Christendom, once learnt to give to the Pope, as the living human head of an oecumenical society which was a mundane embodiment of the *Civitas Dei*, now

³ For the financial machinery of the medieval Papacy see Barraclough, G.: *Papal Provisions* (Oxford 1935, Blackwell); Lunt, W. E.: 'The Financial System of the Medieval Papacy' in *The Quarterly Journal of Economics*, vol. xxiii, pp. 251 seqq. (Boston 1909, Ellis); eundem: *Papal Revenues in the Middle Ages* (London 1934, Milford); Samaran, C., and Mollat, G.: *La Fiscalité Pontificale en France au XIV^e siècle* (Paris 1905, Fontemoing); Mollat, G.: *Les Papes d'Avignon* (Paris 1912, Lecoffre).

⁴ The general councils of the medieval Western Church have a Western revival of the oecumenical councils of the Catholic Church in the fourth and fifth centuries. Some of the earliest of the Western parochial secular parliaments—e.g. the parliaments convened in England in 1246 and in Apulia in 1256 and the Estates General convened in France in 1302—were summoned for the purpose of resisting an extension of the Papal prerogative. Were these parochial parliaments—in which the local clergy were at least as well represented as the local laity—inspired by the example of the general councils of the Church, on the principle of fighting the Holy See with its own weapons? The verdict of the experts appears, at the moment, to be that the main principles of conciliar and parliamentary organization and procedure are so different as to make it difficult to imagine that the ecclesiastical institution can have served as the model for the secular.

survives in the loyalty which the parochial secular 'successor-states' of the medieval Christian Republic receive to-day from their subjects without much distinction between laymen and clerics.

This hold upon human hearts is the most precious of all the spoils which the 'successor-states' have taken from the greater and nobler institution which they have plundered; for it is by commanding loyalty, far more than by raising and spending revenues or maintaining and employing armies, that these 'successor-states' have succeeded in keeping themselves alive. At the same time this spiritual heritage from the Hildebrandine Church is the element in the constitution of our modern parochial states which has turned these once harmless and useful institutions into a grave menace to the welfare of our civilization. For the spirit of devotion which was a beneficent creative power in Western Christendom when it was directed through the gates of a *Civitas Dei* towards God himself, has degenerated into a maleficent destructive force in the process of being diverted from its original divine object and being offered instead to an idol made by human hands.¹ Parochial states, as our medieval forebears knew, are man-made institutions, useful and even necessary in their place, which deserve from us that conscientious but unenthusiastic performance of a minor social duty which we render, in our time, to our municipalities and county councils. To idolize these pieces of social machinery, which have nothing divine about them, is to court a spiritual disaster; and this is the disaster towards which our modern Western World is heading to-day² as an ultimate consequence of the spiritual spoliation of the Holy See by the secular principalities which were once kept in their place by the Papacy's moral authority.

The sole, and paltry, compensation which the Papacy received from its despoilers was a tiny share in the territorial sovereignty which the local secular princes were forging for themselves out of their Papal spoils. The effective establishment of the Pope's territorial sovereignty proceeded *pari passu* with his virtual eviction from the moral presidency of an oecumenical Christian Commonwealth. In the great age of the Hildebrandine Church the Popes, as we have seen,³ were content—notwithstanding the donations of Pepin and Charlemagne and Matilda—to forgo the practical exercise of territorial sovereignty even in Rome itself. The first piece of territory over which any Pope exercised full powers of civil government *de facto* as well as *de jure* was the Venaissin—a fragment of the Burgundian portion of the heritage of the Counts of Toulouse which was ceded to Pope Gregory X by King Philip III

544 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS of France in 1274, while the Council of Lyon was in session. Ostensibly this Council—at which Rudolf of Hapsburg sought and obtained the recognition of his election as King of the Romans, and the Greeks sought and obtained their restoration to communion with Rome, on the Pope's own terms¹—was a Papal triumph which placed the coping-stone upon the Hildebrandine edifice. Actually, however, the foundations of the mighty structure had been fatally undermined before its upper-works were finished off; and the collapse of A.D. 1303-5 occurred before the Pope's territorial dominions received their next extension through the purchase of the city of Avignon by Pope Clement VI in 1348. Thereafter, between 1353 and 1367, when the republican movement in Rome had been discredited—after two centuries of licence—by the antics of Rienzi, and when civic liberties were on the wane all over Central and Northern Italy, a Spanish soldier, Cardinal Albornoz, made an effective conquest of the greater part of the Donation of Charlemagne on behalf of a Papal master who was then still hugging the golden chains of a humiliating 'Babylonish Captivity'; and at the turn of the fourteenth and fifteenth centuries, at the height of the Great Schism, Albornoz's work was repeated and confirmed by Pope Boniface IX with one hand, while with the other hand he was contending with his rival Benedict of Avignon. In the course of the next hundred years these Italian possessions of the Papacy became securely welded together into one of the ten despotically governed principalities into which the sixty or seventy medieval city-states of Central and Northern Italy were consolidated during the transition from the Medieval to the Modern Age.² In this one field the Papacy achieved, in its decline, a success which had never come its way in the period of its Hildebrandine greatness; and the achievement was not undone, or even interrupted, by a series of unprecedented disasters: the 'Babylonish Captivity' of 1309-76,³ the Great Schism of 1378-1417, the Reformation, and the Sack of Rome in 1527. The reason was that the erection of the Papal principality was an almost automatic consequence of the establishment of a new international order—or anarchy—in the Western World; and in yielding to this new dispensation, which was an utter reversal of the Hildebrandine régime, the Papacy was simply allowing itself to drift on an irresistible tide which was not, this

¹ See IV. C (iii) (c) 2 (β), Annex II, p. 616, below.

² For this process of consolidation see III. C (ii) (δ), vol. iii, pp. 354-7, above.

³ The disaster lay in the 'capture' of the Papacy by the French Crown, and not in the scene of the 'captivity'; for the metaphorical Babylon on the banks of the Rhône was much better placed than the metaphorical Zion on the banks of the Tiber for serving the fourteenth-century Papal Curia as a centre for the administration of an ecclesiastical empire which extended at the time from Sicily to Ireland and from Portugal to Finland. (On this point see p. 520, footnote 2, above.)

time, of the Papacy's own raising. The modern Papal State was one of the Machiavellian secular 'successor-states' into which the Hildebrandine ecclesiastical commonwealth was partitioned; and it lasted as long as the rest of the territorial system of which it was part and parcel—maintaining itself on the Rhône till A.D. 1791 and on the Tiber till A.D. 1870.

The consciousness that it was now drifting with the tide, and that it had lost control over its own destinies, was no doubt the psychological cause of the conservatism to which the Papacy abandoned itself from the time when it received the shock of the Protestant Reformation until the time when it began to recover from the later shock which was administered to it by the Italian *Risorgimento*. Realizing that it was now at the mercy of wind and wave, the Papacy came to see its safety in stagnation.

'When thou wast young, thou girdedst thyself and walkedst whither thou wouldest; but when thou shalt be old thou shalt stretch forth thy hands, and another shall gird thee and carry thee whither thou wouldest not.'¹

For a person or institution that has come to this pass, any change is formidable, because it will not be a change that is voluntary, and may be a change for the worse. It was in this spirit that the Papacy set its face, not only against the hierarchical and theological innovations of the Protestant Reformation, which were deliberately antagonistic to the Hildebrandine order of society, but also against some of the new discoveries of modern Western Physical Science and new ideas of modern Western Social Philosophy.

We have now perhaps found some answer to the question how the Papacy came to suffer its extraordinary *περιπέτεια*; but in describing the process we have not explained the cause. We may be justified in our thesis that the downfall of the Papacy in every sphere can be traced back to its abandonment of the spiritual in favour of the material sword, and that this fatal change can be traced, in its turn, to Hildebrand's choice in the first act of his public life. Yet, even if it were demonstrable that Hildebrand's decision in A.D. 1045 to parry force with force was the ruin of the Hildebrandine enterprise as a matter of fact, this would not prove that what did happen was bound to happen *a priori*. The single example of the Hildebrandine tragedy, impressive though it may be, can prove no more, in itself, than the truism that the use of material means towards a spiritual end is always a dangerous game. To live dangerously, however, is the inevitable condition of being alive at all; and there is no decisive evidence for the operation of a moral Gresham's Law to make it certain that, whenever

¹ John xxi. 18.

force is employed in a spiritual cause, this dangerous manœuvre will always incur defeat. There may be cases in which the same manœuvre can be resorted to with a chance of success, and some cases, perhaps, among these, in which no other line of action holds out any prospect of victory, so that there the choice will lie between risking defeat in a hazardous move and accepting defeat without a struggle. In fact, notwithstanding the experience of the Hildebrandine Church, this Riddle of the Sphinx remains inscrutable still. And in our own later generation, when we find ourselves confronted once more by Hildebrand's dilemma, with the advocates of an uncompromising pacifism arrayed *ancipiti Marte* against the advocates of enforcing peace, we cannot pronounce that Hildebrand's choice was intrinsically the wrong one simply because it resulted in a disaster in Hildebrand's case. It is therefore not enough to show how this disaster occurred; we have also to answer, if we can, the question why.

Why was it that the medieval Papacy became the slave of its own tools, and allowed itself to be betrayed, by its use of material means, into being diverted from the spiritual ends to which those means had been intended to minister? In the history of the Roman See, as in that of the Roman Republic, the explanation of an ultimate defeat is to be found (so it would seem) in the untoward effects of an initial victory. The dangerous game of fighting force with force had in these cases fatal results because, to begin with, it succeeded only too well. Intoxicated by the successes which their hazardous manœuvre obtained for them in the earlier stages of their struggle with the Holy Roman Empire, Pope Gregory VII and his successors persisted in the use of force, and carried it to extremes, until it defeated the users' purpose by becoming an end in itself. While Gregory VII fought the Empire with the object of removing an Imperial obstacle to a reform of the Church, Innocent IV fought the Empire two hundred years later with the object of breaking the Imperial Power. The downfall of the Hildebrandine Papacy was a supremely tragic performance of the drama of *κόρος-ὑβρις-ἄτη*.

We can verify the working out of this *Leitmotiv* in two ways. We can discern it in a contrast between some earlier and some later scene in the play; and we can detect it by an analysis of the plot.

The first pair of outwardly similar but inwardly diverse scenes is one in which three rival claimants to the Papacy are summoned before the judgement-seat of a council of the Church under the presidency of a Holy Roman Emperor, with the result that two of them are declared illegitimate, the third is permitted to avoid deposition by abdicating, and the Holy See thus rendered vacant is

filled in due course by the election of a new candidate. In A.D. 1046 it was Pope Gregory VI who was compelled by the Emperor Henry III to abdicate, at the Synod of Sutri, in order to make way for Suidger of Bamberg to ascend the Papal throne as Clement II; in A.D. 1415 it was Pope John XXIII who was compelled to abdicate by the Fathers of the Council of Constance, under the auspices of the Emperor Sigismund, in order that Oddone Colonna might become Pope Martin V. Externally the two scenes might seem almost indistinguishable, but there is a difference in *ethos* between the two protagonists which gives some measure of the moral disaster to which the Papacy had succumbed in the course of the four intervening centuries. Pope Gregory VI was an unworldly saint who had rendered himself technically guilty of the offence of Simony by purchasing the Papal office, with money legitimately acquired, in order to rescue it from the hands of his unworthy god-son, Pope Benedict IX. The offence had been so strictly formal, and the motive so plainly pure, that John Gratian's action had been acclaimed by Peter Damian as the salvation of the Church, while Hildebrand showed his opinion of it by taking service under his old schoolmaster as his *capellanus* and assuming this master's pontifical name when his own turn came, long afterwards, to ascend the Papal throne as Gregory VII. The condemnation of Gregory VI was a travesty of justice which aroused indignation all over Western Christendom and inspired Hildebrand¹ to devote his life to fighting for the liberation of the Church from an arbitrary 'Caesaro-papism'. Yet the victim of this judicial act of injustice accepted and endorsed the sentence without a murmur. Not so the condottiere Baldassare Cossa, 'the most profligate of Mankind',² whom the Council of Constance had to deal with as Pope John XXIII. 'He fled, and was brought back a prisoner; the most scandalous charges were suppressed; the Vicar of Christ was only accused of piracy, murder, rape, sodomy, and incest; and, after subscribing his own condemnation, he expiated in prison the imprudence of trusting his person to a free city beyond the Alps.'³ The poison of worldliness had worked potently in the course of less than four hundred years to produce the contrast between this scene and that.

There is another pair of scenes in which a Pope invades Southern Italy with an armed force, meets with an ignominious defeat from

¹ See pp. 512-13, above.

² Gibbon, E.: *The History of the Decline and Fall of the Roman Empire*, ch. lxx.

³ Gibbon, op. cit., cap. cit. Since the date at which Gibbon wrote these demurely deadly sentences, a substantial summary of the evidence against John XXIII has come to light (see Waugh, W. T., in *The Cambridge Medieval History*, vol. viii (Cambridge 1936, University Press), p. 7, footnote 2). The reason why 'the most scandalous charges were suppressed' is still, however, unknown (op. cit., p. 8, footnote 1).

the Power whom he is attacking, and dies of chagrin. In the first scene it is Pope Leo IX who is defeated in 1053 by the Normans;¹ in the second scene it is Pope Innocent IV who is defeated in 1254 by Manfred. Outwardly the *ci-devant* Bruno of Egisheim was more deeply humiliated than the *ci-devant* Sinibaldo Fieschi; for he led his army in person, was taken prisoner on the battle-field, and died in virtual captivity, while his more prudent successor two hundred years later assigned the command of his army to his nephew and died a free man. The difference, however, is all the other way when we take account of motives and states of mind. Pope Leo was attempting, in co-operation with the secular arm of the Emperors of both East and West, to carry out a police operation against a band of brigands whom their victims spoke of not as Normans but as Hagarenes, to signify that they were the truceless enemies of Church and State. Yet, even in so good a cause, this nobleman's son who had been brought up among men of war was filled with compunction at the thought that he had lent the countenance of his Papal office to the shedding of blood;² and what broke his heart was the slaughter of his followers and not his own defeat and capture by the outlaws whom he had hoped to subdue. Innocent, on the other hand, was on the war-path against the son of a dead and defeated enemy against whom he nursed such an implacable hatred³ that he must needs pursue his vendetta into the second and the third generation. The chagrin that killed him was his rage at being foiled in an attempt to carry the war into the enemy's country and to chey out of his father's ancestral kingdom a prince who had abandoned his father's aggressive ambitions and who was only anxious to be left in peace.⁴ Militarily, Innocent's and Leo's Apulian expeditions ended in much the same way, but morally there is no comparison between them; and this moral gulf gives the measure of the Papacy's spiritual degeneration during the intervening span of two hundred years.

Yet another pair of scenes whose likeness and difference tell the same tale of a moral decline and fall is a pair which offers the outwardly identic spectacle of a Pope being kidnapped and brutally handled by men of violence with the cold-blooded intention of

¹ See IV. C (iii) (c) 2 (β), Annex II, pp. 611-12, below.

² Herein Bruno's temperament presents an instructive contrast to that of his adviser, and eventual successor, Hildebrand.

³ In substitution for the words 'implacable hatred' Mr. G. Barraclough suggests the phrase 'consistent policy based on a conviction of the impossibility of co-operation with the Hohenstaufen, and of the danger of their presence in Italy'.

⁴ This statement of Manfred's attitude and intentions is, in Mr. Barraclough's submission, 'beside the point from Innocent's point of view, just as Hitlerian protestations of goodwill and peacefulness are beside the point for France to-day'. In the opinion of the writer of this Study Mr. Barraclough's striking parallel damns Poincaré-la-Guerre without exculpating Sinibaldo Fieschi.

breaking his nerve and so bringing him to make a great concession which he would never have conceded on its merits. In the first of these two scenes we see Pope Paschal II being seized in A.D. 1111 by the Emperor Henry V at the high altar of St. Peter's and carried away captive into the Campagna; in the second we see Pope Boniface VIII being assaulted at Anagni in A.D. 1303 by Guillaume Nogaret and Sciarra Colonna. The purpose of Henry V was to extort from Pope Paschal an acknowledgement of the Emperor's right to confer Investiture; the purpose of Guillaume Nogaret was to extort from Pope Boniface a retraction of certain bulls which the Pope had promulgated against Nogaret's royal master. To this extent the two scenes are in conformity; it is when we consider the respective antecedents of this pair of outrages against the Pope's sacrosanctity that the moral difference comes to light. Behind Nogaret's brutal assault upon Boniface there was no treachery and much provocation. For nearly two years past the Pope had been conducting against the King of France an ever more violent war of words, with the evident intention of coercing the King into a public submission and thereby leading him in triumph as a royal captive of the pontifical bow and spear. The first shots had been fired in *Clericis laicos* and *Ineffabilis amoris*. *Salvator mundi* and *Ausculata fili* had been followed up by *Unam sanctam*—a bull which roundly asserted the supremacy of the pontifical over the secular sword—and *Unam sanctam* by *Super Petri solio*, a bull in which the King was excommunicated. In raising the question of swords, Boniface had been 'asking for trouble'; and, when he gets it, we cannot feel that the coin of violence in which Nogaret pays him is very different from the Pope's own mintage. On the other hand the antecedents of Henry's brutal assault upon Paschal were such as to leave the Emperor altogether without excuse. On that very morning, and in those very precincts, he had just concluded with his victim a concordat¹ in which he had renounced the very claim which he now compelled the Pope to concede under physical duress; and he had renounced it in exchange for a renunciation of equal magnitude on Paschal's part. The agreement was that, in consideration of Henry's abandonment of a claim to confer Investiture upon ecclesiastics, the Church should surrender all the *regalia*—the powers and rights and revenues of a secular order—which it had acquired in the course of ages, and should content itself with the proceeds of its tithes and free-will offerings. If this agreement had been ratified and carried out, it would have achieved a radical settlement of

¹ Henry's assent does, it is true, appear to have been given subject to the condition that the agreement should be ratified 'firma et autentica ratione, consilio quoque vel concordia totius ecclesiae ac regni principum assensu' (Carlyle, *op. cit.*, vol. iv, p. 116, quoting Ekkehard's *Chronicle sub A.D. 1111*).

550 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
the question over which the Empire and the Papacy were then at issue; and Henry's failure to ratify was not Pope Paschal's fault. Henry failed because he could not carry with him the bishops of Germany, who did not care to obtain their liberation from Lay Investiture if the sacrifice of their *regalia* was to be the price; and, having failed, he not only went back upon his bargain but determined to extort a recognition of his previous claim by committing an act of the grossest treachery and violence. If Boniface largely deserved what he got, Pope Paschal assuredly did not.

Finally we may contrast the spectacle of Pope Celestine V making his 'Great Refusal' in A.D. 1294 with the spectacle of that other 'harmless old man' who 'was left in a solitary castle to excommunicate twice each day the rebel kingdoms which had deserted his cause',¹ and who persisted in this exercise from his deposition in 1417 until his death in 1422/3. If the approach of moral decay is foreshadowed in Celestine's pathological flight from responsibility,² its advent is proclaimed in Benedict's pathological clinging to power. In either gesture there is that note of exaggeration which is one of the surest symptoms of moral as well as physical misgrowth.³ The exaggeration runs to the length of caricature; and in either case it is the caricature of an element which is to be found in the character of other Popes of very different spiritual stature. In the soul of each of those spiritual giants the conflicting impulses to which a Celestine and a Benedict respectively gave way had both been perpetually present, and therefore perpetually at war, without ever overriding a will which was able to keep them both in order because it was stronger than either of them. A Gregory VII or a Gregory I had been tormented by the burden of the Papal office because he had all the time been aware of an Other World from which the cares of This World were keeping him in exile; yet he had carried the burden indomitably to his journey's end because he had divined that his duty lay in This World so long as he was a sojourner in it, and that only 'he that endureth to the end shall be saved'.⁴ This ceaseless struggle between conflicting impulses under a higher control—this inward spiritual warfare which wrings from the titan's breast the cry 'O wretched man that I am!'⁵—is the well-spring of Hildebrandine lives and achievements. When we pass from a Hildebrand to a Celestine and a Benedict, and see in them the same creative impulses deprived of all their virtue

¹ Gibbon, *op. cit.*, cap. cit.

² 'A historian might argue that his renunciation was the only sensible thing that Morrone did as Pope—it was not the "flight from responsibility" that was questionable, but the weakness of will that led to its acceptance, and the stupidity of the policy of the cardinals who made the election.'—Mr. G. Barraclough, in a letter to the writer.

³ On this point see IV. C (iii) (c) 2 (γ), Annex, below.

⁴ Matt. x. 22.

⁵ Rom. vii. 24.

by a fatal divorce from one another and an equally fatal breakage of their bond of spiritual discipline, we perceive that the end of the Hildebrandine order is at hand.

The operation of *κόρος-ὑβρις-ἄτη* which we have detected in these comparisons of successive pairs of scenes is revealed still more clearly when we take the play as a whole and analyse the plot.

The first act opens in A.D. 1046 with a challenge to the Roman See which is taken to heart by Hildebrand.

In Hildebrand's generation the Western Christendom was passing out of the first into the second chapter of its history—out of a defensive state of mind in which the height of ambition was to keep alive, as the Abbé Siéyès boasted in a later age that he had lived through the French Revolution, into an adventurous state of mind in which this vegetative life for life's sake began to seem hardly worth living unless it could now be transcended, on the Aristotelian scheme of social growth,¹ in an effort to make life a stepping-stone towards attaining the true end of Man. This troubling of the waters of Western life in the eleventh century of the Christian Era revealed itself most powerfully in a mighty movement for reforming the conduct of the Church,² which in that age was another name for the Western Society itself; and this movement presented a challenge to the Roman See because, in the relations between the Papacy and the Western body social, it made it impossible for the *status quo ante* to persist. It was only in a society that was numb with misery—as Western Christendom had been from the twilight of Charlemagne's generation to the dawn of Otto the Great's—that the prerogative of moral leadership could be left, even nominally, in the hands of an institution which was disgracing itself as the Roman See disgraced itself during that profligate passage in its history. From the moment when the Western World as a whole began to shake off its moral torpor and aspire to a better life, the Roman See was confronted with the alternative of leaping at one bound from the lowest to the highest rung of the moral ladder as it stood in that age, or else being pilloried in its actual state of degradation and seeing its kingdom numbered and finished and divided and given to the Medes and Persians.³ There was a danger-signal for discerning eyes in the Lateran in the tremor of indignation which ran through Western Christendom—

¹ Aristotle: *Politics*, Book 1, chap. 2, § 8 (p. 1252 B): *τέλειος πόλις . . . γνωμένη μὲν οὖν τοῦ ζῆν ἔνεκεν, οὐσα δὲ τοῦ εὖ ζῆν.*

² In the eleventh century 'la renaissance de la richesse, l'essor des nations, la vigueur des états permet à l'Eglise d'abandonner les tâches dont la défaillance de l'Empire Romain l'a peu à peu chargée, et de se consacrer toute à sa mission spirituelle, à son œuvre édicatrice.'—Dufourcq, A., *op. cit.*, vol. vi, 4th edition, p. 2. Compare Carlyle, *op. cit.*, vol. iv, pp. 49-51 and 58-60.

³ Dan. v. 25-8.

552 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
 and with particular vehemence in the Transalpine parts—when it was reported in 1024 that the Greeks were in negotiation with the Papacy for the purchase of Papal acquiescence in the Patriarch of Constantinople's long-maintained and long-contested pretension to the title of 'Oecumenical'.¹ This explosion of anger at an only too credible rumour that the Pope was selling his birthright for a mess of pottage showed that the profligacy of the Roman See was notorious and odious to the Western *Plebs Christiana*. And when, a score of years later, the Papal *capellanus* Hildebrand, in whose own soul the spirit of the age was working, saw an Emperor conduct the trial and procure the condemnation of a Pope on a charge of Simony, he read the meaning of this writing on the wall and went into action. In that hour Hildebrand set himself the tremendous task of reversing the judgement upon the Roman See which had just been pronounced at Sutri; and in thirty years of titanic labour he succeeded in achieving the impossible. By 1075 the double battle against the sexual and the financial corruption of the clergy had been won throughout the Western World, and the victory had been gained by the moral prowess of a Roman See whose profligacy had been the greatest of all the scandals of the Western Church in the preceding century. This victory had been Hildebrand's personal work. He had fought for it beyond the Alps and behind the Papal Throne until the fight had carried him at last into the office which he had raised from the dust; and he had fought with every weapon, spiritual or material, that had come to his hand. It was at the moment of triumph, in the third year of his reign as Pope Gregory VII, that Hildebrand took a step which his champions can plausibly represent as having been almost inevitable² and his critics—no less plausibly—as having been almost inevitably disastrous.³ In that year Hildebrand extended his field of battle from the sure ground of Concubinage and Simony to the debatable ground of Investiture.

Logically, perhaps, the conflict over Investiture might be justified as an inevitable sequel to the conflicts over Concubinage and

¹ For the controversy over this title see IV. C (iii) (c) 2 (β), p. 333, above.

² 'Inevitable' has to be qualified by 'almost', considering that in the view of the leaders of the Cluniac movement the domestic moral reform of the Church by her own efforts, which Cluny had initiated, was not impossible to carry through without undertaking the second and still more formidable task of recovering the Church's freedom from external control by liberating her from lay influence. In the Cluniac view the two issues were not inseparable, and therefore Cluny parted company with the Roman Curia when the battle over Investiture was engaged by Hildebrand.

³ Hildebrand possesses in common with another militantly idealistic religious innovator, Ikhnaton, an apparently perennial capacity for arousing passionate feelings, whether of devotion or of hostility, in the hearts of all who cross his path in *saecula saeculorum*. The controversy that rages over the characters and careers of these two great men among the scholars of our own generation is conducted with at least a touch of the animus which was displayed by Hildebrand's and Ikhnaton's own respective contemporaries.

Simony if all three struggles were looked upon as aspects of one single struggle for the liberation of the Church. To a Hildebrand at this critical point in his career it might almost seem labour lost to have freed the Church from her servitude to Venus and to Mammon, if he were to leave her still fettered by her political subjection to the Secular Power. So long as this third shackle lay heavy upon her, would she not still be debarred from doing her divinely appointed work for the regeneration of Mankind? This argument on the lips of the apologists for Hildebrand's new departure in the year 1075 begs a question which Hildebrand's critics are entitled to ask, even if they fail to prove conclusively that the answer to it is in their own favour. In A.D. 1075, were the circumstances such that any clear-sighted and strong-minded occupant of the Papal throne was bound to judge that there was no longer any possibility of sincere and fruitful co-operation between the reforming party in the Western Church, as represented by the Roman Curia, and the Secular Power in the Western Christian Commonwealth, as represented by the Holy Roman Empire? On this question the onus of proof lies with the Hildebrandines on at least two accounts.

In the first place neither Hildebrand himself nor his partisans ever sought—either before or after the promulgation of Hildebrand's decree prohibiting Lay Investiture in 1075—to deny that the secular authorities had a legitimate role to play in the procedure for the election of the clerical officers of the Church from the Pope himself downwards.¹ In the second place, within the thirty years ending in 1075 the Roman See had been working hand in hand with the Holy Roman Empire in the older conflict over the issues of Concubinage and Simony. Indeed, their co-operation had become so sincere and so cordial that the Emperor Henry III, who had forced Pope Gregory VI out of office and into exile in 1046, chose Pope Victor II ten years later, when the Emperor was on his death-bed, to be the guardian of his six-years-old son.² It is true that, in the domain of the Empire, if not in the Western World as a whole, Henry III's premature death in A.D. 1056 had been followed by a moral relapse—especially in the matter of Simony—which had begun during the minority of Henry III's namesake and son and successor Henry IV and had not ceased when the young prince had taken over the reins of government himself in A.D. 1069.³ In fact, 'behind any particular occasions of difference there lay a more general cause, and this was the fact that after the death of Henry III

¹ On this point see Carlyle, *op. cit.*, vol. iv, Part I, chs. 2 and 3, and Part II, *passim*, especially ch. 2.

² For the friendliness of the Emperor Henry III's relations with the reform party in the Curia after, as well as before, A.D. 1046 see p. 512, footnote 4, above.

³ See Carlyle, *op. cit.*, vol. iv, pp. 55, 61-2, and 170-1.

the temporal authority was no longer co-operating with the spiritual in the attempt at reform, but seemed rather to be responsible for the continuance of grave evils, such as Simony and the secularization of the clergy. It was under these circumstances that the Papacy began to develop the policy of limiting or prohibiting the intervention of the secular authority in ecclesiastical appointments. This may have been justifiable and even necessary, but it must be admitted that it was a step of an almost revolutionary character;¹ and if, in spite of all justifications and provocations, Hildebrand had foreborne to throw down the gauntlet in A.D. 1075, it is conceivable that the relations of the Emperor Henry IV with Pope Gregory might have ended in being not less happy than his father's relations with Pope Victor.

To raise the new issue of Investiture with a militancy which was bound to set Empire and Papacy at variance was the more hazardous inasmuch as this third issue happened to be far less clear than those others on which the two authorities in Western Christendom had, not so long since, seen eye to eye.

One source of ambiguity arose from the fact that, by Hildebrand's day, it had become established that the appointment of a clerical officer of episcopal rank required, in order to make it valid, the concurrence of several different parties in taking action of several different kinds. It was one of the primeval rules of ecclesiastical discipline that a bishop must be elected by the clergy and people of his see and must be consecrated by a quorum of the validly consecrated bishops of the province. And the secular power had never at any time—since the issue had been raised by the conversion of Constantine—attempted to usurp the ritual prerogative of the bishops or to challenge, at any rate in theory, the electoral rights of the clergy and people. The role which the secular authorities had exercised *de facto*—without prejudice to the question of what the situation might be *de jure*—was that of nominating candidates and wielding a power of veto over elections; and this power, which was grounded in Roman Imperial practice, had been successfully reasserted in the West by the Holy Roman Emperors Charlemagne and Otto I, in anticipation of Henry III, against the Papacy itself, which was the highest ecclesiastical office in the Western World. There may be some uncertainty about the scope of the powers which, on the morrow of the Synod of Sutri, were conferred upon Henry as *patricius* by the Roman clergy and people; but it is certain that the first step in the making of a Pope Leo IX out of a Bruno Bishop of Toul, and of a Pope Victor II out of a Gebhard Bishop of Eichstett, was the despatch of a diplomatic

¹ Carlyle, *op. cit.*, vol. iv, p. 66.

mission across the Alps from Rome to the Emperor to ask for an Imperial nomination; and in the second of these instances the Roman mission came with Hildebrand at its head. Even as late as the year 1059, after Henry's death, Hildebrand took care to obtain the assent of the Empress Regent before he gave his own support to the candidature of Gerard Bishop of Florence; and at the famous Lateran Council which was held in the same year by Hildebrand's candidate after he had been duly elected to be Pope Nicholas II, when the Fathers laid down a procedure for Papal elections in the future, the Emperor's rights in the matter were once again formally acknowledged, even though they were left undefined. If the traditional role of the Secular Power in the appointment of the highest ecclesiastical dignitary in the West was as substantial as this, the case for the exercise of a corresponding lay influence over the appointment of ordinary bishops and abbots might almost be taken as proven *a fortiori*, and it is not certain that the legitimacy of this influence, within its traditional limits, was disputed by Hildebrand even after the promulgation of the decree of 1075.¹

This uncertainty arises out of a second ambiguity which is of a verbal order and which 'runs through the whole literature of the subject'.² The word 'Investiture' is ambiguous in itself. It may be used in the general meaning of appointment, or in the technical meaning of the bestowal of the pastoral staff and ring. And an opponent of Lay Investiture may be opposing the practice in this narrow technical sense without necessarily at the same time seeking to exclude the secular authorities from influencing appointments to clerical offices in the traditional ways.

By the eleventh century the traditional case for the exercise of some degree of secular control over clerical appointments had been reinforced by a new consideration of a practical kind which likewise applied to the lower ranks as well as to the apex of the Western hierarchy and which introduced yet a third ambiguity into an already complicated problem. This third ambiguity lay in the matter of the clergy's functions. The 'Caesaro-papistical' thesis³ manifestly gains in strength if the clergy over whom the secular power claims to exercise control become possessed, on their part, of secular as well as ecclesiastical emoluments and authority; and this had actually been happening all over Western Christendom during the three centuries ending in the reign of the Emperor Henry III. The donations of Pepin and Charlemagne to the Papacy

¹ For the evidence on this head see Carlyle, *op. cit.*, vol. iv, pp. 69-72.

² Carlyle, *op. cit.*, vol. iv, p. 74.

³ For the nature of 'Caesaro-papism' see IV. C (iii) (c) 2 (β), pp. 346-53, above.

556 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
were merely the classical examples of a wide-spread transfer, into clerical hands, of the civil power's *regalia*; and this oecumenical secular movement had been at no time so active as during the two centuries between the death of Charlemagne and the birth of Hildebrand. By the year 1075, when Hildebrand launched his campaign against the Lay Investiture of clerics, a very large part of the civil administration of Western Christendom was in the hands of clerics who held it as of feudal right, so that the exemption of the clergy from Lay Investiture in the broader sense would now carry with it an abrogation of the Secular Power's authority over large tracts of its own proper field and a transformation of the Church into a civil as well as an ecclesiastical *imperium in imperio*.¹ To demand this—if Hildebrand did unequivocally demand so much—was to declare war; and, if we ask ourselves what can have led so great a man as Hildebrand to take so grave a step, the most convincing answer will be that his judgement was clouded on this critical occasion by the intoxicating consciousness of his previous triumphs.² 'All things are possible to him that believeth'³ is a dangerous text for a human being to act upon, even when the man is a Gregory VII.

The gravity of Hildebrand's action in 1075 is revealed by the dimensions of the catastrophe which was its sequel. On this issue

¹ It will be seen that this awkward logical consequence (on one interpretation of the term 'Investiture') of Hildebrand's declaration of war upon Lay Investiture in A.D. 1075 was the inverse of the equally awkward logical consequence of the Orthodox Church's conversion of the Khan of Bulgaria in A.D. 864-5. Under the then prevailing East Roman régime of 'Caesaro-papism' the Khan of Bulgaria was, as we have seen (in IV. C (iii) (c) 2 (β), pp. 379-81, above), implicitly placing himself under the secular sovereignty of the East Roman Emperor in the act of submitting himself to the ecclesiastical authority of the East Roman Emperor's civil servant the Oecumenical Patriarch. Conversely, Hildebrand in 1075 was implicitly claiming, for the Pope and other prelates of the Western Church, a secular independence of, in addition to an ecclesiastical authority over, the Holy Roman Emperor and other secular princes of Western Christendom. In the West in the eleventh century a new idea was colliding with old facts, whereas in Orthodox Christendom in the ninth century an old idea had collided with new facts. But, notwithstanding these antitheses, the two collisions had the identical effect of precipitating a disastrous conflict.

² A hostile critic might perhaps prefer to vindicate Hildebrand's judgement, at the expense of his character, by suggesting that he had never forgiven the Emperor Henry III for having humiliated the Papacy in the person of Hildebrand's own revered master Gregory VI; that in 1075 he at last took a revenge to which he had been looking forward for thirty years; and that he had waited to spring until his redoubtable enemy had been succeeded by an inexperienced son, and until the young man had his hands full with the insurrection that had broken out in Saxony in 1073 almost at the moment of Hildebrand's own accession to the Papacy. No doubt Henry IV's Saxon troubles did influence Hildebrand's choice of his moment for striking; for so great a man of action as Hildebrand was could not be blind to such considerations, and the Saxons did in fact become his close allies in the struggle against a common enemy. Yet a Machiavellian picture of Hildebrand is unconvincing. If he was really nursing his revenge throughout those thirty years, why did he not induce one of his three predecessors on the Papal throne, who were all under his influence, to strike at the Salian Dynasty before Henry IV came of age? He did not think of it because his mind was set in a larger mould and was intent on nobler things than paying off old scores. Canossa was not just a *riposte* to Sutri in Hildebrand's mind, though to smaller minds than his it might assume that appearance in historical perspective.

³ Mark ix. 23.

of Investiture Hildebrand staked the whole of the moral prestige which he had won for the Papacy in thirty years; and his hold upon the consciences of the *Plebs Christiana* in Henry IV's Transalpine dominions was strong enough, in conjunction with the strength of Saxon arms, to bring the Emperor to Canossa. Yet, although Canossa may have dealt the Imperial dignity a blow from which it perhaps never quite recovered,¹ the sequel to that moral triumph was not an end, but a resumption, of the struggle which Hildebrand had let loose two years before. The end was not brought even by Paschal II's fundamental but abortive settlement with Henry IV's son and namesake in 1111, nor again by Calixtus II's successful but superficial settlement with the same Emperor in 1122; for, although the question of Investiture was officially disposed of by the Concordat of Worms, those fifty years of conflict had produced a rift between the Papacy and the Empire which might perhaps be precariously bridged but which was now too wide to be closed and too deep to be filled. When a Frederick I succeeded to the heritage of the Henrys and was armed, by Bolognese doctors of the disinterred *Corpus Juris*, with a Justinianean conception of the Imperial prerogative to match the Hildebrandine conception of the Apostolic power, the unhealed wound in the Western body social broke open again, and the new Justinian's battle with an ineffective Hadrian IV and an indomitable Alexander III reproduced the battle that had been fought by his predecessor Henry V with a saintly Paschal and a masterful Calixtus. The fire which Hildebrand had kindled in 1075 was still burning fiercely a hundred years later.

The second act in the tragedy opens with a respite which coincided in time with the pontificate of Pope Innocent III (*fungebatur* A.D. 1198-1216).

This precious breathing-space had not been secured by the labours of the young man who ascended the Papal throne in 1198 at the age of thirty-seven. In so far as it was due to statesmanship, the credit belonged to Innocent's predecessors Alexander III and Lucius III, the respective Papal negotiators of the Peace of Venice (1177) and the Peace of Constance (1183). Statesmanship, however, had done less for Innocent than the Chance which had drowned Barbarossa in Calycadnus in 1190 and had then carried off his formidable son and successor Henry VI only seven years later, in the very year before Innocent's own accession. These two premature deaths in rapid sequence left the House of Hohenstaufen

¹ 'Had all other humiliation been spared, that one scene in the yard of Matilda's castle . . . was enough to mark a decisive change and inflict an irretrievable disgrace on the crown so abused. Its wearer could no more, with the same lofty confidence, claim to be the highest power on Earth, created by and answerable to God alone. Gregory had extorted the recognition of that absolute superiority of the spiritual dominion which he was wont to assert so sternly.'—Bryce, James: *The Holy Roman Empire*, ch. 10.

without a competent grown man to defend its interests; and the double accident might seem providentially designed to nullify the effects of the Hannibal-stroke by which Henry VI in 1194 had reaped the fruits of a political marriage which his father had arranged, and had offset the loss of Lombardy by the acquisition of Sicily. In 1198 the two crowns—Sicilian and Imperial—which Henry VI had succeeded in uniting were once again on different heads; and although both the wearers were still Hohenstaufen they were in no position to act together against the Holy See because they were both of them politically paralysed: the King of Sicily, Henry's son Frederick II, by his tender age, and the Emperor, Henry's brother Philip, by the rivalry of a *Gegenkaiser* belonging to the rival German house of Welf. With Germany torn in two by civil war, and with the child-king of Sicily under Innocent's own guardianship, the young Pope had his hands free to play the part of President of the Christian Republic as Hildebrand had conceived it; and Innocent III did duly become the Solomon or Suleymān the Magnificent or Hārūn-ar-Rashīd of the Hildebrandine Papacy.¹

This was a brilliant role, and it was impressively sustained by a noble figure; but, if there is any substance in the analogies by which we have just described it, Innocent's pontificate was not so triumphant in reality as it appeared to be on the surface. The three secular potentates with whom we have compared this prince of the Roman Church were all of them spoilt children of Fortune who had entered into other men's labours—Solomon into David's, Suleymān into Selīm's, and Harūn into As-Saffāh's—and all of them, again, were lordly spendthrifts who ran through their own inheritance and left a reckoning to be paid by their successors. This is the company to which Innocent III belongs. As a man of action—and it is as this that he stands or falls—he is unquestionably noble; yet this nobility is tarnished by a touch of *ὕβρις* and balked by a grain of obtuseness.

The fallibility of Innocent's judgement is revealed in his handling of the weapon of the crusade; in his dealings with the Empire and the Hohenstaufen; and in his attitude towards the greatest man of his generation, Saint Francis.²

His first act after his accession was to preach a crusade for the rescue of the remnants of the Frankish principalities in Syria from the clutches of the Ayyubid Power; and this enterprise went grievously awry. Though the outposts of Western Christendom

¹ For the Solomons on the thrones of universal states who sun themselves in the fleeting warmth of 'Indian Summers', see V. C (ii) (a), vol. vi, pp. 191-6, below.

² For the connexion between the first and the third of these three points see IV. C (iii) (c) 3 (β), Annex, below.

in the Holy Land were now in desperate straits, the rescue-party which set out, at Innocent's call, upon the Fourth Crusade were successfully diverted, by deft turns of a Venetian financial screw, to the irrelevant and nefarious work of fighting their fellow-Christians—first as mercenaries and then as adventurers on their own account. While the sack of Zara was being followed by the first and the second sack of Constantinople and the partition of the East Roman Empire among the buccaneers, the Pope was first cajoled and then deceived and eventually confronted with a *fait accompli* by the ruffians who had gone upon the war-path on his authority. In this painful pass Innocent's idealism was displayed in his distress at a scandalous betrayal of the honour of Western Christendom, his largeness of mind in his concern for the fate of a Christian community who in his eyes were schismatics, and his fineness of conscience in his insistence that the conquered Greeks were not to be coerced into union with the Roman Church. But these evidences of a noble spirit increase our wonder at seeing him, only four years after the lesson of 1204, deliberately launching another assault of Christians upon Christians, and this time not even on the alien soil of Orthodox Christendom, but in Languedoc, at the heart of his own Western Christian Commonwealth.¹ Did the Pope who had deplored the horrors of the sack of Constantinople by French crusaders imagine that his Frenchmen would behave less brutally, or show themselves less mercenary or less rapacious, if they were let loose upon one of the richest provinces of the Western *Respublica Christiana*, when this time, instead of being put upon their defence for the crime of having played truant, the crusaders could justify their actions by quoting the Pope's own mandate? Did Innocent suppose that he would succeed any better this time than before in controlling the fearful forces of violence and wickedness that he was letting loose? And when he had failed to prevent a crusade against the Muslims of Syria from being diverted to the conquest of the Christians of Romania, did he seriously expect that he could manage to divert to the conquest of

¹ Innocent's policy towards the Albigenses has been touched upon already in IV. C (iii) (c) 2 (β), p. 369, above. So blind does Innocent appear to have been to the lesson of the Fourth Crusade that he actually made his first approaches to King Philip Augustus—with a view to the armed intervention of the French Crown against the heretics in Languedoc—in May 1204 and February 1205, when the miscarriage of the Fourth Crusade was in the act of taking place. Moreover he renewed these overtures in November 1207. It is true that he did not excommunicate Count Raymond of Toulouse, or absolve his vassals from their allegiance to him, until after the murder of Peter of Castelnau in January 1208; but he had been persistently playing with fire for some four years before he finally threw the lighted match into the powder magazine. In this lurid light it is difficult to excuse Innocent's recourse to the sword in dealing with intransigent Cathars, even if it is possible to explain it as the negative side of a policy which revealed its positive side in Innocent's acquiescence in the Dominican and Franciscan movements. (For the two sides of Innocent III's policy towards Catharism see IV. C (iii) (c) 3 (β), Annex, below.)

560 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
the Muslims of the Iberian Peninsula a crusade which he himself had directed against the Christians of Languedoc? Innocent appears to have been not only just as unhappy and just as helpless but also just as much surprised when his crusaders ran amok the second time as he had been on the first occasion; and it is this surprise that astonishes an observer to whom it can only seem a matter of course that the repetition of an act should be followed by a recurrence of the previous consequences.

This vein of ineptitude which comes out in Innocent's handling of his crusades is also apparent when he is dealing with the affairs of the Empire and the House of Hohenstaufen. Finding, at his accession, the Imperial Crown in dispute between a Hohenstaufen candidate and a Welf, he threw all the influence of the Holy See into the anti-Hohenstaufen scale without being able to prevent Philip of Swabia from holding his own against Otto of Brunswick for ten years. The Pope's action defeated its own aim by alienating a number of Otto's partisans in Germany whose desire to secure the triumph of their own candidate for the Crown was overborne by their unwillingness to see the traditional prerogative of the Transalpine Electors usurped by the Roman Curia.¹ In the end it was not Innocent's moral authority but an assassin's crime that removed Philip from the German arena; and even then, when Chance had intervened in Innocent's favour once more, he made nothing of her gift. The Welf candidate whom Innocent had been supporting for a decade immediately disappointed his Papal benefactor's long-cherished expectations. As soon as his rival's death set him free to descend upon Italy and receive the Imperial Crown from the Pope's willing hands, he showed himself as aggressive as any of his Hohenstaufen or Salian predecessors in asserting his Imperial pretensions. The two allies fell out; and Innocent's only reward for the pains which he had taken to raise the Welf emperor up was the trouble of having to cast him down again. In addressing himself to this thankless task, Innocent made the traditional series of moves in the traditional order. First he excommunicated Otto; then he declared him deposed; as a third step he launched against him a rival claimant to the Imperial Crown; and when he came, at last, to this Papal *ultima ratio* for bringing a recalcitrant emperor to book, he could think of no more original plan than to enlist a Hohenstaufen to overthrow the Welf whom he had previously brought into power in order to overthrow a Hohenstaufen. In thus supporting a Hohenstaufen candidature to the Imperial Crown, Innocent not only reversed what had been his own policy and the policy of his predecessors for more than seventy years

¹ See Carlyle, *op. cit.*, vol. v, pp. 207-14.

past; he actually selected for his candidate, among the members of the Hohenstaufen House, a boy who already wore the Sicilian Crown, and who would therefore be in a position to execute his father Henry's design of taking the Roman See between two fires if Innocent's assistance enabled him to win the Imperial Crown as well. Innocent's estimate of Frederick II's character and intentions seems to have been as wide of the mark as his estimate of Otto's had been a few years before. No doubt Frederick was anxious to take his revenge upon Otto for having overrun the Sicilian dominions on the Italian mainland, but Innocent had no evidence that the boy was either grateful to Innocent himself for having intervened on his behalf, or well-disposed to the Papacy as an institution. At the interview between the fifty-two-years-old Pope and the eighteen-years-old king in A.D. 1212 Innocent was completely taken in by Frederick's precocious plausibility.

'One of the first acts of Frederick was to renew to the Pope in person the homage he had already paid to his deputy for the Kingdom of Sicily. Innocent, charmed with the youth's courage and docility, espoused his cause with vigour. By letter he called upon the communes of North Italy and the people of Germany to cast in their lot with Frederick; he poured money into the youth's purse, procured for him a Genoese fleet to conduct him to their city, and sent a cardinal-legate with him to win for him greater obedience.'¹

Thanks to Innocent's support Frederick was crowned King of the Romans at Mainz before the year was out, and Otto's star duly sank as Frederick's rose towards its zenith. Yet, when Innocent was thus exerting all his powers in order to make his protégé master of Germany, he does not seem to have taken the precaution of exacting from him in advance a pledge that he would surrender his Sicilian Kingdom if he were successful in his Transalpine enterprise.² It was not till the year 1216, when Innocent was on his death-bed, that Frederick issued a bull engaging himself, as soon as he should have received the Imperial Crown, to hand on the Sicilian Crown to his son, 'in order to preclude the suspicion of anything in the nature of a union between the Kingdom and the Empire . . . to the possible detriment of the Apostolic See and of our own heirs'.³ The declaration, when it came, was specious, like most of Frederick's acts; but from Innocent's point of view it

¹ Mann, *op. cit.*, vol. xi, pp. 214-15. The authorities are cited in Carlyle, *op. cit.*, vol. v, pp. 230-1.

² Perhaps Innocent was counting on the fact that Frederick, before assuming the Imperial title and leaving Sicily for Rome *en route* for Germany, had not only sworn fealty to the Pope and accepted a concordat on Innocent's terms, but had had his infant son Henry crowned as King of Sicily.

³ Latin text quoted in Mann, *op. cit.*, vol. xi, p. 220, footnote 3, and in Carlyle, *op. cit.*, vol. v, p. 237, footnote 3.

562 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS came too late; for by 1216 Frederick, though he had still to be crowned Emperor in Rome, was already in the saddle in Germany without having yet evacuated his seat on the Sicilian Throne. In these circumstances the execution of his promise rested in his hands alone. Meanwhile, he held the Roman See in a vice, as his father had momentarily held it in the years 1194-7; and thus Innocent left the great institution which had been placed in his keeping in so prosperous a political condition eighteen years before, at the mercy of a son of Henry VI and a grandson of Frederick Barbarossa.

This lack of intuition in divining character, which Innocent showed when he lent his support to an Otto against a Philip and to a Frederick against an Otto, is more flagrantly apparent in his attitude towards Saint Francis. This shepherd of souls who was unduly soft and credulous in accepting at their face value the specious protestations of princes, showed himself unduly cold and cautious when he had to appraise the sainthood that shone like the Sun through Francis' countenance; and here it is difficult to draw the line between obtuseness and *ὑβρις*. Was Innocent unaware of Francis' greatness or indifferent to it? Did his aloofness from the deepest spiritual movement of his age reflect the pre-occupation of a man of affairs or the superciliousness of an aristocrat? Even if we give Innocent the benefit of the doubt and acquit him, as Francis himself would have hastened to acquit him, of *ὑβρις* on Francis' account, at any rate we must count it for righteousness to Innocent's great-nephew Ugolino de' Conti that the future Pope Gregory IX was more sensitive than his relative and predecessor to Francis' sainthood, though he too was an aristocrat and a man of the world. And there is another count against Innocent III on which the charge of *ὑβρις* cannot be rebutted. A Pope whose predecessors had been content to style themselves 'Vicar of Peter' assumed the style of 'Vicar of Christ'.² This was an ominous

¹ For the relations between Innocent and Francis see Sabatier, P.: *Vie de Saint François d'Assise*, chap. 6, and Grundmann, H.: *Religiöse Bewegungen im Mittelalter* (Berlin 1935, Ebering), pp. 128-51. For the relations between Innocent and the religious movement of which Saint Francis was the pioneer within the bounds of the Church see Grundmann, op. cit., *passim*, but especially, perhaps, the passages quoted in the present study in IV. C (iii) (c) 3 (8), Annex, below.

² 'Soon after he ascended the Papal Throne, Innocent III began to use the phrase "Vicar of Christ" in connexion with his office. It had not been used before his time; and the implication that the successors of Peter were not his deputies, but received their commission, as he did, immediately from Christ, is significant of the conviction upon which the policy of Innocent was founded. . . . The assertions of Innocent III went far to establish the Papacy in the possession of semi-divine honours.'—Thompson, A. H., in *The Cambridge Medieval History*, vol. vi (Cambridge 1929, University Press), p. 644. On p. 43 of the same volume Professor E. F. Jacob quotes an illuminating passage (which is also quoted from Migne, *Patrologia Latina*, vol. ccxvii, col. 665 A and B, in Carlyle, op. cit., vol. v, p. 153, footnote 2) from a sermon (III) which was preached by Innocent III himself on one of the anniversaries of his consecration: 'Nam caeteri vocati sunt in partem sollicitudinis, solus autem Petrus assumptus est

departure from the humility of a Gregory the Great, who had taken the title of *Servus Servorum Dei* when his colleague John the Faster at Constantinople had proclaimed himself 'Oecumenical' Patriarch. In the year of Innocent's death John's 'Oecumenical' successor was a refugee at Nicaea from a Patriarchal See that was under the heel of Innocent's truant crusaders. The omen was unfavourable to the successors of the first Roman 'Vicar of Christ'. 'Woe unto you when all men shall speak well of you'¹ is Innocent's epitaph.

Innocent's failure of judgement can be measured best, like Hildebrand's, by marking its sequel; for the breathing-space which had opened with Innocent's accession did not outlast his death. It was followed by a battle between the Papacy and the Emperor Frederick II which surpassed in fury the battles of earlier Popes with the first Hohenstaufen Frederick and with the last two Franconian Henrys. Up to a certain point history repeated itself. In the first round of the struggle the gentle role of a Paschal II or a Hadrian IV was played by the unwarlike and undecided Pope Honorius III,² while in the next round the harder and more worldly Pope Gregory IX played the militant role of a Calixtus II or an Alexander III. This time, however, it took more than one militant pontificate to wear down the strength of the Papacy's Imperial antagonist; and the worldly-wise Ugolino de' Conti, who had patronized as well as appreciated Saint Francis, and who excommunicated Frederick in 1227 in the mood of a realist who means to stand no nonsense, died fourteen years later *re infecta*. It needed Sinibaldo Fieschi's two-handed sword to shear through the Saracenic armour that had turned the edge of an Ugolino's razor-blade; and that terrible weapon in those implacable hands made havoc of everything in its path as it swung to and fro across the face of Europe in pursuit of its elusive prey.

'In those days wickedness prevailed; the people of God were without

in plenitudinem potestatis. In signum spiritualium contulit mihi mitram, in signum temporalium dedit mihi coronam; mitram pro sacerdotio, coronam pro regno, illius me constituens vicarium qui habet in vestimento et in femore suo scriptum: "Rex regum et dominus dominantium; sacerdos in aeternum, secundum ordinem Melchisedech".'

Even this is not the highest flight of Innocent's *ὕψος*. In another sermon (II) on the same subject (quoted from Migne, op. cit., vol. cit., cols. 657-8, in Carlyle, op. cit., vol. cit., p. cit., footnote 1) Innocent follows up a sentence which is identical with the first sentence of the passage quoted above, with the almost blasphemous assertions:

'Iam ergo videtis quis iste servus qui super familiam constituitur: profecto vicarius Iesu Christi, successor Petri, christus Domini, deus Pharaonis; inter Deum et hominem medius constitutus, citra Deum, sed ultra hominem; minor Deo, sed maior homine; qui de omnibus iudicat, et a nemine iudicatur; Apostoli voce pronuntians: "qui me iudicat, Dominus est".'

Could *ὕψος* call down judgement upon itself more vociferously than this?

¹ Luke vi. 26.

² Honorius's statement of policy after his election in A.D. 1154 was that 'he wished to proceed by clemency rather than by vigour' (*Epistulae Honorii*, i, 30, quoted by Mann, op. cit., vol. xiii, p. 209).

a ruler; Rome lay desolate; the glory of the clergy departed; and the people of God were divided. Some followed the Church, and these took the Cross [against Frederick], while others followed Frederick the *ci-devant* Emperor, and these insulted the Divine Religion. . . . Mercy and Truth and Justice were no longer to be found on Earth.¹

Germany had not seen such a war since Charlemagne's attrition of the Saxons, and Italy not since the extermination of the Ostrogoths by Belisarius and Narses. In Italy, in this fifth decade of the thirteenth century,

'Men could neither plough nor sow nor reap nor cultivate the vine nor gather the vintage nor live on the farms—especially in the territories of Parma, Reggio, Modena, and Cremona. Close to the cities themselves, however, men tilled the ground under the guard of the city militia, who were divided into quarters corresponding to the city gates. Armed soldiers guarded the labourers all day, and the country people carried on their agricultural work under these conditions. This was necessary on account of the highwaymen, thieves and robbers who had multiplied exceedingly and who kidnapped people and carried them off to dungeons to be ransomed for money. They also lifted the cattle, and ate or sold them. If their prisoners did not raise a ransom, they hanged them by the feet or the hands and pulled out their teeth and put paddocks and toads (*buffones sive ruspos*) in their mouths to hurry them up in producing the ransom money; and these tortures were more bitter and abominable to them than any form of death. The brigands were more cruel than demons; and in those times one human being was about as glad to meet another human being on the road as he would have been to meet the Devil himself; for everyone was living in perpetual suspicion of everyone else—suspecting his neighbour of intending to kidnap him and throw him into a dungeon, in order that "the ransom of a man's life" might be "his riches" (Proverbs xiii. 8). So the land was reduced to a desert, empty of both husbandman and wayfarer. For in the days of Frederick—and especially after his deposition from the Imperial office, and after Parma had rebelled against him and had lifted her heel—"the highways were unoccupied, and the travellers walked through byways" (Judges v. 6). And evils multiplied on the Earth. Wild birds and wild animals multiplied quite beyond measure—pheasants, partridges and quails, hares, roebuck and fallow-deer, buffaloes, wild-boars and ravening wolves. These wild beasts no longer found creatures—lambs or sheep—to eat, as they had been used to finding them, on the farms, because the farms had been burnt to ashes. And so the wolves used to gather in packs round the moat (?) of a city (*circa foveas alicuius civitatis*)

¹ 'Eodem tempore prevaluit iniquitas, et populus Dei sine rectore fuit et Roma in desolatione, et decor clericalis perit, et divisus est populus Dei—partim sequebantur Ecclesiam, et hii signati sunt, partim favebant Fridrico quondam imperatori, et hii insultabant Divine Religioni . . . Et Misericordia et Veritas et Judicium de Terra sublata sunt.'—*Annales Scheflarienses Majores*, sub anno 1246, apud *Monumenta Germaniae Historica*, ed. by Pertz, S. H., vol. xix of the whole series = vol. xvii of the *Scriptores* (Hanover 1861, Hahn), p. 342. (The Monastery of Schäftlarn stands on the banks of the River Isar, above Munich, in the diocese of Freising.)

and howl aloud under the extreme torment of their hunger. And they used to creep into the cities by night and devour people—women and children among them—who were sleeping under porches or in waggons. Sometimes they even burrowed through the house walls and strangled the babies in their cradles. No one who had not seen them—as I saw them—could believe the horrors which were committed at that time, not only by men, but by beasts of various kinds.¹

This was the darkness that descended upon Western Christendom after the brief noon-day of Innocent III's pontificate. And it was not for nothing that Sinibaldo Fieschi chose Lotario de' Conti's pontifical name when his own turn came to ascend the Papal throne. Notwithstanding the sharpness of the contrast between the characters of the Roman nobleman and the Genoese, the pontificate of the fourth Innocent followed that of the third as inevitably as night follows day.

The third and culminating act of the tragedy opens on the 13th December, 1250, which is the date of Frederick II's sudden and premature death. Would Pope Innocent IV accept this heaven-sent opportunity of restoring peace to Western Christendom, or would he pursue his vendetta against Frederick's house to the bitter end? Peace was not only demanded by the misery and devastation which this latter-day Hannibalic War had spread; it was cried out for by the conscience of the *Plebs Christiana*, which found its spokesman in Saint Louis. The King of France was as unwilling to place his sword at Innocent's service for the destruction of Frederick as he was to make common cause with the Emperor against the Pope. His single-minded aim was to bring to an end this impious civil war in the bosom of Western Christendom in order to release and unite her forces for a fresh crusade. Saint Louis made vain attempts at mediation in 1245, and again in 1246, and his anxiety was well warranted; for in the latter year Innocent actually forbade the preaching of the crusade *d'outre mer* within the boundaries of the Holy Roman Empire, and ordered that certain moneys which had been raised in the Empire for the conduct of the war against the Muslims should be diverted to the coffers of the Pope's own puppet *Gegenkaiser*, William of Holland. The Frisian crusaders who had already enlisted under Louis's banner were allowed, and perhaps encouraged, to commute their vows and acquire their merit by fighting, instead, for William against

¹ Salimbene's *Chronicle*, first edition (Parma 1857, Fiacadorii), pp. 70–71, *sub anno* 1247. The last touch in this grim picture recalls to the writer of this Study a vision of Western Anatolia as he saw it, during the Graeco-Turkish war-after-the-war, in 1921, when the only plough-marks on the surface of a desolate country-side were the rootings of the wild boars who had entered into the heritage of the vanished human inhabitants. The picture as a whole will recall to the minds of readers of our generation the aspect of China as it has come to be since the outbreak of the Revolution in A.D. 1911.

Frederick. The utmost concession that Innocent would make to Louis's protests was that the crusade *d'outre mer* should be preached in five Lotharingian dioceses on the fringe of the Empire along the French border.¹ In 1248, when Louis *en route* for his Mediterranean port of embarkation had his last interview with Innocent at Lyon and sought to mediate between Pope and Emperor—once more in vain—the royal saint is reported to have told the Papal sinner that the sin would be on his head if the Egyptian expedition failed;² and by the date of Frederick's death this curse was in operation; for, eight months before Frederick died in Apulia, Louis had been taken prisoner in the Delta.³ Now that Frederick was dead, would Innocent lift the curse by making peace with Frederick's children? Innocent's answer was in the negative; and this negative answer—which assuredly⁴ was no mere error of judgement but was a moral aberration as well—spelt the suicide of the Hildebrandine Papacy.

The death of his arch-enemy did not move Innocent from the stand which he had taken three years before, when he had declared his determination never to make peace so long as either Frederick himself or any of his sons remained king or emperor.⁵ In this declaration Frederick's brood was deliberately included in a ban which had been confined, in an earlier Papal anathema,⁶ to Frederick's own person; and Innocent did not now abate one jot or tittle of the war-aims to which he had committed himself. His rejoinder to the news of Frederick's death was to command the notables of Sicily to place the kingdom at his own disposition. When Frederick's son Conrad took up his father's Sicilian heritage, Innocent renewed the excommunication against him and ransacked Christendom to find a Papal nominee to the Sicilian Throne who could and would take the kingdom from Frederick's heirs by force of arms. When Conrad, dying only four years after his father at

¹ Mann, *op. cit.*, vol. xiv, p. 169. The five dioceses in question were Liège, Cambrai, Toul, Metz, and Verdun. It is interesting to observe that these were all French-speaking districts. In the Papal permission accorded to these French-speaking Lotharingians to march with the King of France can we see a first glimmer of our latter-day Western linguistic nationalism?

² Mann, *op. cit.*, vol. xiv, p. 170, on the authority of Matthew Paris (*Chronica Maiora*, Luard's edition in the Rolls Series, vol. v, p. 175). The story may, of course, have been *ben trovato*, either for the political purpose of deepening Innocent's infamy or for the artistic purpose of heightening the tragic pathos of the subsequent fortunes of Louis's ill-starred enterprise; yet there is no positive ground for assuming that the incident is fabulous; and it is in entire conformity with the character of both parties.

³ See IV. C (iii) (c) 2 (y), pp. 447-9, above.

⁴ Pace the plea of a distinguished modern Western historian which has been quoted on p. 548, footnote 3, above.

⁵ 'Promittimus . . . nec etiam pacem aliquatenus cum praefato Frederico reformabimus ita quod ipse vel aliquis filiorum suorum rex aut imperator existat.'—Innocent IV, letter of the 4th May, 1247, quoted by Mann in *op. cit.*, vol. xiv, p. 97, footnote 1.

⁶ In a letter of the 28th January, 1247, the formula had been promulgated with reference to Frederick alone (see Mann, *op. cit.*, vol. xiv, p. 96).

the age of 26, commended his infant son Conradin to the protection of the Holy See, the Pope rejected the bequest and announced his intention, pending the child's coming of age, to take over the government of the kingdom himself. This was the policy which Innocent bequeathed to his successors; and it duly ended in the extinction of Frederick's line through Manfred's death in battle in 1265 and Conradin's on the scaffold in 1268.

Their executioner was Charles of Anjou—a most unsaintly brother of Saint Louis—yet it is significant that even this hard and covetous secular prince should have hesitated for nearly eleven years before he accepted in 1264, at the hands of Pope Urban IV, an offer of the Kingdom of Sicily that had been made to him by Pope Innocent IV as early as 1253. To what considerations in Charles' mind was this extraordinary hesitation due? It was not that he was unambitious, for the passion of his life was to acquire a kingdom as great as that which his brother had inherited; and when once he was launched upon his Sicilian enterprise his lustful vision overshot the Straits of Otranto, as well as the Straits of Messina, and embraced the Empire of Romania. Nor was it that Charles doubted the Pope's ability to 'deliver the goods'; for the Kingdom of Sicily was a fief of the Holy See which was legally at the overlord's disposal if the tenure could be shown to have fallen vacant or forfeit; and in 1246 Innocent had actually enabled Charles to acquire the County of Provence, though this Imperial fief had not been Innocent's to bestow. The consideration which moved Charles' counsellors to oppose his acceptance of Innocent's offer in 1253,¹ and led Charles himself to leave the question in abeyance for ten years after that, was the consciousness that this Papal invitation to do a terrier's work and exterminate Frederick's brood in the hole where they had gone to earth was an invitation to commit an enormity which would cry aloud for vengeance. When Charles eventually succumbed to the temptation which was dangled before his eyes by Innocent and his successors, the enormity was indeed committed and the vengeance duly followed. Manfred and Conradin were avenged upon Charles in the Sicilian Vespers, which paralysed Charles' power and blighted his ambitions three years before his death. They were avenged upon the Papacy when Innocent IV's thirteenth successor, Boniface VIII, picked his quarrel with the second successor of Saint Louis, Philip the Fair.

¹ When this opposition was raised, Innocent 'suggested to his legate a way out of the difficulty which did much more credit to him as a lawyer and a diplomat than as a Pope. Albert was to promise in his name to agree to such recommendations on the disputed points as should be made to him by two prelates and a knight nominated by Charles. But the Count was previously to give the legate an undertaking in writing that the said promise was to be without real effect. But the advisers of Charles were not satisfied.'—Mann, *op. cit.*, vol. xiv, p. 135.

'Woe to that man by whom the offence cometh!'¹ The Papacy's Angevin agent escaped with the loss of half his ill-gotten kingdom; the Papacy itself was punished with the loss of the whole of its Hildebrandine heritage; and it was condemned, in addition, to execute this sentence with its own hands.

If an Athenian tragic poet of the fifth century B.C. could have been given the story of the Hildebrandine Papacy as the theme for a trilogy, he would probably have impersonated *κόρος* in Gregory VII and *ὑβρις* in Innocent IV, and in that case he would certainly have cast Boniface VIII for the role of *ἄτη*; for in the pontificate of Boniface the Papacy, now distraught by the blood-guiltiness which Innocent had fastened upon her, strode over the edge of a precipice with eyes that were open yet unseeing.

The note of *ὑβρις* which Innocent III had struck when he proclaimed himself 'the Vicar of Christ,' and Innocent IV when he included Frederick's children in the remorseless vow which he had taken against Frederick himself, was sounded for the third time by Boniface VIII when he seized the occasion of the turn of the century to inaugurate the institution of the Papal Jubilee. It was the enthusiasm of the response to his call and the multitude of the pilgrims who flocked to Rome in the Holy Year 1300 from all quarters of Western Christendom that fostered in the Pope's imagination his fatally delusive belief in his own terrestrial omnipotence. The fervour was genuine, and the heads could be counted; but this pilgrimage to the Apostle's shrine was an act of homage to the idea of the Papacy as Hildebrand had impressed it upon Western minds, and not to the reality as it had been shaped by the coarser hands of Hildebrand's successors. Boniface saw the pilgrims but not their neighbours who had stayed at home; he heard the acclamations around him, and these agreeable voices drowned, in his ears, the murmurs of a provincial clergy who were still being called upon to pay the Papal war-taxes a generation after the Papal Punic Wars had been brought to their dreadful termination. He did not understand that neither the clergy nor the *Plebs Christiana* would be willing to risk life and fortune in order to support a Papal against a secular tyranny; he assumed that they would rise at his call as they had risen at Hildebrand's. In this delusion he provoked the King of France into drawing his sword, and then ran straight upon the extended sword-point, in confidence that any secular weapon must crumple under the drum-fire of his own ecclesiastical artillery.

The sequel to this suicidal act was the outrage at Anagni and 'the Babylonish Captivity' at Avignon and the Great Schism which

¹ Matt. xviii. 7.

rent Western Christendom in two; and each of these calamities might have been foreseen and feared and averted by Boniface himself if his vision and judgement and action had not been confounded by the *ἀρχή* that was incarnate in him.

A *coup de force* against the Pope's own person was the first counter-attack that any Pope had to expect from a secular prince upon whom he had declared war. Had Boniface forgotten in 1303 how Paschal II had been kidnapped by Henry V in 1111, and Hildebrand himself by Cencio on Christmas Day 1075? If a Henry IV could find a Cencio to do his dirty work, why should not a Philip the Fair find a Sciarra Colonna?

Again, the attraction of the Papacy into the orbit of the French Crown did not begin in 1305 when the Gascon Bertrand de Goth was elected, by grace of King Philip, to be Pope Clement V, and obediently came to be crowned at Lyon and lodged at Avignon on his secular master's threshold. Long before that, Pope after Pope had sought asylum in France from the moment when the struggle between the Papacy and the Empire began. Urban II had come to Auvergne to preach the First Crusade; Paschal II had been safe from outrage when he was negotiating with Henry V at Châlons-sur-Marne; Gelasius II had died out of Henry's reach at Cluny; Calixtus II had fought the same Emperor from a French base of operations until his ascendancy over his adversary was sufficiently well established to enable him to set foot in Rome; Innocent II had fled to France before the face of the Jewish antipope Pietro Pierleone; Alexander III had withdrawn into a French citadel when Frederick I, at the zenith of his power, had made Italy too hot for him; and Innocent IV had followed Alexander's tactics at the height of his own struggle with Frederick II. Even when the destruction of the Hohenstaufen and the Great Interregnum in the Empire had relieved the Papacy from all danger of being attacked by an emperor in Italy, Pope Gregory X looked beyond the north-western bounds of the Italian Peninsula and fixed his choice upon the French-speaking city of Lyon, on the last stage of the road leading out of the Holy Roman Empire into the French Kingdom, as the trysting-place for a council which was to deal with three matters of such capital importance for the whole of Western Christendom as the reconstruction of the Empire and the reconciliation of the Greeks¹ and the resumption of the Crusades. Could not Boniface feel it in his bones that the pull of France had become the greatest danger by which the Holy See was threatened now that the threat from Germany had been removed? And could not he understand that the surest way of making this pull irresis-

570 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
tible was to challenge the King of France, who now held the Papacy in the hollow of his hand, to a trial of strength?

As for the Great Schism, it had been already foreshadowed by the time of Boniface's pontificate in the series of interregna which had been interrupting the Hildebrandine succession for some fifty years past. A twenty-seven months' interregnum had preceded the election of Boniface's own immediate predecessor Celestine V in 1294; there had been a thirty-three months' interregnum before the election of Gregory X in 1271; and a nineteen months' interregnum before the election of Innocent IV in 1243. The inability of the cardinals to agree upon a successor to Gregory IX at the supreme crisis of the struggle between the Papacy and Frederick II, when Hannibal was thundering at the gates, was proof in itself that the electoral machinery which had been installed on Hildebrand's initiative in 1059 was badly out of gear. The Hildebrandine provision for regular and orderly and peaceable elections to an office which was apt to fall vacant at short intervals was one of the essential foundation-stones of the whole Hildebrandine edifice, just as, conversely, the turbulence and corruption of the Papal elections during the preceding century and a half had been one of the principal causes of the Papacy's abasement in that unhappy period. If the Hildebrandine conclave which had then exorcized the Marozian pandemonium of violence and intrigue were now to beget interregna, the last state of the Papacy might be worse than the first. A corrupt election or a contested election might be less disastrous than a failure to make any election at all. The evil was borne in upon Pope Gregory X by the antecedents of his own election; and three years later, in 1274, the Council of Lyon, sitting under his presidency, passed, in the teeth of the College of Cardinals, the constitution *Ubi periculum* for expediting Papal elections in the future. This constitution, however, was promptly abrogated by Pope John XXI in 1276; a fresh interregnum between the death of Nicholas IV and the election of Celestine V was the consequence; and Boniface VIII, who had been a member of the conclave that stuck in the mud on that unseemly occasion, knew well enough that the eventual choice of the shy Abruzzese hermit had not been an inspiration of the Holy Spirit, or even a sop to public opinion, but had been a counsel of despair. This despair had been justified in the event by the 'Great Refusal' which had opened the way for Benedetto Caetani himself to mount the Papal throne.¹ No living man had had better opportunities than his of apprehending the seriousness of the heart-disease which was the Papacy's legacy from the terrible overstrain of its struggle with Frederick II.

¹ See p. 550, footnote 2, above.

A heart which was subject to such protracted stoppages as these might fail altogether if the patient were exposed to another great exertion or great shock. That Boniface, of all men, knowing what he knew, should have challenged the King of France when the Papacy was in this parlous state would be inexplicable in a man who was altogether in his right senses.

The fourth and last act in the Hildebrandine tragedy opens after the turn of the fourteenth and fifteenth centuries with the advent of the Conciliar Movement.

The scandal of the Great Schism¹ moved the children of the Papacy—a provincial clergy whom a Hildebrand had once rescued from the heavy hand of the secular power, and universities whom an Alexander III had nursed through their infancy—to come to the rescue of the most venerable institution in Western Christendom. Their misgivings at the rancour and rapacity of an Innocent IV and their resentment at their own sufferings from the growing fiscal and administrative tyranny of the Curia were now reinforced by two further considerations: a concern for the life of the Western body social, which might sustain a fatal injury through the self-destruction of its most vital organ; and a compunction towards an institution whose Hildebrandine virtues were once again remembered, side by side with its Innocentian vices, now that Hildebrand's work was in mortal danger of being utterly undone. Accordingly a Holy See which had commanded devotion in the days of a Hildebrand and an Alexander III, and had then bred disillusionment in the days of an Innocent IV and a Boniface VIII, came to inspire a different emotion again when the house divided against itself was on the verge of collapse. This new attitude, of which the Conciliar Movement was the outcome, combined a filial piety with a moral reprobation. The reformers were anxious to save the Papacy from suicide, but their anxiety was for the sake of the Christian Republic as well as for the sake of the Papacy itself. They were determined to reconstruct the falling house, but not on the former plan. Whatever Hildebrand's original design may have been, his building, as it had grown under his successors'

¹ The Great Schism evidently made a far more painful impression upon the fourteenth-century Western conscience than 'the Babylonish Captivity'. The migration of the Curia to Avignon might be the Romans' funeral; but for the Western *Plebs Christiana* at large, who regarded the Papacy as their common possession, it did not much matter where the Pope took up his abode as long as he remained somewhere within the borders of the Western Commonwealth; and Avignon (see p. 520, footnote 2, above) stood only second to Lyon (see p. 569, above) in respect of its geographical convenience as a centre for the ecclesiastical administration of the Western Patriarchate. On the other hand the Great Schism, which the Romans did not much mind so long as one of the rival Popes again made Rome his headquarters, filled the rest of Western Christendom with dismay because it was destructive of the unity of the *Repubblica Christiana*. On this account the Papal schism evoked a much more vigorous reaction than the Papal sojourn at Avignon in the Western World as a whole.

hands, had become top-heavy. The ancient primacy of the Roman See among the thousand bishoprics of Western Christendom had towered up into a modern centralized autocracy; the Papal aegis that had been stretched over the devoted heads of the *Plebs Christiana* had turned into a cope of lead. This increasing top-heaviness was the fault in the pontifical architecture which was bringing the building down in ruin. It would be folly to re-erect the house on the old lines and so invite a repetition of the catastrophe. The reconstructed pyramid must have a lower apex and a broader base.

It will be seen that in the programme of the Conciliar Movement the Papacy was being offered a chance of retrieving its position, but that the offer was conditional—as any offer of salvation must be if it comes at the thirteenth hour when it is already too late to restore the *status quo ante*. In this act the former relations between the Roman See and the provinces of the Western Ecclesiastical Commonwealth were inverted. It was the provinces, now, that were taking the initiative and coming to the rescue; and a rescuer has an intrinsic right to exercise a certain control over the conduct of the party that is receiving his aid, while, conversely, he who has to accept the help of others because he has failed to help himself has an intrinsic duty to yield to his helpers' guidance. The condition to which the Papacy was asked to assent as the price—and guarantee—of its rehabilitation was the introduction of a parliamentary element into the constitution of the Western body ecclesiastic. In the ecclesiastical field this idea was nothing new. In the history of the Church, Oecumenical Councils were an older institution than Patriarchs; and we have seen above¹ how the Hildebrandine Papacy deliberately revived the Conciliar system in the West in the twelfth century in order to fortify itself against the Empire, and how in the following centuries the Kings of England and France—perhaps herein taking a leaf out of their Papal adversary's book—took care to fortify themselves with parliamentary support when they summoned up their courage to resist the Papal pretensions. In the fifteenth century the Papacy was asked to carry one stage farther in the ecclesiastical field the development of an institution which had been re-introduced into that field by Pope Calixtus II and had since been adopted in the field of parochial secular affairs by King Edward I of England and King Philip IV of France. Would the Papacy be willing to atone for its past and assure its future by bowing, in this matter, to the will of Western Christendom? Once again a Pope had to take a decision which was momentous for the fate of the Western World as well as for that of the Roman See; and, once again, the answer was in

¹ See p. 542, above.

the negative. The Papacy rejected the parliamentary principle and opted for an unrestricted sovereignty in a restricted field as the alternative to accepting a limited constitutional authority over a loyal and undivided Christian Commonwealth.

The decision was taken at the Council of Constance (*sedebat* A.D. 1414-18) in the crucial year 1417. After the Council had performed its negative task of ridding the Western Church of the three unworthy pretenders who had been contending for the title to the Papal office, two further tasks lay before it: the reform of the government of the Christian Commonwealth in both principle and practice; and the election of a worthy incumbent for its highest magistracy. In what order were these tasks to be taken? The Conciliar Party desired that the Council should first decide upon the reforms and then elect a Pope who would be bound in advance to govern in accordance with the new constitution; the Curial Party desired that the Pope should be elected first, in order that the proposed reforms might be worked out under Papal auspices. In this dispute over procedure the question of substance was at stake; and the Conciliar Party accepted defeat when the Emperor Sigismund agreed on their behalf that the new Pope should be elected first. When once this crucial point had been conceded, it was in vain that Sigismund stipulated for the postponement of the new Pope's coronation until after the reforms had been promulgated; in vain that the Council hastened to pass the decree *Frequens*,¹ which provided for the Council's own re-assembly at stated regular intervals; and in vain that, when the conclave was formed, the twenty-three cardinals were reinforced by thirty non-Curial electors representing the five nations into which the Council was articulated. The first act of Cardinal Oddone Colonna, after his election to be Pope Martin V,² was to confirm the rules of the Papal Chancery which had been issued by Pope John XXIII; and this was an ominous act; for John was the most disreputable of Martin's three rival predecessors, and his rules embodied abuses which the Council had marked down for reform, as well as non-contentious standing orders which had to be legally in force if the wheels of Papal administration were to be kept running. Thereafter Pope Martin made proposals for reform on his own part; but he evaded the crucial point of defining the causes for which a Pope might be admonished or deposed; the statutes which were passed under his auspices³ covered only a few

¹ On the 9th October, 1417.

² On the 11th November, 1417.

³ On the 21st March, 1418, seven reformatory decrees were approved and accepted by the Council in fulfilment of a decree of the 30th October, 1417, which had provided, among other things, that, before the dissolution of the Council, the new Pope (who at that date had still to be elected) was, with the Council's assistance, to reform the Church in eighteen specified matters.

of the questions which the Council had placed on the agenda; and the rest were left over for the Pope to deal with in separate concordats which he was to negotiate with the several nations of the Western Commonwealth.¹ By the time when the Council adjourned and the Pope left Constance for Rome, the course of the next chapter of Western history had been determined; for the outcome of the Council of Constance was confirmed by the heavier defeat which the Conciliar Movement sustained at the subsequent Council of Basel (*sedebat* A.D. 1431-49) in the pontificate of Eugenius IV.

'The same year and almost the same day were marked by the deposition of Eugenius at Basel and, at Florence, by his reunion of the Greeks and Latins. In the former synod (which he styled, indeed, an assembly of demons) the Pope was branded with the guilt of simony, perjury, tyranny, heresy and schism and declared to be incorrigible in his vices, unworthy of any title, and incapable of holding any ecclesiastical office. In the latter he was revered as the true and holy Vicar of Christ, who, after a separation of six hundred years, had reconciled the Catholics of the East and West in one fold and under one shepherd. The act of union was subscribed by the Pope, the [East Roman] Emperor, and the principal members of both churches. . . . A clamour was artfully propagated against the remnant of a schism in Switzerland and Savoy which alone impeded the harmony of the Christian World. The vigour of opposition was succeeded by the lassitude of despair; the Council of Basel was silently dissolved; . . . all ideas of reformation subsided; the Popes continued to exercise and abuse their ecclesiastical despotism.'²

This outcome of the rival councils of Basel and Florence might seem to have reinstated the Papacy in the triumphant position which it had occupied at the close of the Council of Lyon in the pontificate of Gregory X, and to have wiped out all the humiliations through which this extraordinary institution had passed during the intervening chapter of its history which had begun at Anagni with the outrage upon Boniface VIII and had closed at Constance with the election of Martin V. In reality that chapter could not be expunged from the pontifical records as though it were an accidental misfortune without any causal relation to its historical antecedents and therefore without any practical significance.³ Actually,

¹ These concordats were duly negotiated, and their terms were registered on the 15th April, 1418; but they were only concluded for a term of five years and they were nowhere properly put into effect (see *The Cambridge Medieval History*, vol. viii, p. 18).

² Gibbon, E.: *The History of the Decline and Fall of the Roman Empire*, ch. lxvi.

³ 'Point after point of the charges brought forward at the Council of Constance against the Papal administration of the preceding thirty years is equally apposite to the conditions obtaining eighty years later. The misdemeanours which were a chronic disease of the Curia in and after the second half of the fifteenth century are in the fullest sense a legacy from the time of the Schism.'—Hofmann, W. von.: *Forschungen zur Geschichte der Kurialen Behörden vom Schisma bis zur Reformation* (Rome 1914, Loescher, 2 vols.), vol. i, p. 1.

as we have seen, the fall of A.D. 1303 had followed hard upon the heels of the triumph of A.D. 1274 because the triumph had masked a perilous state of exhaustion and weakness, and in masking it had blinded the Papacy to the urgent need in which it stood of minding its steps and mending its ways. To ignore the lesson of the humiliations of 1303-1417 in an hour when the Papacy was at last triumphant once again was to court a fresh disaster; and this was the mistake which was made by the Curia in the critical years between the election of Pope Martin V in 1417 and the dissolution of the Council of Basel in 1449. Popes Martin V (*fungebatur* A.D. 1417-31) and Eugenius IV (*fungebatur* A.D. 1431-47) were not indeed hostile to reform in principle; so far from that, the former, at any rate, did seriously attempt to carry out many of the measures which the Council of Constance had demanded.¹ But these Papal efforts at reform were stultified by the fatal weakness of their not being the Papacy's paramount aim or interest. During these critical pontificates the Pope's overriding concern was to assert his own pretension to exercise an autocratic authority; and in this frame of mind he was less inclined to welcome the Conciliar Movement as a potent reinforcement to the cause of reform than he was to turn against that cause for fear that its promotion by the Conciliar method might produce, as a by-product, a limitation of the Papal prerogative. This Papal impulse to subordinate the reform of the Church to the aggrandisement of the Papacy was perhaps responsible, more than any other factor, for that misunderstanding between the Papacy and the Conciliar Movement which came to an open breach in the quarrel between Pope Eugenius IV and the Council of Basel. And in the intoxication of its victory over the Conciliar Movement in this naked trial of strength the Papacy abandoned itself once more to the lust for power² which had been its besetting sin since the days of Hildebrand. With one hand it clung to the despotic ecclesiastical power over the provinces of the

¹ 'In face of the attitude of the Pope (which was indeed only the attitude that was to be expected)—and especially after the decree promulgating the Chancery rules [see the present chapter, p. 573, above—A.J.T.] which reaffirmed in traditional fashion all the reservations, including those to which exception had been taken, without regard to the negotiations [at the Council of Constance]—no very energetic measures on the part of the new Pope [Martin V] were to be looked for. A considerable time was, in fact, to pass before the appearance of anything like a thorough-going reform bull. Unobtrusively, however, one individual measure after another was taken for bringing some provisional order into the situation in the individual offices [of the Curia], tightening the control over the existing arrangements, and thus preparing the way for a general reform. . . . There was hardly any motion that the Reform Movement had made which was destined to be left unconsidered in the further course of [Martin V's] pontificate. . . . [And] yet the activity of Martin V's endeavours in this field did not bear fruit in any corresponding success.'—Hofmann, *op. cit.*, vol. i, pp. 11-12.

² For the encroachment of a capricious Papal absolutism upon the Curia's traditional regard for legality and regularity during the interval between the failure of the Conciliar Movement and the outbreak of the Reformation see Hofmann, *op. cit.*, vol. i, pp. 323-6.

Western Church which it had been unexpectedly successful in retaining; with the other hand it continued to build up its secular territorial power in Central Italy, and, in playing their part as fifteenth-century Italian despots, the Popes became steeped in that pride of life which was the dominant note of the medieval Italian culture in its fifteenth-century over-ripeness. In this generation and this mood a Rodrigo Borgia on the Papal throne out-heroded a Baldassare Cossa;¹ and, once again, the fox was caught.² Within less than a hundred years after the dissolution of the Council of Basel in 1449 the Papacy was in even worse case than it had been in when the Council of Constance had opened in 1414.³ The Pope had defeated the Conciliar Movement to his own undoing. 'He made a pit and digged it, and is fallen into the ditch which he made.'⁴

After the turn of the fifteenth and sixteenth centuries the power which the Papacy had refused to share constitutionally with a parliament of the Christian Commonwealth was lawlessly snatched out of its hands by the parochial secular princes, who might have been kept within bounds by the oecumenical authority of a Pope in Council, but who now found an easy prey in a Pope who alienated and disillusioned the *Plebs Christiana* by recklessly setting his own will to power against the people's yearning for reform and relief. The Papacy had rebuffed the Conciliar Movement as Rehoboam once rebuffed the congregation of Israel, and the same consequences followed.

'The king answered the people roughly, and . . . spake to them . . . saying: "My father made your yoke heavy, and I will add to your yoke; my father also chastised you with whips, but I will chastise you with scorpions." . . . So when all Israel saw that the king hearkened not unto them, the people answered the king saying: "What portion have we

¹ Cossa reigned as Pope John XXIII from 1410 to 1415; Borgia, as Pope Alexander VI, from 1492 to 1503. Mr. Barraclough objects that 'this moral judgement completely ignores the administrative (and other) capacities of the Borgia'; but *responde finem*.

² 'A hole to catch foxes in' was Pope John XXIII's exclamation when, on his disconsolate journey to Constance, he caught his first sight of the city lying in a hollow of the hills.

³ 'Far from preparing the way for a lasting improvement, the restoration period of the Papacy played its part in leading on to the subsequent situation. Its merit lay in its success in overcoming a number of defects and getting rid of a number of abuses. But this improvement was only a rally; it was not a cure. This comes out in the fact that from this time onwards the same measures had to be renewed again and again at relatively short intervals in regard to the same points. In spite of the warning lessons of the Schism, which had been thoroughly taken to heart at the Council of Constance, the task of striking at the root of the evil—i.e. combating the causes of the increasing deterioration of discipline—was perpetually being put off; and there was a long persistence in the mistaken idea that all defects and misdevelopments could be got rid of merely by issuing ordinances, without at the same time taking severer measures to ensure that such ordinances should be strictly carried out. There was not a total blindness to this inner contradiction; in the later reforms the appropriate means were often proposed, but they were never applied.'—Hofmann, *op. cit.*, vol. i, p. 16.

⁴ Psalm vii. 15.

in David? Neither have we inheritance in the son of Jesse. To your tents, O Israel. Now see to thine own house, David". So Israel departed unto their tents"¹—

and in every tent they found some Henry Tudor who was eagerly waiting for his opportunity to play Jeroboam's part. It was by licence of the disillusionment of a popular feeling which had tried and failed to rally round the Papacy in the Conciliar Movement that the parochial princes could venture with impunity, a century later, to rise up against the Papacy and despoil it.²

The losses of power that were inflicted on the Papacy in the sixteenth century were staggering.

As an Italian territorial sovereign the Pope now saw himself dwarfed, as hopelessly as his peers the Grand Duke of Tuscany and the Signoria of Venice, by the rising Transalpine and Transmarine Powers.³ It was in vain that he had welded Tivoli and Viterbo onto Rome, and Umbria and the Marches onto the Agro Romano, and the Legations onto the Marches. A Papal principality which had extended itself from the Tyrrhene Sea to the Adriatic and from the Garigliano to the Po might be a Great Power in Italy, but it was a pygmy in a new world which contained the France of Louis XI and the England of Henry VII and the Spain of Ferdinand and Isabella.⁴ After attempting to strut in arms on this giant's stage, and exposing itself to such humiliating experiences as its war of A.D. 1556-7 with King Philip II of Spain, the Papacy learned the lesson which Athens learned in the Chremonidean War,⁵ and withdrew as far as possible from active participation in an international war-game which it had found too boisterous.⁶ But this tardy Papal recognition of the drawbacks of territorial sovereignty did not save Pope Innocent XI from being bullied by Louis XIV or Pope Pius VII from being dragged at the chariot-wheels of Napoleon.

While the Pope suffered this fate as an Italian secular prince, he suffered still more grievous misfortunes as the oecumenical sovereign of the Western Church. In this latter capacity he saw the

¹ 1 Kings xii. 13-16.

² 'It is the lack of feeling on either side—and notably on the royal side—which is the startling thing about Henry Tudor's "reformation". Indifference not only where indifference was to be expected, but where indifference should not have been—that is the key-note, and that is the failure of the Papacy (before Trent): that it produced, not feeling—even hostile feeling—but indifference'.—Mr. G. Barraclough in a letter to the writer.

³ For this dwarfing of the Italian states by the Italianized Powers of an outer circle see III. C (ii) (b), vol. iii, pp. 299-305, above.

⁴ On this point see III. C (ii) (b), vol. iii, pp. 356-7, above.

⁵ See III. C (ii) (b), vol. iii, pp. 338 and 340, above.

⁶ The withdrawal of the Papal principality into a position of persistent neutrality in the seventeenth century was an anticipation of the policy which was adopted in the nineteenth century by the surviving small states of Western Europe: Switzerland, Belgium, Holland, and the Scandinavian Kingdoms.

whole of his power reft away from him in the states that turned Protestant, and four-fifths of it in those that professedly remained Catholic—for their Catholic Majesties were not less rapacious than their Protestant Majesties in robbing the Papacy of its powers for their own benefit; the only difference in their policy was that they left the Papacy in possession of that fraction of its powers which, in the countries that turned Protestant, was abandoned by the prince to his subjects as a prison-yard exercise-ground for the individual conscience.

These sixteenth-century blows were the nemesis of the Papacy's fifteenth-century relapse into *ὑβρις*; but they were also the stimulus of a sixteenth-century revival.¹ In this extremity the Catholic Church was snatched from the jaws of destruction by the very present help² of a band of saints who utterly eclipsed the respectable but prosaic fathers of Constance and Basel, and whose like had not been seen in Western Christendom since Saint Louis had died in 1270 on the last crusade and Saint Thomas in 1274 on his way to the Council of Lyon. Saint Ignatius Loyola (*vivebat* A.D. 1495–1556)³ captured the intellectual prowess of Italy, which had ministered to a Papal pride of life when a Giovanni de' Medici was reigning as Pope Leo X,⁴ and bent it to the service of reform by yoking it with a Janissarian discipline.⁵ Saint Teresa (*vivebat* A.D. 1515–82) and Saint John of the Cross (*vivebat* A.D. 1542–91) restored the lapsed austerities of the Carmelite Order and found their way through this door into a new world of mystical illumination. Saint Philip Neri (*vivebat* A.D. 1515–95) set a new standard of loving-kindness towards the poor and the sick, and a new standard of devotion for the ministry of secular priests. Saint Charles Borromeo (*vivebat* A.D. 1538–84) wholly succeeded, where Pope Innocent III had half failed,⁶ in performing the exacting task of an ecclesiastical administrator. Saint Francis de Sales (*vivebat* A.D. 1567–1622) was as intrepid a missionary of the Catholic Faith in the Protestant lion's den at Geneva as Saint Francis Xavier (*vivebat* 1506–52) was among the heathen in the Indies. These super-human men and women worked a work in our Western World which is still operative to-day and which has perhaps not

⁵ The first General of the Society of Jesus, when he organized his spiritual army, anticipated the secular princes of the West by more than a century in rivalling the discipline of the Ottoman Pādīshāh's Slave-Household. A contemporary 'Osmanlı might have described the Jesuits as the *qullar* of the Patriarch of Rome.

⁶ See the present chapter, pp. 557–63, above, and IV. C (iii) (c) 3 (β), Annex, pp. 652–6, below.

yet begun to bear its richest fruits. In their own age, however, (if it is not sheer nonsense for historians to pin down saints within temporal bounds), the dead weight of the Papal tradition brought the sixteenth-century saints' impetuous advance to a premature halt. They liberated the Papacy from the pride of life, but its lust for power proved too strong for them; and so the sixteenth-century rally failed, after all, to save the day. In the seventeenth century the Roman Church relapsed into a spiritual torpor which awoke into a counter-revolutionary activity—both political and intellectual—when it was stirred by the impact of an eighteenth-century Philosophy and a nineteenth-century Physical Science; and by the three hundredth anniversary of Saint Ignatius's death a Papacy which had once been the heart of the Western body social seemed to have become an atrophied member, in which the blood no longer coursed and the life no longer throbbed. The pontificate of Pius IX (*fungebatur* A.D. 1846–78), who saw the territorial sovereignty of the Papacy extinguished when the armed forces of the Kingdom of Italy entered Rome in 1870, marked as abysmal a fall in the fortunes of the Holy See as the pontificate of Clement VII (*fungebatur* A.D. 1523–34), who saw Rome sacked in 1527 by the Protestant mercenaries of the Emperor Charles V, or the pontificate of John XXIII (*fungebatur* A.D. 1410–15), who was brought to book at Constance.

As we read this tale of rout and rally and relapse which brought so great an institution so low in the course of some six hundred years, we shall be struck by a series of signal failures to learn from experience. Hildebrand himself, who had obtained his opportunity because the Emperor Henry III had overplayed a strong hand in 1046, made precisely Henry III's mistake when, thirty years later, he overplayed his own strong hand in dealing with Henry IV. Innocent III, as we have seen, was not deterred by the deplorable outcome of the Fourth Crusade from launching his crusade against the Albigenses with equally deplorable consequences; and the exposure of his credulity towards Otto Welf did not put him on his guard against Frederick II. Innocent IV did not perceive that the Holy See would be as much at the mercy of a King of Sicily who was brother to the King of France as it had been at the mercy of a King of Sicily who was himself the King of Germany—though the essential danger lay in being taken between two fires, without its making any substantial difference whether the Transalpine fire was German or French. Boniface VIII did not apprehend that if an insistence upon legal pretensions insufficiently supported by material power had been fatal to the Emperor Frederick I in his dealings with the Lombard communes, it would be equally fatal to

580 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
Pope Boniface in dealing with the Kingdom of France. A Martin V and a Eugenius IV, when they set themselves to frustrate the Conciliar Movement, did not remind themselves that King Philip IV of France and King Edward III of England had deliberately fortified themselves with parliamentary support before their successful defiance of the Papacy in the fourteenth century, and therefore did not draw the statesman-like inference that an oecumenical parliament of the Western Ecclesiastical Commonwealth, so far from being a menace to the Pope's authority, was likely to be a tower of strength to him in a coming struggle with the parochial secular princes. A Julius II did not reflect that a pagan virtuosity in arts and arms, which had not saved from destruction the Papacy's arch-enemy Frederick II, was unlikely to bring salvation to the power by which Frederick had been conquered. And, in general, the experience of the Papacy in the fifteenth and sixteenth centuries in its encounters with the Renaissance and the Reformation did not make it any the more expert in dealing, in the eighteenth and nineteenth centuries, with the new forces of Democracy and Physical Science which had been generated by a fresh eruption of the Western social volcano.

As we contemplate this record of flood-lit truths unheeded and golden opportunities untaken, we cease to wonder at the unparalleled series of calamities by which the Hildebrandine Papacy has been afflicted in the long agony of its decline and fall: 'the Babylonish Captivity,' the Great Schism, the Protestant Reformation, the Italian *Risorgimento*. Are these the final fruits of the tree which Hildebrand planted? If so, the nemesis of creativity surpasses itself when it takes the form of the intoxication of victory.

The tragedy of the Hildebrandine Papacy is the tragedy of Periclean Athens. Athens became the oppressor of her sister city-states whom she had liberated from the oppression of the Achaemenidae; the Roman See became the oppressor of her sister churches whom she had liberated from the oppression of the Secular Power in Western Christendom. In both tragedies the protagonist inverts his role; in both, the change is the outward visible sign of an inward spiritual débâcle; and, in both, this mortal sin is visited with a condign punishment. In the Hellenic drama the devastation which the sin and the punishment deal does not stop short at the affliction of the victims and the abasement of the villain of the piece; it takes its course until it brings about the breakdown of the whole civilization in whose life the actors are playing their parts. In our Western drama, in which we ourselves are actors as well as spectators, are the sin and punishment of the Hildebrandine

Papacy destined to bring the history of Western Christendom to the same tragic ending?

As we gaze round our spiritually devastated world in our generation, we can take the measure of the evil which has been brought upon us by the Hildebrandine failure now that its consequences have had nearly seven centuries to work themselves out since Innocent IV fought his Hannibalic War. And in the light of this latter-day knowledge we can see that the Hildebrandine Papacy's greatest crime against our Western Society has been, not its extermination of the Hohenstaufen or its assassination of the Conciliar Movement, but its felony against itself. In committing those crimes the Papacy did its best to commit suicide; and in dealing itself this prostrating blow it has left the house vacant for the entry of seven—and seventy times seven—other spirits who are all more wicked than the supplanted householder.¹ In the four hundred years that have now been added to the tale of Western history since the outbreak of the Reformation the sins of Jeroboam have far surpassed the sins of the degenerate scion of David's house who gave the usurper his chance to seize nine-tenths of the Kingdom.

'And Jeroboam said in his heart: "Now shall the kingdom return to the house of David. If this people go up to do sacrifice in the house of the Lord at Jerusalem, then shall the heart of this people turn again unto their lord, even unto Rehoboam King of Judah; and they shall kill me and go again to Rehoboam king of Judah." Whereupon the king took counsel and made two calves of gold, and said unto them: "It is too much for you to go up to Jerusalem; behold thy gods, O Israel, which brought thee up out of the Land of Egypt." And he set the one in Bethel, and the other put he in Dan. And this thing became a sin. . . .'²

The golden calves which our latter-day Jeroboams have set up in our Western World are called 'totalitarian states'; and these are the gods which they invite—nay, command—us to worship in place of the God of Benedict and the God of Gregory and the God of Hildebrand and the God of Francis. To-day these false prophets of an odious idolatry³ sit in Hildebrand's seat. But their

² 1 Kings xii. 26-30.

³ The disastrousness of the sequel to the breakdown of our medieval Western Papal hierarchy is underlined by Auguste Comte in his *Considerations on the Spiritual Power* (reprinted from his *Système de Politique Positive*, vol. iv (1854), Appendix, in *Early Essays on Social Philosophy*, translated from the French of Auguste Comte by H. D. Hutton, second edition (London, no date, Routledge)):

'Of all the revolutionary prejudices which have sprung up during the last three centuries owing to the decline of the old social system, the most ancient, the most deeply rooted, the most generally accepted, the one that lies at the root of all the rest, is the principle which proclaims that no spiritual power should exist in Society, or, what comes to the same thing, that this power should be entirely subordinated to the Temporal Power' (op. cit., p. 283).

Comte goes on to point out (op. cit., pp. 285-7) that in international relations the

582 THE CAUSE OF THE BREAKDOWNS OF CIVILIZATIONS
mandate is not inexhaustible, and, by the same token, our own doom is not sealed.

The cup of these usurpers' iniquities has run over in a generation which has seen the Papacy drink its own cup of humiliation to the dregs. On the 20th September, 1870, the wheel of Destiny completed its Great Year by coming round, full circle, to the pre-Hildebrandine situation of the 20th December, 1046. In the long flood of adversity the *v̄βpis* that was the Holy See's undoing has perhaps at last been washed away, and already history has begun to repeat itself. When the blow which was dealt to the Roman Church by a militant Italian nationalism in 1870 was immediately followed in a militantly nationalist Germany by the launching of the *Kulturkampf*, it almost seemed as though the last hour had struck for the Catholic Faith; yet that bloodless war of attrition on German soil ended in the first victory which the Church had gained for three hundred years—and this in a conflict with Bismarck, the most redoubtable Jeroboam of the age. Nor was the Catholic Church defeated in the struggle with state-worship in France which broke out in 1904. So far from that, it was becoming apparent in the fourth decade of the twentieth century that in France the future lay, not with the anti-religious ideas in the Ideology of 1789, but with the spiritual influence of the lives of a nineteenth-century band of saints whom the challenge of the French Revolution had called into action in France and Piedmont, as the sixteenth-century saints had been called into action in Spain and Italy and Savoy by the challenge of the Reformation.¹ In Saint Jean-Baptiste Vianney, the curé d'Ars (*vivebat* A.D. 1786–1857), there was an epiphany of sainthood in the life of a parish priest; in Don Giovanni Bosco (*vivebat* A.D. 1815–88) there was an epiphany in the life of a 'social worker'; in Saint Bernadette Soubirous of Lourdes (*vivebat* A.D. 1844–79) there was an epiphany in the life of a child of the Proletariat; in Saint Thérèse Martin, 'the Little Flower' (*vivebat* A.D. 1873–97), there was an epiphany in the life of a child of the Bourgeoisie. This outburst of sainthood in the continental strongholds of a nineteenth-century secularism was the movement

Papal authority has been replaced by nothing but a Balance of Power between parochial secular governments, and (op. cit., pp. 288–95) that, within the bosom of each parochial community, the fruits have been a mental anarchy, a lack of public morality, a social materialism, and a corrupt bureaucracy. He damns the Holy Alliance with faint praise (op. cit., p. 328, footnote 1) as a *pis aller*, which is not quite so bad as the Balance of Power, in a society that has not succeeded either in preserving the Spiritual Power or in restoring it.

For Comte's advocacy of the separation of the two powers see further Caird, E.: *The Social Philosophy and Religion of Comte* (Glasgow 1885, MacLehose), pp. 47–8 and 210–11. Comte saw clearly (Caird, op. cit., pp. 44 and 51) that the Spiritual Power could only exercise its own proper function on condition of resisting all temptations to resort to direct action in the temporal sphere.

¹ See p. 578, above.

from the depths which was reflected on the surface of life in the successful resistance of the Church, as an institution, to the assaults of the German state *post* 1871 and of the French state *post* 1904. In the year 1938 it looked as though the victor in those preliminary skirmishes were now going into action in a pitched battle in which the whole strength of either side might be engaged; and in this conflict, if it was indeed at hand, the fate of Western Christendom would once more be in the balance.

At this hour of decision it is meet and right that all men and women in the Western World who 'have been baptized into Christ' as 'heirs according to the promise'¹—and, with us, all the Gentiles who have become 'partakers of' the 'promise' and 'fellow heirs of the same body'² through the adoption of our Western way of life—should call upon the Vicar of Christ to vindicate the tremendous title which Pope Innocent III has bequeathed to subsequent successors of Saint Peter. Did not Peter's Master say to Peter himself that 'unto whomsoever much is given, of him shall be much required, and to whom men have committed much, of him they will ask the more'?³ To the Apostle at Rome our forefathers committed the destiny of Western Christendom, which was the whole of their treasure; and when 'that servant, which knew his Lord's will', 'prepared not himself, neither did according to his will,' and was beaten, in just retribution, 'with many stripes',⁴ those blows fell with equal weight upon the bodies of 'the menservants and maidens'⁵ whose souls had been entrusted to the keeping of the *Servus Servorum Dei*.

Quidquid delirant reges plectuntur Achiivi.

ANNEX TO IV. C (i)

WHICH ARE THE TRUE CATASTROPHES: THE BREAK-DOWNS OF CIVILIZATIONS OR THEIR BIRTHS?

IN the passages of Plato that we have quoted in the chapter to which this Annex attaches, there is a noteworthy discrepancy between the *Laws* and the *Timaevs* on the one hand and the *Politicus* on the other.

The passage from the *Politicus* agrees with the passages from the *Laws* and the *Timaevs* in the assumption that the fortunes of Mankind are bound up with the vicissitudes of Physical Nature and that these two co-ordinated series of physical and human events move in a cyclic alternation of prosperity and adversity. It differs from them, however, in its philosophy of human history. According to the *Laws* and the *Timaevs*, the prosperous phases of human history are those which, in this Study, we have called the growth-phases of civilizations, and it is these growths of civilizations (which are conceived as desirable) that are disastrously cut short by the periodic cataclysms. According to the *Politicus*, on the other hand, the prosperous phases of human history correspond to what, in this Study, we have called the static Yin-state of primitive societies¹—idealized into an ἐνὶ Κρόνου βίος.

'When God was shepherd, there was no state and no ownership of women and children. . . . All the historical conditions of life were absent, while on the other hand they enjoyed fruits in abundance from trees and other plants, which were not the product of cultivation but were raised spontaneously by the Earth herself. For the most part they camped in the open without clothes or bedding, the climate having been tempered so as to do them no injury, and they found soft couches in the grass which was produced by the Earth in abundance.'²

According to the *Politicus*, moreover, it was this state of Nature—which was likewise a state of Grace—that was brought to an end by the abrupt reversal of direction in the rotatory motion of the Cosmos at the moment when the divine helmsman let go his rudder;³ and the sinister change in human fortunes which was involved in this cosmic catastrophe was not the change from the growth of a civilization to its breakdown but was the antecedent transition to the genesis of a civilization from the static condition of a primitive society in its Yin-state. In other words, the recurrent

¹ See Part II. B, vol. i, pp. 192-5, above.

² Plato: *Politicus*, 271B 5-272A. Compare the *Tao Te King*, chap. 80.

³ See IV. C (i), pp. 26-7, above.

calamity that overtakes Mankind is not the breakdown of civilizations but their outbreak.

Consistently with this philosophy of history the births and growths of civilizations are explained in the *Politicus* as the response of Mankind to the challenge of the abandonment of the Cosmos by God.

'When Mankind had been deprived of the care of the Spirit who had been our shepherd, the majority of wild beasts that were fierce by nature turned savage, while Man himself became weak and defenceless. In consequence he was harried by the wild beasts, and in this first phase he was destitute of all equipment and resources, since his spontaneous food-supply had failed before he had been taught, by the stress of necessity, to provide for himself. For all these reasons Man found himself in the direst straits, and this is the origin of those legendary Gifts of the Gods with which we have been presented, together with the instruction and training necessary for the use of them—fire from Prometheus, the arts and crafts from Hephaestus and his consort, and seeds and plants from other benefactors. Every stone in the foundations of human life has been hewn from this quarry. The watch (aforementioned) which had been kept over Man by the Gods had now suddenly failed, and Man was forced to live by his own efforts and to keep watch over himself, exactly like the Cosmos as a whole, with which we are ever partakers in its imitation and following of God through all the alternating phases of our own life and growth.'¹

According to the philosophy of the *Politicus* this heroic achievement of Human Civilization, in response to the challenge of Man's desertion by God, is—and can be—nothing but a forlorn hope. 'What God abandoned, these defended'; but the human defences are doomed to fall, because the Cosmos 'always performs its functions best during the phase least far removed from its release', while, 'as time goes on, the . . . original disharmony begins to gain the upper hand, until in the final phase it breaks out openly'.² Ultimately Mankind is saved, not by Man's own efforts, but by a fresh intervention of God—an intervention which is as abrupt and as arbitrary as His original withdrawal. And God saves Man by winding the painful attempt at Civilization up and bringing Human Society back to the blissful primitive level.

On this showing, the attempt at Civilization is not the quest of an attainable and desirable goal, but is at best a creditable *pis aller*. On the other hand in the *Latos* (in the immediate sequel to the passage quoted on p. 24, above) and in the *Timaues* (in the passage above-quoted on pp. 24-5) the births and growths of

¹ Plato: *Politicus*, 274 B-D.

² The passage of the *Politicus* in which these sentences occur has been quoted in the present volume, on p. 27, above, in the chapter to which this Annex attaches.

civilizations, though they are described in much the same terms, are placed in a radically different setting. Instead of being represented as responses to the challenges of cosmic catastrophes, they are represented as following these catastrophes only after vast intervals of time, when the survivors of the catastrophes begin at last to recover from their prostration and stupefaction. Instead of being represented as a *pis aller* and a forlorn hope, these eventual new stirrings of life are assumed to be both admirable and promising endeavours. And instead of being cut short, when they have reached the brink of a disaster, by a beneficent intervention of God which makes all things new by making all things primitive again, these promising endeavours are cut short, when they are on the verge of achievement, by a cruel cataclysm which sweeps away the cumulative results of social progress and brings Man down again to a primitive level which is regarded, in these dialogues, as a state of Nature which is not a state of Grace but a state of Savagery. The difference between the two philosophies may be summed up by saying that the human disaster which the cosmic catastrophe entails is the destruction of civilizations according to the *Laws* and the *Timaeus*, and the perpetration of civilizations according to the *Politicus*. The attempt at Civilization, which is the one philosophy's good, is the other philosophy's evil.

It will be seen that the philosophy of the *Politicus* is identical (apart from the cyclic element) with that of the Syriac myth of the Fall of Man as this is presented in the Book of Genesis, where the state of Nature in the Garden of Eden is regarded as a state of Grace, while Man's response to the challenge of expulsion from the Garden—the response in which he builds up a civilization in the sweat of his brow—is regarded as the working out of a perpetual sentence of penal servitude: a sentence imposed upon Man as the penalty for the sin of disobedience on account of which he has been expelled from the Earthly Paradise.

It will also be seen that it is the Plato of the *Politicus* rather than the Plato of the *Laws* and the *Timaeus* whom Virgil follows in the Fourth Eclogue, when he represents the whole history of the Hellenic Civilization as a criminal aberration from which a long-tormented Humanity is now to be released at last through a return to an idealized state of Primitive Nature:

Te duce, si qua manent sceleris vestigia nostri,
irrita perpetua solvent formidine terras . . .
ipsae lacte domum referent distenta capellae
ubera, nec magnos metuent armenta leones . . .
molli paulatim flavescet campus arista,
incultisque rubens pendebit sentibus uva,

et durae quercus sudabunt roscida mella . . .
cedet et ipse mari vector, nec nautica pinus
mutabit merces: omnis feret omnia tellus.
non rastros patietur humus, non vinea falcem;
robustus quoque iam tauris iuga solvet arator.¹

So much for the contradiction in the minds of the philosophers and poets of the Hellenic breakdown and disintegration. But we, in our world and our generation, assuredly cannot be content simply to take note of this contradiction and to leave it unresolved; for it raises a problem which concerns us to-day as deeply as it once concerned a Plato and a Virgil. We shall return to this problem at a later point.²

¹ Virgil: *Eclogue* IV, ll. 13-14, 21-2, 28-30, 38-41.

² In Part VII, below.

THE TRANSADRIATIC EXPEDITION OF THE EMPEROR
CONSTANS II AND ITS ANTECEDENTS IN HELLENIC
HISTORY

As the memories of childhood reawaken in old age in the consciousness of a human being, so, in the life of a human society, there is sometimes a repetition, in the last chapter of its decline and fall, of some situation which has occurred in its history once already in an earlier chapter. With this clue to guide us we may detect a parallelism between the Emperor Constans II's expedition in the seventh decade of the seventh century of the Christian Era from the latter-day capital of a moribund Hellenic universal state¹ to the remnant of its Transadriatic dominions and a previous series of expeditions from the homelands of the Hellenic Society to its Transadriatic colonial annexes which were undertaken successively by Timoleon of Corinth in 344 B.C.² and King Archidamus of Sparta in 342 and King Alexander of Epirus in 333 and Prince Cleonymus of Sparta in 303 and King Pyrrhus of Epirus in 280-274.³

This ancient series of Greek military expeditions from east to west of the Adriatic had an object which, *mutatis mutandis*, was identical with Constans' object a thousand years later. Constans set out to rescue the Province of Sicily, and the other relics of the Exarchates of Italy and Africa, from the doom with which they were threatened by the simultaneous aggression of the Arabs in Africa and the Lombards in Italy; the Corinthian and Spartan and Epirot knight-errants who led the Hellenic 'crusaders' of the fourth and third centuries B.C. came to defend the colonial Greek communities in Sicily and Magna Graecia against a similar attack on two fronts: a Carthaginian attack in Sicily and an Oscan attack in Italy which was delivered in successive Bruttian and Lucanian and Samnite and Roman waves.⁴ On the earlier occasion the enterprise failed irretrievably after five attempts; and we may suppose

¹ The transference of the centre of gravity of the Roman Empire from Rome to Constantinople in the course of the fourth and fifth centuries of the Christian Era is an instance of the general 'law' that the governing power in a universal state first arises on the periphery of the world which the universal state embraces, and then gravitates towards the centre as time goes on. This 'law' is illustrated and discussed in Part VI, below.

² See V. C (ii) (a), vol. vi, pp. 248 and 251, below.

³ All these earlier Hellenic knight-errants in the west except Timoleon made their first landing, like the Emperor Constans, at Tarentum.

⁴ For this South Italian front of Hellenism and its elimination see further V. C (i) (c) 2, vol. v, pp. 213-4, below. The analogy between the Beneventan Lombards and the Samnites is drawn in Gay, J.: *L'Italie Méridionale et l'Empire Byzantin, 867-1071* (Paris 1904, Fontemoing), p. x.

that it would have failed ultimately likewise upon its repetition a thousand years later—even if Constans had lived out his life to its natural term and found successors to carry on his policy—since the factors which were the manifest causes of the failure in the fourth and third centuries B.C., when the experiment was tried out to the bitter end, were also in operation in the seventh century of the Christian Era, when the repetition of the experiment was cut short after a trial of no longer than six years' duration.

On the earlier occasion the enterprise failed for four distinct reasons. In the first place the Western Greeks were heavily out-matched by their assailants; in the second place their champions from the Greek homelands were unable to bring over with them large enough forces to redress the balance; in the third place the effectiveness of the reinforcements, such as they were, was diminished by a lamentable lack of cordiality in the co-operation between the knight-errants and their protégés; in the fourth place the relieving forces were distracted and dissipated by being called upon to intervene on two different fronts simultaneously. All these adverse factors reappear in the local situation as it stood in the seventh century of the Christian Era. For example, Constans found himself just not strong enough to subjugate the Lombard principality of Benevento, as Alexander of Epirus had once failed, by a comparably narrow margin, to subjugate the Samnite Confederacy; and Constans, had he lived, would assuredly have quarrelled with his principal Italian protégée the Papacy,¹ as Alexander of Epirus did live to quarrel with his principal Italian protégée the city-state of Tarentum.

On the earlier occasion perhaps the most potent of all the factors that militated against success was the sheer inferiority of the Western Greeks to their ring of assailants in weight of numbers and extent of territory. The Greek communities in Sicily were so far alive to the danger to which they were exposed by this numerical weakness that, time and again, they submitted to the surrender of their parochial autonomy and their civic liberty for the sake of pooling their resources.² Yet, although they distinguished themselves by this readiness—which was a rare virtue in the Hellenic World—to pay the necessary price for the benefits of solidarity, the strength which the Sicilian Greeks found in their unity under the successive despotisms of the Deinomenidae and the Dionysii and Agathocles and Hiero was still not enough to save them in the end

¹ The protracted martyrdom which had been inflicted by Constans upon Pope Martin from A.D. 653 to A.D. 655 must have been perpetually in the mind of Martin's successor, Pope Vitalian, during the Emperor's twelve days' visit to Rome in A.D. 663.

² For this recurrent and characteristic feature of Sicilian Greek history see III. C (ii) (b), vol. iii, p. 357, footnote 1, above, and V. C (ii) (a), vol. vi, p. 183, below.

from being trampled under foot when their island became the battleground of the Carthaginians and the Romans. In this final struggle for supremacy in the Western Mediterranean, in which the victor's prize was the privilege—and burden—of becoming the founder of a Hellenic universal state,¹ the Sicilian Greeks were not in the running.² On this showing we may conjecture that, even if Constans had lived on long enough in Sicily to repeat the performance of those ancient Sicilian Greek empire-builders, his building could not have withstood for long the shock of successive Arab and Berber and Lombard and Frankish assaults. In the seventh century of the Christian Era Syracuse had really no more chance of supplanting Constantinople as the last capital of the Hellenic universal state than she had had of becoming its first capital, instead of Rome, in the third century B.C. From the beginning to the end of Hellenic history Sicily was never at any time capable of providing the basis for a Hellenic world power.

In fine, we may conclude that if either Constans or his grandfather Heraclius had succeeded in carrying out their plan they would have erased, once for all, the last faint shadow of an Imperial Government at Constantinople, but this without succeeding in replacing it by any substantial or enduring Imperial Government at Carthage or Syracuse or Ravenna.

¹ *Omnia cum belli trepido concussa tumultu
horrida contremuere sub altis aetheris oris,
in dubioque fuere utrorum ad regna cadendum
omnibus humanis esset terraque marique . . .*

Lucretius: De Rerum Natura, Book III, ll. 834-7.

² In the third century B.C. the Sicilian Greek Power of Hiero and Hieronymus was as utterly outclassed by Carthage and Rome as in the sixteenth century of the Christian Era Venice and Milan were outclassed by France and Spain and the Danubian Hapsburg Monarchy (see III. C (ii) (b), vol. iii, p. 357, above).

THE ABORTIVE RESISTANCE OF THE CHURCH TO THE REVIVAL OF 'CAESARO-PAPISM' IN ORTHODOX CHRISTENDOM

IN the chapter to which this Annex attaches, we have noted that in Western Christendom the Church eventually asserted its supremacy over the Temporal Power, and that, in successfully enforcing this pretension in the second chapter of our Western history, the Papacy performed a creative act which enabled our Western Civilization to proceed a stage farther in its growth.¹ In the same connexion we have seen that in Orthodox Christendom the Church succumbed to a pretension on the part of the Temporal Power to possess and exercise the 'Caesaro-papal' authority which had once been wielded in a Christian Roman Empire by a Constantine the Great and a Justinian,² and that this defeat of the Orthodox Church by the East Roman Government is to be regarded, in the history of the society in which both these institutions lived and moved and had their being, as a social aberration which was demonstrably responsible for this Orthodox Christian Society's premature breakdown. For an observer, in retrospect, of these accomplished facts it is a tempting exercise of his historical judgement to summon the Orthodox and the Western Church before his mental judgement-seat, hold a summary inquiry into their respective records in these two historic transactions, and render a comparative verdict eulogizing the Western Church in the measure of its *de facto* success and conversely censuring the Orthodox Church in the measure of its *de facto* failure. Such a verdict would be as injudicious as it is facile, and we must be vigilantly on our guard against being seduced into accepting it.

To put ourselves on our guard we may remind ourselves of the simple fact that the generation of Hildebrand is separated by a Time-span of not much less than six hundred years from the generation of Odovacer, and that, throughout this long period which intervened between the *de facto* break-up of the Roman Empire in the West and the initiation of a deliberate endeavour to establish a Papal *Respublica Christiana*, the persistent policy of the Papacy was to replace itself under an Imperial tutelage from which it had been liberated against its will by *force majeure*.³ At first the Papacy had clung forlornly to the skirts of a still surviving Imperial Government at Constantinople, and then—when the rotten fringe

¹ See IV. C (iii) (c) 2 (β), pp. 339 and 405, above.

² See *cap. cit.*, pp. 346-53, above.

³ See *cap. cit.*, pp. 335-9, above.

of the worn-out Byzantine *scaramangium* tore away in the Papal suppliant's desperately clutching hands—a Pope Stephen II (III) had gone in search of a substitute-protector beyond the Alps, and a Pope Leo III had invested this barbarian *deus ex machina* with a robe of office which was fondly expected to wear better because it was a counterfeit, woven of coarser stuff than the genuine Imperial silk. This chapter in the history of the Papacy is neither inspiring in itself nor prophetic of the magnificently creative chapter which actually followed. And our observation of this vein of unexpectedness in the course of our Western ecclesiastical history should warn us, when we come to pass judgement on the Orthodox Church, against hastily jumping to the conclusion that, just because the Orthodox Church succumbed to the Temporal Power, it must have brought this fate upon itself by offering its neck poor-spiritedly to the yoke. As a matter of fact we shall find, upon examination, that the Church which was defeated by a Leo Syrus and a Leo Sapiens fought as good a fight as the Church which was victorious over a Henry IV and a Frederick Barbarossa.

The Orthodox Church which was challenged to prove its mettle by a revival of 'Caesaro-papism' in the eighth century had inherited from the Primitive Christian past as fine a tradition of resistance to the Imperial Power as any of which the West could boast. During the struggle of the Primitive Church with the Pagan Empire the Christian martyrs in the Greek and Oriental provinces had been as numerous and as valiant as in the Latin;¹ and in the ensuing Post-Constantinian Age, when the Church had been almost lulled to sleep on the Empire's bosom² and had not yet experienced the rude awakening which was destined to overtake her upon the Empire's imminent death and dissolution, the rather rare examples of clerics who went into opposition against the Christian Imperial Power include Greeks and Orientals³ as well as 'Hesperians'. The

¹ In absolute numbers the Greek and Oriental martyrs were far more numerous, no doubt; but these absolute numbers, if we knew them, would have to be reduced to the percentage which they represented of the total Christian community in the different regions, and down to the generation of Constantine, at any rate, the Christian community in the Latin provinces was in itself a smaller portion of a smaller total population than the Christian community was in the other two-thirds of the Empire. Even on this proportional basis, however, there is reason to believe that the toll of martyrdoms in the Greek and Oriental provinces was at least as heavy as in the Latin provinces, relatively to the difference in the respective absolute numbers of possible candidates for martyrdom in the different regions.

² See IV. C (iii) (c) 2 (β), pp. 349–50, above.

³ In the Oriental provinces of the Roman Empire the fifth century saw the Nestorian and Monophysite mass-movements against the 'Melchite' adherents of the Imperial Catholic Church. These movements, however, were endeavours, not so much to free the Church from the domination of the Temporal Power, as to free the still submerged portion of the Syriac World from the Hellenic ascendancy to which it had been subject since the days of Alexander the Great. (For this aspect of Nestorianism and Monophysitism see I. C (i) (b), vol. i, p. 91; II. D (vi), vol. ii, p. 236; and II. D (vii), vol. ii, pp. 286–7, above, and V. C (i) (c) 2, vol. v, p. 127, below.)

insistence of Ambrose that Theodosius the Great should do public penance for the sin of the Salonica Massacre was certainly a magnificent display of clerical courage which happened to be crowned with success. Yet the Bishop of Milan's successfully courageous act in calling Theodosius to account is not more worthy of admiration than the unsuccessful bravery of a justly famous Patriarch of Constantinople in publicly protesting against the misdemeanours of Theodosius's son and successor Arcadius. Indeed, we may be inclined to appraise John Chrysostom's defeat at a higher moral value than Ambrose's victory when we bear in mind the difference in the temperaments, endowments, and antecedents of the two saints. Ambrose—the son of a Praetorian Prefect, and himself already launched upon a promising career in the Imperial service before the people of Milan commandeered him for their bishop by main force—was a man of action of the same mettle as Theodosius himself; John Chrysostom was a scholar who would have led the sheltered life of a professor of literature if the dedication of his eloquence to the cause of Religion had not moved his conscience to go into action in the field of public life and inspired him with the faith to endure the pains of defeat in what was for him a strange and formidable arena. We may also remind ourselves that Saint John's see of Constantinople was not merely an Imperial capital but was essentially that and nothing else; for an interregnum of more than a hundred years' length effectively insulated the traditions of the New Rome founded by Constantine the Great in A.D. 330 from those of the ancient Greek city-state of Byzantium which had been devastated, and deprived of its statehood, by Septimius Severus in A.D. 196. On the other hand Saint Ambrose's see of Milan was a *ci-devant* city-state which had preserved its sense of continuity with its own past in spite of being used as an Imperial capital temporarily and provisionally. It is clear that Saint Ambrose would be fortified by his social environment in his resistance to the Imperial Power, while Saint John, on the contrary, would be weakened by his.

If we leap the interregnum which follows the break-up of the Roman Empire, and proceed to examine the respective records of the Orthodox and the Western Church in the critical period that begins with the launching of the Iconoclastic policy of the East Roman Emperor Leo Syrus, we shall find that every famous Western champion of the rights of the Church has his counterpart and peer in Orthodox Christendom.

Pope Gregory II and his successors in St. Peter's Chair were not more stalwart in their opposition to Leo's Iconoclastic decree of A.D. 726 than the Oecumenical Patriarch Germanus, who held out

under the Emperor's nose until at the end of four years the Emperor could find no better means of countering this formidable intransigence than the *ultima ratio* of throwing the Patriarch out of office. If the Papal opponents of Iconoclasm were able to indulge in the same intransigence without incurring the same fate, this was simply because the rehabilitated Government at Constantinople had made up its mind that it could not afford to take energetic action so far afield as Italy beyond the bounds of Calabria.¹ In retaliating against the Papacy Leo therefore contented himself with the forcible withdrawal, from the Pope's ecclesiastical jurisdiction, of all the eastern part of his former ecclesiastical domain from Calabria and Sicily to Crete and Salonica inclusive;² and these territories were transferred to the jurisdiction of the successors of Germanus at Constantinople, whom the Emperor expected to find more amenable to his will now that they had Germanus's fate before their eyes as a warning example of the penalty of clerical opposition to the 'Caesar-Pope' in the Imperial capital. Nevertheless, when Iconoclasm—repealed for a season by the Empress Irene (*imperabat* A.D. 780-90 and 797-802)³—was reinstituted by the Syrian Leo's Armenian namesake Leo V (*imperabat* A.D. 813-20), the indomitable Iconodule Patriarch Germanus found a worthy successor in the reigning Patriarch Nicephorus, who opposed Iconoclasm no less stalwartly, held out no less intransigently, and had likewise to be put out of the way by an eventual recourse to the *ultima ratio* of deposition. Nor was Nicephorus the only famous cleric of his generation in Orthodox Christendom who had the courage to suffer for opposing the Emperor Leo V's religious policy. He had good companions in Theodore of Studium (*vivebat* A.D. 759-826)⁴ and in Theodore's uncle Abbot Plato.

Thus the Oecumenical Patriarchate was at least as fearless as the Papacy in opposing an Iconoclast Imperial Government in act and deed, and this at a much greater material risk; and *a fortiori* the Orthodox Church outstripped the Western Church in fighting the same battle in the field of theological controversy, in which the

¹ For this East Roman policy of conserving energy and avoiding a dispersal of force see IV. C (iii) (c) 2 (β), pp. 342-4, above.

² See IV. C (iii) (c) 2 (β), pp. 337 and 346, footnote 2, above.

³ During her first term Irene was acting as regent for her son the Emperor Constantine VI; during her second term she was reigning as his supplanter. The date of the first repeal of Iconoclasm was 787.

⁴ Theodore of Studium appealed from the successor of Constantine to the successor of Peter. His policy was to find in the Papacy a rallying-point and a leadership for all the Iconodule forces in the East Roman dominions; and this policy was reasonable, since the Pope was the most powerful of the Iconodule Catholic Patriarchs who were not at the East Roman Government's mercy. Unhappily Theodore found the Papacy a broken reed; and this was perhaps inevitable, since the Papacy in Theodore's day was anxious, not to assert itself against the Temporal Power, but to take shelter under its wing (see IV. (iii) (c) 2 (β), pp. 335-9, above).

Latins were notoriously tiros and the Greeks past-masters. This war of ink and paper against Imperial Iconoclasm had, of course, to be conducted by a scholar in some tranquil retreat where he was beyond the reach of the East Roman Emperor's arm; but the historic *malleus iconoclastarum* was not a Latin doctor wielding his pen under the aegis of an Iconodule King of the Franks, but a Greek controversialist, John Damascene, whose patron and protector was a Muslim Umayyad Caliph.¹

After the resistance of Popes Gregory II (*fungebatur* A.D. 715-31) and Gregory III (*fungebatur* A.D. 731-41) to the Iconoclastic policy of the Emperor Leo Syrus the next signal occasion on which a Pope set himself in opposition to an Emperor was when Pope Nicholas I (*fungebatur* A.D. 858-67) refused to countenance the offence of King Lothaire II of Lorraine in repudiating his lawful wife in favour of another woman, and persisted in this refusal even when the Emperor Lewis II took up his kinsman's cause and sought to coerce the Pope by making a military demonstration against Rome. This is the earliest prominent example of one of the most honourable, as well as courageous, ways in which the Papacy, in its prime, was to assert its authority against temporal princes. Pope Nicholas I's bold motion to curb and castigate the licentiousness of Lothaire of Lorraine was rewarded, after a long struggle, by the capitulation of the royal culprit; and this passage of arms inaugurated a long series of victorious Papal assaults upon the matrimonial misdemeanours of princes—a series which was only brought to an end by Pope Clement VII's unlucky experience with King Henry VIII of England some seven centuries later. This long-sustained Papal *tour de force* of 'lion-taming' was, of course, a magnificent performance; for the Pope was utterly out-matched in physical force by the temporal rulers whom he so resolutely called to order; and yet, time and again, these wild beasts quailed under the spiritual coercion of an unarmed priest—snarling and lashing their tails at the first crack of the Papal whip, yet creeping up for pardon in the end with ears laid back and tails between their legs.² The forcefulness—and artfulness—of these Papal tamers of princes is admirable; and the performance is perhaps the

¹ It is perhaps worth noting that the three men—the Emperor Leo Syrus (*imperabat* A.D. 717-40), the Pope Gregory III (*fungebatur* A.D. 731-41), and the theologian John Damascene, *alias* Mansūr ash-Shāmi (*vivebat prae* A.D. 700 – *prae* 754)—who between them did so much to produce the schism between Orthodox Christendom and Western Christendom, were, all three of them, either Syrians or of Syrian origin, though Syria lay outside the domains of both the nascent civilizations whose destinies these three men were deciding. This trivial fact is a small but pointed nail in the coffin of the racial explanation of the histories of civilizations.

² The secret of the Papacy's apparently miraculous power of bringing temporal rulers to heel was, no doubt, the sensitiveness of public feeling and public opinion throughout the Western *Reipublica Christiana* in responding to Papal pronouncements and Papal acts. The temporal subjects of a local prince were all of them at the same time the

supreme demonstration of the medieval Papacy's moral and intellectual power. Yet we may observe that in exercising this moral censorship over the princes of Western Christendom, as in opposing the ritual and doctrinal innovations of the Iconoclast Emperors of Constantinople, the Papacy, while risking much, was not staking its very existence. The limitations of the risk involved were brought out in the final encounter in which one royal lion at last broke this Papal spell, and broke it for ever, by truculently refusing to obey. The militant contumacy of King Henry VIII cost the Papacy the allegiance of England, and this was certainly a serious blow; yet the wound thereby inflicted on the Holy See was patently very far from being a mortal one, for it was manifest, from first to last, that the Patriarchate of Western Christendom was not in danger of bleeding to death in consequence of the amputation of a couple of outlying archbishoprics.

We may now observe that the censorship of princely morals, which was exercised by the Papacy from Pope Nicholas I's time onwards in the tradition of Saint Ambrose, was likewise exercised—with equal fearlessness but, again, at a far greater risk—by the Oecumenical Patriarchate in the same age.

For example, Pope Nicholas I himself was moved to support his contemporary the Patriarch Ignatius, who had been deposed in A.D. 858 for his public protests against the evil living of the Caesar Bardas—the virtual master of the East Roman Empire at the time. Ignatius's stand against Bardas cannot be accounted less courageous or less admirable than Nicholas' stand against Lothaire simply because the East Roman Emperor Basil I managed to use Ignatius (without Ignatius's intention or connivance) as a pawn in his political game, whereas Nicholas managed to get the better of the clumsy and impotent Western Emperor Lewis II. In view of the

spiritual subjects of the Pope; and if their temporal ruler was rash enough to risk a conflict of allegiances he was likely to find that his subjects' allegiance to the Pope had the stronger moral hold upon them, so that the contumacious prince was threatened with a loss of his own local authority, as well as with the moral disapproval of all the rest of Western Christendom. These were forces against which no medieval Western princeling could permanently contend. But the ability of the Papacy to mobilize these formidable moral forces in the Papal cause on any given occasion clearly depended upon the maintenance of a moral prestige which was overwhelmingly superior to that of any temporal ruler. This essential superiority of prestige was possessed in the ninth century by Pope Nicholas I as against Charlemagne's unimpressive diadochi and epigoni; and it was possessed again in still greater measure by a sufficient number of Popes in a series that opened with Hildebrand and closed with Innocent III. From the middle of the eleventh to the middle of the thirteenth century the Papacy could feel confident of emerging victorious in the long run from any conflict with any Western temporal ruler. Thereafter the moral prestige on which this Papal potency depended was ruined by the Papacy itself in its hybriatic self-idolization. Yet the accumulated prestige of the master-institution of the medieval West was so immense that it took centuries of folly and misconduct to dissipate it. 'The Babylonish Captivity' had to be followed by the Great Schism, and the Great Schism by the Conciliar Movement, before a Henry VIII could defy the Papal censorship of royal morals with impunity (see IV. C (iii) (c) 3 (β), pp. 512-84, above).

political circumstances, Basil's restoration of Ignatius to his Patriarchal chair in A.D. 867 cannot, perhaps, be regarded as a moral victory for the Patriarch over the Imperial Power; indeed, the true situation was made cruelly apparent ten years later when, upon Ignatius's death in 877, Basil promptly appointed to succeed him his erstwhile supplanter, the pliant worldling Photius. Yet this rather ignominious sequel to Ignatius's bearding of Bardas did not deter a more famous and forceful Patriarch in the next generation from discharging in his turn this formidable Patriarchal duty of calling the ruling personality in the East Roman Empire to account.

When the Emperor Basil I's son and successor, the Emperor Leo the Wise, set his heart in A.D. 905 upon marrying for the fourth time, and requested the reigning Oecumenical Patriarch Nicolaus Mysticus¹ to give his blessing to this Imperial project, the Patriarch refused to countenance an act which would be a flagrant breach of canon law—without allowing himself to be influenced by the fact that the Emperor was his personal friend and that he held his office by the Emperor's appointment. The farthest that he would go was to baptize and recognize the son who had just been born to the Emperor, out of wedlock, by the lady with whom the Emperor now desired to regularize his relations; and the Patriarch went thus far only on the understanding that the lady herself should be dismissed from the Imperial Court. When Leo accepted these terms and then broke them—three days after the Patriarch had performed his stipulated part—by having the marriage ceremony celebrated for him by another hand and then crowning this fourth wife as his Augusta, Nicolaus became intransigent; and on Christmas Day 906, when nearly twelve months had passed, he gave publicity to his attitude by a gesture which was worthy of Saint Ambrose himself. On Christmas Day 906 the Patriarch closed the doors of Saint Sophia in the Emperor's face; and this time the contest was not ended by the Emperor's retort—which was, no doubt, a foregone conclusion—of arresting and deporting and deposing the intransigent holder of the Patriarchal office and appointing a more pliant personality to replace him. Nicolaus lived to be restored to the Patriarchate by Leo's brother and successor Alexander after Leo's death in 912,² when Leo's unlawful fourth wife was also duly compelled, after all, to retire from

¹ The surname meant, not mystic, but confidential secretary or *Geheimrat* (Hussey, J. M.: *Church and Learning in the Byzantine Empire, 867-1185* (Oxford 1937, University Press), p. 136, footnote 3).

² Leo himself appears to have repented on his death-bed and to have given orders for the Patriarch Nicolaus's reinstatement (*The Cambridge Medieval History*, vol. iv (Cambridge 1923, University Press), p. 257).

the palace to a convent. Nicolaus then lived on to become, after Alexander's death, the President of a Regency Council which took over the government of the Empire on behalf of Leo's—and his fourth wife's—son Constantine Porphyrogenitus; and he still retained his Patriarchate when he lost his political position in A.D. 913, after a four months' tenure, through the return of the young Emperor's exiled mother to power. He remained in office long enough to see the guardianship of the boy-Emperor, and the mastership of the Empire which this guardianship carried with it, wrested out of the hands of the Empress-Dowager in A.D. 919 by the Admiral Romanus Lecapenus;¹ and under this new régime the Patriarch had the satisfaction of formally registering his own complete official victory in the struggle upon which he had entered some fifteen years before. In A.D. 920 the Patriarch Nicolaus, then in undisputed occupation of his Patriarchal Chair, was able to bring to an end, on his own terms, the schism between his own supporters and those of his temporary supplanter the Anti-Patriarch Euthymius. In an 'Act of Union',² which received the signatures of both parties, fourth marriages were condemned categorically, though in general terms.

Since the ultimate issue in the conflict between the Patriarch Nicolaus and the Emperor Leo the Wise had been not the particular question of fourth marriages but the general question of whether in Orthodox Christendom the Imperial office was subject to Patriarchal censorship, it might seem as though the signature of 'the Act of Union' signified a victory of the Church over the State of the same stamp as Pope Nicholas I's victory over the Emperor Lewis II. Indeed, a disinterested observer, had he been called upon to estimate the relative prospects of the Oecumenical Patriarchate and the Papacy in that year 920, would almost certainly have prophesied that the Patriarchate would have both the greater and the nobler future.³ In A.D. 920 the Papacy—bereaved of Imperial protection through the deliberate abstention of the East Roman Government and the lamentable débâcle of the Carolingians—was in the disgraceful plight of being used as a political tool by a gang of parochial Roman adventurers. From 904 to 966 the Papacy was in the hands of the 'family' of Theophylact the Vestiaris, as represented by the lovers and the sons and the grandsons of this gangster's wife and daughters. As late as 974 his grandson

¹ The political aspect of these events in the domestic history of the East Roman Empire has been dealt with already, in its relation to the Romano-Bulgarian War of A.D. 913–27, in IV. C (iii) (c) 2 (β), pp. 384–5, above.

² 'Ὁ Τόμος τῆς ἑνώσεως.
³ It is significant that throughout the struggle between the Patriarch Nicolaus and the Emperor Leo VI it was the Emperor and not the Patriarch that enjoyed the countenance and support of the Papacy (*The Cambridge Medieval History*, vol. iv (Cambridge 1923, University Press), pp. 256–8).

Cencius was able to depose and murder a Pope and install a pretender; and when this Antipope had to evacuate Rome he took refuge at Constantinople and was restored in 984 by an East Roman expeditionary force—to such good effect that he died in possession of St. Peter's Chair.¹ Thereafter, in 997, the anti-German faction in the Ducatus Romanus chose a Greek for their Antipope after they had driven out Otto III's Pope Bruno. Nor was it only for material assistance that Rome in this age addressed herself to Orthodox Christendom. At the turn of the tenth and eleventh centuries such spiritual life as was to be found in Rome at the time was inspired by Basilian monks who had been drawn to Rome from Calabria by the crying need for filling a spiritual void.² On the eve of Hildebrand's birth there was nothing whatever in the Roman scene to suggest the imminence of the Hildebrandine revival. Even beyond the Alps the Cluniac movement, though now well under way, had not yet revealed its potentialities.³ In fact, for a full century after the Oecumenical Patriarch Nicolaus's triumph in A.D. 920 a disinterested observer might reasonably have pronounced that the spiritual citadel of Christianity was neither Rome nor Cluny but Constantinople. Yet any such pronouncement would have been promptly confuted by the sequel. Our hypothetical observer would not only have been astonished to see Marozia's grandson Pope John XII succeeded by Hildebrand within ninety years; he would have been perhaps even more surprised to see the Oecumenical Patriarch Nicolaus Mysticus succeeded by—nobody!

The truth seems to be that though Nicolaus was a much stronger character, as well as a much abler man, than his predecessor Ignatius, he was nevertheless outmanœuvred by the upstart Emperor Romanus Lecapenus in 919 in much the same way as Ignatius had been manipulated by the upstart Basil I in 867. In any case the Patriarch Nicolaus's ostensible victory did not accrue to the advantage of the Oecumenical Patriarchate—and this in spite of the fact that it could not have come at a more opportune moment for enabling the Patriarchate to recover the position which it had occupied, three hundred years before, in the time of the Patriarch Sergius. From the death of Leo the Wise in A.D. 912 till the end of Basil II's minority in A.D. 985 the legitimate occupants of the Imperial Throne were all the time either minors or political nonentities. Here was an unparalleled opportunity for some other power or institution in the body of the Orthodox Christian Society

¹ For this incident see IV. C (iii) (c) 2 (β), p. 338, footnote 1, above.

² See IV. C (iii) (c) 2 (β), p. 357, above.

³ Indeed, since about A.D. 940 the Cluniac and other monastic reformers of France and Lotharingia had been coming for inspiration to the Basilian monastic settlements on Monte Gargano (see Gay, J.: *L'Italie Méridionale et l'Empire Byzantin* (Paris 1904, Fontemoing), p. 385).

to assert itself at the expense of the Imperial Crown and thus do Society the service of putting an end to that unhealthy predominance of one single institution which had prevailed for the past two hundred years. The power marked out for playing this role was the Oecumenical Patriarchate, which had just won a great moral victory over the Imperial Crown on the eve of the Crown's eclipse. Yet the Patriarchate failed to seize the opportunity that was offered to it. The Patriarch Nicolaus's regency in the year 913 did not create a precedent. Perhaps the deciding factor was the perilousness of the position in which the East Roman Empire found itself at this moment *vis-à-vis* Bulgaria; and this peril, as we have seen,¹ was part of the nemesis to which the Orthodox Christian Society had exposed itself through having subordinated the Church to the State during the eighth and ninth centuries. Whatever the explanation may be, the historical fact is that the regency of the East Roman Empire was not now secured by the Oecumenical Patriarchate as a permanent constitutional prerogative, but was usurped from 919 onwards until 976 by a series of military adventurers, beginning with Romanus Lecapenus and his sons and ending with Nicephorus Phocas and John Tzimiscēs. This military regency was a vigorous but a violent régime; and it met the foreign peril that had brought it into power by a grandiose policy of conquest which was a new and, as it proved, a disastrous departure in East Roman statesmanship.² It was after the East Roman Empire's fifty-seven years of military dictatorship that the Orthodox Christian Civilization broke down; and the breakdown and the dictatorship are demonstrably related to one another in the relation of effect and cause. If, during those critical years in the middle of the tenth century, the unhealthily predominant role of the East Roman Imperial Government in the life of Orthodox Christendom had been moderated by a touch of clericalism instead of being accentuated, as it actually was, by a bout of militarism, it seems probable that the disaster might have been staved off, and possible that it might have been averted.³

If we now glance back, from this point, over the history of the Orthodox Christian Civilization during its prematurely interrupted

¹ In IV. C (iii) (c) 2 (β), pp. 377-91, above.

² For this latter-day East Roman militarism see IV. C (iii) (c) 2 (β), pp. 399-403, above.

³ More than a century after the time of the Patriarch Nicolaus Mysticus, his successor Michael Cerularius (*fungebatur* A.D. 1043-58) took advantage of the weakness which had overtaken the Imperial Power, after the death of the Emperor Basil II in 1025, in order to grasp at the prize which Nicolaus had missed. Cerularius seems to have come rather near to success in his dealings with the Emperors Michael VI Stratioticus and Isaac Comnenus; but even if his success had been complete it would have come too late, since the breakdown of the Orthodox Christian Civilization had by then already taken place. (The episode of Cerularius's Patriarchate is discussed in Hussey, J.M.: *Church and Learning in the Byzantine Empire, 867-1185* (Oxford 1937, University Press), pp. 152-7.)

growth-phase, we can perceive both the extent and the limits of the State's ascendancy over the Church.

In the course of the two centuries that elapsed between the accession of Leo Syrus and the beginning of the regency of Romanus Lecapenus the East Roman State did effectively reduce the hierarchy of the Orthodox Church in its dominions to the status of a public service which had to be as amenable as any other branch of the Imperial administration to the will of a Government which was an absolute autocracy. When a Germanus came into collision with a Leo Syrus, or a Nicephorus with a Leo Armenius, or an Ignatius with a Caesar Bardas, or a Nicolaus with a Leo Sapiens, it was always the Emperor, and never the Patriarch, whose will prevailed; and this 'law' of East Roman history was illustrated just as pointedly when Ignatius was reinstated by Basil I or Nicolaus by Basil's son Alexander. On the other hand the Imperial Crown discovered that it could only carry off this cherished assertion of its sovereign authority over the Oecumenical Patriarchate by constituting itself the unimpeachable guardian and the zealous exponent of an Orthodoxy of which it could not at the same time constitute itself the judge. If the precious political precedent that had been set by Leo's drastic treatment of Germanus was to be harvested by Leo's successors on the Imperial Throne, then they must pay for this political advantage in religious coin by accepting Germanus's views, instead of Leo's, on the subject of the proper place of icons in Christian worship; and, on the same principle, if the Admiral Romanus Lecapenus was to make quite certain that the regency of the Empire, which he had usurped for himself, should not revert to the Patriarch Nicolaus, then, again, he must pay in the same religious coin for the same political commodity by accepting Nicolaus's views on the subject of the unlawfulness of fourth marriages. From the Crown's standpoint the vital necessity, on every occasion of encounter, was to put the Patriarchate in its place: that is, to advertise the fact that the Emperor and not the Patriarch was the master. If this fundamental proposition of East Roman political theory was effectively demonstrated in consequence of an Emperor's decision to purge Christian worship of icons or to contract a fourth marriage, then, when once the demonstration had been made, the Crown could afford to abandon Iconoclasm and to admit that fourth marriages were unlawful—and, henceforth, woe betide the Patriarch who dared to preach or practise what the Emperor had now renounced! So long as he was acknowledged to be master the Emperor was willing to be Orthodox; and so long as he was allowed to assert his mastery by his own tests he was willing to leave the definition of Orthodoxy to his clerical servants.

If this is a correct account of the relations between Church and State in the Orthodox Christian Society during its growth-phase, it will not be found applicable to the 'Time of Troubles' which set in after the breakdown in the tenth century. In the course of this later and more calamitous age we shall notice a considerable shift in the Balance of Power between the two leading institutions of the Orthodox Christian social system, and we shall observe that the change is in the Church's favour. The discomfiture of the State by the Church in this chapter of Orthodox Christian history is proved on the touchstone of the burning question of the age.

As the Orthodox Christian Society disintegrated it grew steadily weaker by comparison with its neighbours—the coeval sister society of Western Christendom on the one side and the nascent Iranic successor of the moribund Syriac Society on the other—and, as this happened, there was a change of emphasis in the field of religious controversy. The icon question, which had long ago been settled by compromise,¹ was now no longer a living issue; the question of ecclesiastical censorship over Imperial morals was in abeyance; the burning question now was that of the relation between the Orthodox and the Western Church. This question, of course, had its doctrinal aspect—the omission or insertion of the *Filioque* in the Creed—and its hierarchical aspect—the ecclesiastical independence of the Eastern Patriarchates or their subordination to the Roman See—but at bottom it was a question of politics. If the two churches could compose their differences, then Orthodox Christendom might hope to secure Western help against Turkish aggression. Conversely, if these differences were to rankle into a permanent and acknowledged schism, then Orthodox Christendom had to fear that the Franks might anticipate the Turks in making her their prey. This political issue was manifestly crucial; the fate of the East Roman Empire, and of the Orthodox Christian Society itself, was in the balance; and once again, as in the eighth and ninth centuries, the Orthodox Church and the East Roman Government were ranged on opposite sides—but this time under new conditions and with a different result.

This time it was not possible to arrive at a compromise on the previously accepted lines of tacitly separating the political and ecclesiastical aspects of the conflict from one another; for the political issue, now, was not simply the question whether the Church should admit the superior authority of the Imperial will on the unwritten and even unspoken understanding that the Constantinopolitan 'Caesar-Pope' should exercise the Papal functions of his 'totalitarian' authority in accordance with ecclesiastical rulings.

¹ See V. C (i) (d) 9 (β), vol. vi, p. 117, below.

The answer to the political question in the present controversy depended neither upon the Orthodox Church nor upon the East Roman Imperial Government, but upon an alien power: the other, and now far stronger, Christendom in the West. This alien power now had the fate of Orthodox Christendom in its hands; it had the choice of either saving Orthodox Christendom or destroying her; and it would not choose the political course that meant her salvation unless the hierarchical and doctrinal issues were first of all settled to its satisfaction. In these circumstances East Roman statesmanship was bound to exert itself to the utmost in order to satisfy the Western Christians' ecclesiastical demands; and therefore, this time, it was not open to the East Roman Government to achieve its political aim by the time-honoured expedient of leaving the definition of Orthodoxy to the clerics. This time the ecclesiastical question and the political question hung together indissolubly; and the Emperor therefore had to insist *à outrance* upon a definition of Orthodoxy that would make his policy possible. He found, however, that the limits of his authority in the ecclesiastical sphere were unaltered and inelastic. In the definition of Orthodoxy the Church still had the last word; and now that the East Roman Imperial authority was perceptibly on the wane the Imperial statesmanship could not induce the Church to relinquish a prerogative to which it had clung, in the teeth of the Imperial Government, when the Empire had been at its zenith. On the questions of the *Filioque* and the Papal supremacy, as on those of icons and fourth marriages, the Church had its way; and the East Roman Government had to resign itself to the inevitable political consequences, though these were nothing less than the annihilation of the last vestige of the East Roman Empire and the forcible political unification of a long-distracted Orthodox Christian World under the pall of a *Pax Ottomanica*.¹

In this connexion it is noteworthy that the attitude of the East Roman Government on the questions of the Papal supremacy and the *Filioque* was from first to last conciliatory towards the Papacy by comparison with the attitude of the hierarchy of the Orthodox Church.²

¹ For the role of the Ottoman Empire in Orthodox Christian history as the Orthodox Christian universal state see Part III. A, vol. iii, pp. 26-7, above, and V. C (ii) (a), vol. vi, pp. 190-1, and V. C (ii) (b), vol. vi, pp. 298-300, below.

² The Orthodox hierarchy was never ready to acknowledge the Papal supremacy in matters of discipline or of doctrine—even when it was in desperate need of support against the East Roman Imperial Power. In the last resort the Orthodox hierarchy preferred the political yoke of an Emperor to the ecclesiastical yoke of a Pope if it was driven to make a choice between the two servitudes. On the other hand the Basilian monks, who had no hierarchical considerations to deter them, did not hesitate to place themselves under the banner of the Pope in their struggle against the Iconoclast East Roman Emperors.

This difference became apparent during the first crisis in the relations between Orthodox and Western Christendom—a crisis which began with Pope Nicholas I's championship of the *ci-devant* Oecumenical Patriarch Ignatius after his deposition in A.D. 858,¹ and which died away after the second deposition of Ignatius's supplanter Photius in A.D. 886.² The crisis was a dangerous one because the original conflict over a question of ecclesiastical discipline was enlarged and envenomed, not only by the introduction of a question of doctrine, but also by a competition for the ecclesiastical allegiance of the whole interior of South Eastern Europe from the Adriatic to the Carpathians and from the head-waters of the Maritsa to those of the Elbe.³ In this formidable transaction

¹ For the collision between the Patriarch Ignatius and the Caesar Bardas see pp. 597–8, above.

² The formal healing of the schism appears to have been accomplished in the years A.D. 898–900 (*The Cambridge Medieval History*, vol. iv (Cambridge 1923, University Press), pp. 255–6, and Hussey, J.M.: *Church and Learning in the Byzantine Empire, 867–1185* (Oxford 1937, University Press), p. 135).

³ This competition was a consequence of the removal of certain obstacles which had latterly insulated the two Christendoms from one another on the landward side. Under the Roman Empire within the Continental European frontiers that had been secured for it by Augustus (see V. C (i) (c) 3, Annex I, vol. v, pp. 591–5, below) there had, of course, been direct communication overland, round the head of the Adriatic, between the Balkan and Asiatic provinces of the Empire on the one side and the West European provinces on the other; but Narses' march from a Balkan base of operations to an Italian theatre of war in A.D. 552 was the last recorded use of this overland route in the Empire's history. The overland communications between Constantinople and Milan, or Constantinople and Cologne, were severed by the Nomad pseudo-Avars' occupation of the Hungarian Alföld in A.D. 567 and the Nomad Bulgars' occupation of the southern as well as the northern half of the Lower Danube Basin in A.D. 680 in the wake of the Slav infiltrations of the sixth century. (See Part III. A, Annex II, vol. iii, pp. 425 and 427, above.) By the middle of the ninth century, however, the insulation which had resulted from the combined effect of these barbarian intrusions had been overcome, partly through Charlemagne's extirpation of the incurably barbarous Avars in A.D. 791, and partly through the peaceful radiation of both the two adjoining Christian cultures into Bulgaria and the Slavias. In the seventh decade of the ninth century the pull of the two Christendoms upon the barbarians of South Eastern Europe became strong enough to make the barbarians themselves feel that they could no longer hold their own in the new homes which their immigrant forefathers had bequeathed to them unless they came to terms with one or other of the formidable, and at the same time fascinating, cultures that were exerting an ever-increasing influence upon these barbarians' lives; and, having all come more or less simultaneously to this conclusion, they severally decided that the adventure in civilization on which they had now determined to embark would be less hazardous if they chose the more distant, rather than the nearer, of the two Christendoms to be their god-parent. Accordingly we find Rostislav (or Rastislav), the barbarian prince of the Slavonic principality of Moravia, whose dominions lay close up against the expanding eastern frontier of the Carolingian Empire, applying to the East Roman Government at Constantinople for missionaries to instruct his subjects in the Christian Faith (Dvornik, F.: *Les Slaves, Byzance et Rome au IX^e Siècle* (Paris 1926, Champion), pp. 147 and 157–9), while Boris, the contemporary Khan of Bulgaria, whose dominions lay in an equally uncomfortable proximity to the Thracian frontier of the East Roman Empire, resorted to the East Roman Government's prompt dispatch to Moravia of the missionaries Cyril and Methodius—a move which threatened him with encirclement—by allying himself, in the same year, with the Western Emperor Lewis II (Dvornik, op. cit., p. 186). This Bulgarian move led the East Roman Government, in its turn, to hustle Bulgaria in 865 into an acceptance of Christianity from Orthodox Christian hands by the adroit combination of a military demonstration (see IV. C (iii) (c) 2 (β), p. 380, above) and a territorial *douceur* (see the same chapter, p. 343, footnote 2, above). Boris, thus outmanoeuvred by East Roman statesmanship in 865, sought to safeguard a Christian Bulgaria against the overwhelming pressure of the Orthodox Christian Power which was her immediate neighbour by the clever stroke of placing Bulgaria under Papal jurisdiction in 866—a counter-move which promised to neutralize

the East Roman Government limited itself to two moderate aims and contented itself with achieving these and these only. The first aim was to make it unmistakably clear that the Emperor and not the Pope was the Oecumenical Patriarch's master; the second aim was to prevent the Pope from recovering his ancient ecclesiastical jurisdiction over Illyricum, of which he had been deprived in A.D. 732 by the Emperor Leo Syrus.¹ The aims of the Patriarch Photius were more ambitious and more aggressive. He wanted to discredit once for all the Papacy's claim to ecclesiastical supremacy over the other Patriarchates, and in order to compass this aim he was ready to open a doctrinal as well as a disciplinary breach between the Churches by convicting the Pope of heresy. The East Roman Government, however, was careful not to extend its support of its servant the Oecumenical Patriarch any farther than the Imperial policy required.

When Pope Nicholas I insisted upon the restoration of Illyricum, Calabria, and Sicily to his own jurisdiction, as a condition of his recognizing the legitimacy of Photius's investiture, the Imperial Government gave Photius its support. But after Photius, in 867, had gone so far as to denounce the Pope publicly for his concurrence in the Western heresy of adding the *Filioque* to the Nicene Creed, the newly enthroned Emperor Basil I deposed the over-militant Photius and restored Ignatius (whose act of *lèse-majesté* had not been committed against Basil personally, and whose spirit had been chastened in the meanwhile by some nine years of languishing in the wilderness). Thereupon the Emperor wrote to the Pope 'to ask him to send legates to a council at which the past should be forgotten, the Roman precedence stated and supremacy hinted, and no one should mention the word *Filioque*'.² At this Constantinopolitan Oecumenical Council of A.D. 869-70 Basil was, indeed, concerned with other things—to wit, the two fundamental aims of the Imperial policy—and he took the Papal legates by surprise in displaying an efficiency in the pursuit of his own interests which contrasted strongly with his indifference to the interests of his Patriarch. The Emperor saw to it that the procedure for the ex-Patriarch's trial should be arranged to the Emperor's own liking and not to the legates' liking; and when a Bulgarian embassy applied to the Council for a judgement as to whether the ecclesiastical allegiance of Bulgaria was owing to Rome or to Constan-

the East Roman success of the preceding year. It will be seen that the action taken by a barbarian Rostislav and a barbarian Boris in the years 862-6 raised the whole question of the ultimate ecclesiastical and cultural allegiance of South Eastern Europe. There is an illuminating discussion of this question in Dvornik, *op. cit.*, chs. 5-9.

¹ See IV. C (iii) (c) 2 (β), p. 337 and p. 346, footnote 2, and the present Annex, p. 595, above.

² Runciman, S.: *A History of the First Bulgarian Empire* (London 1930, Bell), p. f. 12.

tinople, the Emperor saw to it, again, that the representatives of the four Eastern Patriarchates should all pronounce in favour of Constantinople over the Papal legates' heads.¹

When, after this, the Papacy continued to make obstinate efforts to entice Bulgaria back to that ecclesiastical allegiance to the Roman See which she had acknowledged during the five years ending in 870,² Basil took the opportunity of Ignatius's death in 877 to reappoint Photius to the Patriarchal Chair, with instructions, this time, to solicit the Pope's approval for his appointment and to accept the condition, which the Pope proceeded to lay down, that the ecclesiastical jurisdiction over Bulgaria must be retroceded to the Papacy by the Patriarchate. This Photian *volte face* by Imperial command induced the Pope to send legates to a new council which met at Constantinople in 879; and here the Papal legates were persuaded to concur in referring the question of Bulgaria's ecclesiastical allegiance to the decision of the East Roman Emperor. Presumably they were given to understand in advance that if the Emperor's title to make the award were recognized he would render the award in their Pontifical master's favour. In any case the Emperor did actually decide in this sense; and the transaction is characteristic of the Imperial policy. What the Imperial Government really had at heart was to obtain a public acknowledgement that on the question of the ecclesiastical allegiance of Bulgaria the last word lay neither with the Patriarchate nor yet with the Papacy but with the Imperial Government itself; and for the sake of securing this victory in principle the Imperial Government was not unwilling to make a provisional concession on a point of practice.

As a matter of fact this award in the Papacy's favour cost the East Roman Empire nothing; for the Bulgarians (disillusioned by their short experience of Papal jurisdiction)³ annulled the Imperial

¹ On the historical merits of the case the Eastern Patriarchs were substantially in the right; for both the contemporary Bulgarian capital of Pliska, and the subsequent capital of Preslav, which was substituted for Pliska in the reign of Symeon (*imperabat* A.D. 893-927), lay within the former bounds of the *ci-devant* Roman Province of Moesia Secunda, which belonged to the Imperial Diocese of Thrace, which, in turn, was under the ecclesiastical jurisdiction of the Patriarchate of Constantinople. At the same time it is true that the ninth-century acquisitions of Bulgaria in the interior of the Balkan Peninsula, from Sardia south-westwards, lay within the former bounds of the *ci-devant* Roman Prefecture of Illyricum, which had originally fallen within the jurisdiction of the Roman See. As for Transdanubian Bulgaria, which lay within the bounds of the original Roman Province of Dacia, this was an ecclesiastical no-man's-land to which neither the Roman nor the Constantinopolitan Patriarchate could lay claim, since Dacia had been re-abandoned to the barbarians by Aurelian in the third century before the ecclesiastical geography of the Christian Roman Empire had been worked out.

² For this passing incident in Bulgarian ecclesiastical history see IV. C (iii) (c) 2 (β), pp. 380-1, and the present Annex, p. 605, footnote 3, above.

³ In his reply to Boris' original overtures to the Roman See in A.D. 866 Pope Nicholas I had returned a non-committal answer to the Bulgarian Khan's request that he should be allowed to have a Patriarch of his own (Dvornik, *op. cit.*, p. 192). Thereafter the

award *de facto* by a policy of 'masterly inactivity'; and no doubt the Emperor had informed himself that this would be the sequel before he entered into his understanding with the Papal legates.¹ Thus the Emperor managed to deprive the Papacy of any plausible ground for convicting him of injustice, or even of unfriendliness, in his dealings with the Roman See, while at the same time he effectively secured that the whole of the interior of the Balkan Peninsula—both the *ci-devant* Diocese of Thrace and the *ci-devant* Prefecture of Illyricum—should be incorporated into the body social of Orthodox Christendom instead of gravitating towards the now alien and rival Christendom of the West.

In pursuing this policy of gaining the gist of what he wanted without goading the Papacy into making a breach with him Basil was also careful not to push his cultural imperialism in South Eastern Europe farther afield than seemed strictly necessary for the East Roman Empire's political security. So long as he could make sure of Bulgaria, which lay at his gates, he was content to let the distant Moravia go; and in this Moravian field the tactics of our modern Western imperialism—'first the missionary, then the consul, then the soldier'²—were not pursued by the cautious ninth-century East Roman statesman. Basil appears to have borne no grudge against the Photian missionaries, Cyril and Methodius, for their early decision³—which they took on common-sense geographical grounds—to place their new Moravian Church under the Papal jurisdiction.⁴ And when, after the death of Cyril's sur-

same Pope had recalled from Bulgaria his legate Bishop Formosus of Porto because he suspected him of pandering to Boris' ambition to obtain ecclesiastical autonomy (Dvornik, *op. cit.*, pp. 193-4). The last stroke that alienated Boris from Rome was the intransigence of the Curia in refusing to appoint as Bishop of Bulgaria the candidate on whom Boris had set his heart (Dvornik, *op. cit.*, p. 195).

¹ In fact, on the question of the ecclesiastical allegiance of Bulgaria the Papal legates were the victims of a trick, and they also succumbed to two other pieces of East Roman diplomatic sharp practice. Without realizing, apparently, what they were doing, they subscribed to an anathema against anybody who added anything to the Nicene Creed (that is, an anathema against the Pope for accepting the *Filioque*); and they also subscribed to a conciliar resolution rejecting the Pope's proposal to prohibit the nomination of laymen to the Episcopate (i.e. rejecting the Pope's manœuvre for disqualifying Photius).

² This description of our modern Western method of encroachment upon the lives of non-Western societies is attributed to the Emperor Theodore of Abyssinia, who duly met his end at the hands of a Western expeditionary force.

³ 'Je connais, avait-il dit, la tactique des gouvernements européens quand ils veulent prendre un état d'Orient. On lance des missionnaires d'abord, puis des consuls pour appuyer les missionnaires, puis des bataillons pour soutenir les consuls. Je ne suis pas un rajah de l'Indoustan pour être berné de la sorte: j'aime mieux avoir affaire aux bataillons tout de suite.'—Lejean, G. (ancien vice-consul de France à Massaua): *Théodore II, le Nouvel Empire d'Abyssinie, et les Intérêts Français dans le Sud de la Mer Rouge* (Paris 1865, Amyot), p. 160.

⁴ This decision seems to have been taken not later than A.D. 867, for the Pope to whom the two Photian missionaries made their application was Nicholas I, who died on the 13th November of that year.

⁵ The persistence of the friendship between the Imperial Court and the Photian missionaries in Moravia is proved by the fact that, circa A.D. 881, Methodius received and accepted an invitation from the Emperor Basil I to pay him a visit at Constantinople,

vivor Methodius in 885, the fledgeling Methodian Church was forcibly broken up, with the Papacy's connivance, by German missionaries of the Latin rite,¹ Basil appears again to have refrained from protesting against a high-handed act which implied the unqualified and definitive incorporation of the Moravian half of the South-East European no-man's-land into the body social of Western Christendom. The East Roman Government contented itself with rescuing the survivors of the Moravian clergy of the Slavonic rite and placing their services at the disposal of the Bulgarians,² who had revealed their intention to throw in their lot with Orthodox Christendom by tactfully ignoring the Emperor's own award of the year 879.³

This display of moderation and humanity was a master-stroke of East Roman diplomacy; for it served three purposes simultaneously. It gave the Bulgarians a concrete proof of East Roman goodwill and good faith; it emphasized the advantages of allegiance to a Church which tolerated and encouraged the ecclesiastical use of the local vernacular, by contrast with the irksomeness of the Western Church's oppressive imposition of an alien Latin; and in the third place it widened the gulf between a Bulgaria which took kindly to the Slavonic Liturgy and a Roman Church which would presumably be unwilling ever to concede to Bulgaria an indulgence which it had revoked so quickly, and so ruthlessly, in Moravia.⁴ Thus Basil anchored Bulgaria to the Orthodox allegiance; and his son and successor Leo the Wise clinched Basil's work by calling in the Nomad Magyars,⁵ with the result that these pagan barbarians

and also acceded to the Emperor's request to him to leave behind him a priest and a deacon of his party, with Slavonic books (Dvorník, op. cit., p. 278).

¹ After the death of Cyril during the two brothers' visit to Rome, Methodius had succeeded, with some difficulty, in persuading Pope Nicholas I's successor, Pope Hadrian II, to give the Moravian Church a *quid pro quo*, in exchange for its acceptance of the Papal jurisdiction, in the shape of a Papal authorization to employ a Slavonic Liturgy (see IV. C (iii) (b) 11, p. 216, footnote 1, above). This insistence of Methodius upon the use of the local vernacular, combined with his refusal to follow the Papacy in introducing the *Filioque*, were the offences which drew down destruction upon the Moravian Church after the death of the second of its two great founders (see IV. C (iii) (c) 2 (β), p. 381, above).

² Runciman, op. cit., pp. 124-6; Dvorník, op. cit., pp. 298-9; see also the present Study, IV. C (iii) (c) 2 (β), p. 381, above.

³ See pp. 607-8, above.

⁴ It is an intriguing, though perhaps an unanswerable, question whether there was any continuity of tradition between the short-lived Cyrillo-Methodian Slavonic Church of Moravia, which was founded in A.D. 862 and was suppressed by violence in A.D. 885, and the likewise ephemeral Hussite Slavonic Church which arose in the Bohemian part of Rostislav's Moravian principality some five centuries later. Both these 'Czecho-Slovak' religious movements were distinguished by a passionate attachment to the mother tongue, a deep hostility to Germanism, and an unwillingness to accept the supremacy of the Roman See except on their own terms. Are these remarkable resemblances simply the outcome of a fortuitous similarity of circumstances? Or was there in fourteenth-century Bohemia a subterranean 'folk-memory' of the Cyrillo-Methodian Church which was brought to the surface by the attraction of the kindred ideas of a latter-day English Wyclif?

⁵ For the circumstances see Part III. A, Annex II, vol. iii, p. 442, above.

occupied the Hungarian Alföld and thereby insulated the Cis-danubian remnant of an Orthodox Christian Bulgaria from the Transdanubian remnant of a Western Christian Moravia.¹ No doubt the East Roman Government was relieved to see the problems that had been raised in A.D. 862, by the establishment of contact between the two Christendoms overland, disposed of in A.D. 895 by the reintroduction of that wedge of insulating paganism which had been provided by the Avars before their annihilation in A.D. 791.²

The East Roman Emperor Basil I showed equal tact in handling the delicate relations between the East Roman Government and the Papacy that were involved in the expansion of the East Roman Empire's political dominions in Southern Italy.³ In A.D. 732 Basil's predecessor Leo Syrus had transferred from the ecclesiastical jurisdiction of the Papacy to that of the Oecumenical Patriarchate⁴ the East Roman territory of Calabria, which in Leo's day was confined to the 'toe' of Italy (from the basin of the River Crati, inclusive, southwards) together with the enclave of Gallipoli in the 'heel'.⁵ Between 876 and 915 this modest overseas holding of the East Roman Empire on Continental Italian ground was expanded into an imposing dominion which included the whole of Southern Italy up to Gaeta on the one coast and the Gargano Peninsula on the other; and all the territory between the new frontier of 915 and the old frontier of 876⁶ was, at the time of the East Roman conquest,

¹ The Magyars evicted the Moravians and the Bulgars from their respective possessions in the Alföld; the Pechenegs, treading on the Magyars' heels, evicted the Bulgars from their remaining Transdanubian possessions in the territories now known as Moldavia, Wallachia, and Transylvania (see IV. C (iii) (c) 2 (β), p. 383, footnote 1, above).

² There is an unmistakable conformity between the respective variations of the ecclesiastical relations between the Orthodox and Western churches and the geographical relations between the Orthodox and Western Christian worlds. The ecclesiastical relations became bad at the time of the first re-establishment of geographical contact overland in A.D. 862; this first ecclesiastical crisis passed off about the time when this geographical contact was broken by the Magyar occupation of the Alföld circa A.D. 895; a fresh crisis in ecclesiastical relations broke out after the second re-establishment of contact overland through the conversion of the Magyars to Western Christianity at the turn of the tenth and eleventh centuries. This time the re-establishment of geographical contact was permanent, and—conformably—the ecclesiastical schism was definitive.

³ For the history and motives of this East Roman expansion in Southern Italy—which began with the occupation of Bari in 876, was consummated in the campaign of Basil's general Nicephorus Phocas the elder in 885, and was confirmed by the extirpation of the nest of African Muslim pirates on the Garigliano in 915—see IV. C (iii) (c) 2 (β), pp. 343-4, above.

⁴ See IV. C (iii) (c) 2 (β), pp. 337 and 346, footnote 2, and the present Annex, p. 595, above.

⁵ The rest of the 'heel' had been conquered by the Lombard principality of Benevento between A.D. 671 and A.D. 687, after the death of the Roman Emperor Constans II. For Constans' previous attack on Benevento see IV. C (iii) (c) 2 (β), Annex I, above.

⁶ This territory falls into three categories: first the *ci-devant* possessions of the Lombard Duchy of Benevento in Apulia which had been conquered from the Lombards by Muslim raiders from Ifriqiyah in A.D. 840-5, wrested from these African conquerors by the East Roman Government in 876, and annexed to the East Roman Empire out-

under the ecclesiastical jurisdiction of the Papacy. It would have been logical for the Emperor Basil to extend the ecclesiastical jurisdiction of his Patriarch, at the expense of the Pope, *pari passu* with the extension of his own political sovereignty at the expense of the previous political masters of Southern Italy; but a step that would have been logical would also have been highly impolitic, and Basil was careful to refrain from taking it. It has been conjectured that his son and successor Leo the Wise had a tacit understanding with the Roman See over the ecclesiastical allegiance of the South Italian bishoprics on the borderline.¹ In any case the three dioceses of Taranto, Oria, and Brindisi remained under the Papal jurisdiction and continued to use Latin as their liturgical language;² and the only new diocese of Greek language and Constantinopolitan allegiance that was created in Southern Italy at this time was that of Santa Severina in old Calabrian territory which had been under East Roman rule all along.³

This statesmanlike moderation of Basil and Leo remained the norm of East Roman ecclesiastical policy in Southern Italy so long as the East Roman dominion lasted—with a single exception, which proves the rule, during the reign of the military dictator Nicephorus Phocas the younger (*imperabat* A.D. 963–9).⁴ Having quarrelled with the Western Emperor Otto I over the political possession of Southern Italy, the East Roman Emperor Nicephorus revenged himself on the Papacy—which had called Otto in and had taken shelter under his aegis⁵—by setting himself to detach from the Roman allegiance a number of bishoprics in the East Roman provinces of Laghvardhia and Vasilicata—a move to which the Papacy replied by strengthening its own ecclesiastical organization in the East Roman protectorates of Benevento and Salerno.⁶ This change in East Roman ecclesiastical policy may have been one of the causes of the revolt of the Empire's Apulian Lombard subjects against the Imperial Government in A.D. 1009;⁷ but the strain imposed upon the relations between that Government and the Papacy was not so serious as to prevent these two Powers from taking concerted military action in A.D. 1053 against the Norman adventurers

right; second the surviving 'successor-states' of the Lombard Duchy of Benevento—the Duchies of Benevento, Capua, and Salerno—which were compelled to accept an East Roman protectorate in 885; third the three city-states of Amalfi, Naples, and Gaeta which had never been conquered by the Lombards and which paid to the East Roman Empire of Leo Syrus and Basil I the allegiance which they had never ceased to pay to the Roman Empire of Justinian and Heraclius.

who were at that time threatening to sweep away the whole political *status quo* in Southern and Central Italy.¹

From the foregoing survey it will be apparent that one of the uses to which the East Roman Government put its 'Caesaro-papal' authority over the Orthodox Christian Church—at any rate, from the reign of Basil I onwards—was to prevent the ecclesiastical rivalry between the Oecumenical Patriarchate and the Papacy from leading to an irremediable rupture. And this use of the monopoly of power which Leo Syrus had concentrated in the East Roman Government's hands was good as far as it went. The monopoly itself, however, was a social evil of such intrinsic maleficence that, as we have seen,² it involved not only the East Roman Empire, but the entire Orthodox Christian body social, in a premature breakdown. And as soon as this breakdown produced one of its inevitable fruits, in a weakening of the East Roman Government's power, the Orthodox Church took its revenge upon an oppressively 'totalitarian' political institution by casting off these galling political chains and trampling vindictively upon the tyrant who now lay prostrate. This belated revolt of the Orthodox Church against the East Roman Imperial Government³ in the days of the Orthodox Christian Society's decline was natural, but it was also suicidal; for the point on which the tardily emancipated Orthodox Church chiefly delighted to oppose and frustrate the East Roman Government's policy was in the matter of the Empire's good understanding with the Papacy; and when this indispensable column in the architectural design of East Roman statesmanship was pulled down, *furore Sampsonico*, by a subversive-minded Church Militant, the whole edifice of Orthodox Christian Society collapsed.

This disastrous consequence of a rather abrupt change in the Balance of Power between the Orthodox Church and the East Roman State was demonstrated by the success of the Oecumenical Patriarch Michael Cerularius (*fungebatur* A.D. 1043-58) in deliberately producing a schism between the Orthodox Church and the Western Church in defiance of the unanimous wishes of the East Roman Government and the Papacy and at the very time of the military alliance of these two Powers against the Normans which has been mentioned above. At this delicate moment, when the existence of the East Roman dominion in Southern Italy was at stake and when

¹ The joint Papal and East Roman operations of A.D. 1053 were, of course, a fiasco. The East Roman expeditionary force (commanded by Argyrus, the Byzantinized son of the Apulian Lombard rebel Melo) was driven off the field, while Pope Leo IX's German troops failed to save their master from being taken prisoner. (Pope Leo IX's military expedition against the Normans is touched upon in IV. C (iii) (c) 3 (β), p. 548, above.)

² In IV. C (iii) (c) 2 (β), pp. 352-404, above.

³ This ecclesiastical insurrection against the incubus of the East Roman Empire was part of a wider movement—extending over most of the non-political field of social life—which has been touched upon in IV. C (iii) (c) 2 (β), pp. 353-64, above.

friendly relations with the Papacy were therefore more than ever desirable from the East Roman Government's standpoint, Cerularius opened a bombardment of the Roman Church from those latterly silent theological batteries which had first been mounted by his predecessor Photius. On the occasion of Photius's attempt to play this dangerous game his mischievous activities had been promptly and severely quashed by the Emperors Basil I and Leo the Wise; and, when Cerularius assumed the Photian role, an attempt to repress the Patriarch in the traditional Imperial manner was duly made by Constantine IX Monomachus, the Emperor of the day; but, instead of accommodating himself to the Imperial policy like his pliant predecessor, Cerularius proved recalcitrant and unmanageable.

Imperial pressure did, indeed, so far avail as to conscript Cerularius's ungracious co-operation in an attempt to preserve those correct official relations between the Imperial Government and the Papacy that had subsisted, for the most part, since the healing of the Photian schism in A.D. 898-900; and the Imperial diplomacy was able to insist that the first move in these ecclesiastical negotiations should be made by a cleric who was perhaps rather less out of sympathy with the Imperial policy than the Patriarch himself.¹ The negotiations were started by a letter from the autocephalous Archbishop of Ochrida (an Orthodox prelate whose see lay in the West Bulgarian territories of the East Roman Crown, which were outside the Oecumenical Patriarch's jurisdiction)² to the Archbishop of Trani (the most Byzantinophil of the Latin prelates in Southern Italy, by contrast with his neighbour and rival of Bari, who was the protagonist in the anti-Byzantine party).³ This attempt at an ecclesiastical *rapprochement* had the warm approval and support of Argyrus, the Byzantinized son of the Apulian Lombard rebel Melo,⁴ who had been sent out to Italy by the East Roman Government in 1051 on the mission of restoring the Imperial authority after it had been shaken by the double blow of the Norman invasion and the treason of the previous East Roman Governor Maniakis. In fact, it is possible that Argyrus—by origin a Lombard of the Latin rite—was the actual author of the policy, for at the time of his appointment we find him protesting against Cerularius's idea of weaning from the Latin rite the Empire's Latin

¹ Archbishop Leo of Ochrida cannot have struck the Latins as being conspicuously sympathetic to their cause, or he would not have been included, as he was, in the anathema which was pronounced against the Patriarch by the Papal legates in 1054 after the deposit of their bull of excommunication (see p. 614, below).

² For the preservation of the ecclesiastical autonomy of this *ci-devant* West Bulgarian Patriarchate after the annexation of the West Bulgarian Empire to the East Roman Empire in A.D. 1019 see IV. C (iii) (c) 2 (β), p. 394, footnote 1, above.

³ For this first stage of the negotiations see Gay, *op. cit.*, pp. 491-5.

⁴ See p. 612, footnote 1, above.

subjects in Italy.¹ Cerularius, on his part, may have feared that the policy promoted by Argyrus might work together with the contemporary increase in the prestige and power of the Papacy² to checkmate the Oecumenical Patriarchate's South Italian ambitions and perhaps even to eliminate its authority altogether in the regions west of the Adriatic.³ Cerularius was determined to prevent the Imperial Government and the Papacy from securing their respective interests in Southern Italy by a bargain at the Oecumenical Patriarchate's expense; and so he displayed an intransigence and an aggressiveness that were calculated to provoke, and did provoke, a rupture.

In 1053 Cerularius forcibly closed the churches of the Latin rite in Constantinople; and when three Papal legates arrived in Constantinople in the spring of 1054 the Patriarch refused to meet them. The representatives of the Pope were hospitably entertained by the Emperor and were cordially received at the monastery of Studium with its philo-Roman tradition; but the courtesy of the Imperial Government and the monks could neither overcome nor outweigh the Patriarch's studied hostility; and finally, on the 16th July, 1054, the Papal legates deposited on the altar of St. Sophia a document declaring Cerularius excommunicated in the name of their master. The Emperor not only failed in an effort at the thirteenth hour to repair the breach; he was actually compelled by the pressure of public opinion to write the Patriarch an open letter apologizing for his own complacency towards the Roman See and throwing the blame upon Argyrus. Thereafter, with the Emperor's reluctant assent, the Patriarch convened a council of the prelates within his jurisdiction, and on the 20th July, 1054, this Council formally condemned the Papal bull. Thus the East Roman Government's attempt to secure an ecclesiastical *rapprochement* ended unhappily in producing the opposite result of a formal and open schism which was the Patriarchate's tardy but telling revenge upon the Imperial Government for three centuries of humiliation.

This ecclesiastical breach did not break the *entente* between the Papacy and the East Roman Government, but in alienating the sympathies of the East Roman Empire's Latin subjects it played into the hands of the Normans,⁴ and it must therefore be regarded as one of the factors responsible for the extinction of East Roman rule in Italy in the course of the next twenty-five years. In-

¹ Gay, *op. cit.*, p. 471.

² Pope Leo IX (*fungebatur* A.D. 1049-54) was a capable and strong-minded Transalpine cleric who had realized the need for reform and had taken the most effective step possible towards setting a reform movement in motion when he had chosen Ildebrando Aldobrandeschi the Tuscan to be his right-hand man (see IV. C (iii) (c) 3 (β), p. 529, above).

³ Gay, *op. cit.*, p. 497.

⁴ See IV. C (iii) (c) 2 (β), pp. 401-2, above.

cidentally the conquest of the East Roman dominion in Southern Italy by the Normans carried with it the retransference of all the conquered territories—including Calabria and Sicily—from the ecclesiastical jurisdiction of Constantinople to that of Rome. But the Orthodox Christian hierarchy did not draw the obvious inference. Its Italian losses simply exasperated it into an obstinate determination to make sure that the schism of A.D. 1054 should never be closed except—*quod erat absurdum*—through a complete and uncompromising acceptance of the Orthodox Church's terms; and the permanent alienation from one another of the two Christendoms, which was the result of this ecclesiastical intransigence, was a far graver consequence—not only for the East Roman Empire, but for Orthodox Christendom as a whole—than the loss of a Transadriatic outpost.

The policy of keeping on good terms with the Papacy, which had been bequeathed by the Emperor Basil I to his successors on the East Roman Imperial throne, was maintained, with momentary lapses, by the East Roman Government so long as the East Roman Empire continued to exist; but the later Emperors were as unsuccessful as Constantine Monomachus in their attempts to put the policy into effect in the teeth of the Orthodox hierarchy's resistance; and this resistance became all the more fanatical as the disintegration of the Orthodox Christian Society demonstrated, at each further stage of its disastrous course, that the Government and not the hierarchy was in the right.

From the morrow of the restoration of a shadow of the East Roman Empire at Constantinople in A.D. 1261,¹ after the disastrous interlude of a Western usurpation, down to the moment of its final obliteration through the Ottoman Conquest in A.D. 1453, the line of Emperors which began with the re-conqueror of Constantinople, Michael VIII Palaeologus (*imperabat* A.D. 1259–82), and which ended with his descendant Constantine XI Dhraghasis (*imperabat* A.D. 1448–53), made repeated efforts to close the breach that had been opened in A.D. 1054; and these latter-day East Roman statesmen displayed the traditional East Roman sense of political realities. They faced the fact that the Balance of Power between the two Christendoms had now turned overwhelmingly in favour of the West, and they conformed their policy to this change of circumstance by consenting now to come, both literally and metaphorically, on to Western ground. Michael Palaeologus himself was so far from being dazzled by his personal success in recovering the

¹ For the work of the Greek principality of Nicaea in expelling the Western usurpers who had seized Constantinople and Greece in A.D. 1204, under pretext of conducting a 'Fourth Crusade', see Part III. A, vol. iii, p. 27, above.

Imperial City that he lived in dread of seeing this audacious vindication of an historic right bring down upon him the Western *revanche* of another 'crusade' with the Greek 'schismatics' for its victims instead of the Muslim 'unbelievers'; and this prudent anxiety led him, in A.D. 1274, to attend an oecumenical council, convened by Pope Gregory X in the Transalpine city of Lyon,¹ where the schism was officially closed by the Emperor's acceptance of the Papal supremacy and the *Filioque*. As early as 1282, however, Michael's weaker successor Andronicus II was compelled to denounce the Union of Lyon under Orthodox ecclesiastical pressure; and the same fate overtook the Emperor John Palaeologus's repetition of Michael's act in 1439 during the Council of Ferrara and Florence. Once again the articles of capitulation to which an East Roman Emperor had given a facile assent in a Western council-chamber were repudiated by his clergy and people at home; and though, this time, the Imperial Government avoided the additional humiliation of being compelled by its own subjects to denounce a compact with an alien Power which was humiliating enough in itself, this last assertion of the Imperial will profited the Empire nothing.

The last of the Palaeologi, the heroic Constantine Dhraghasis, whose fate it was to play Hector's role in the *excidium* of the Third Troy, was still in communion with Rome when he stood in the breach, awaiting the Janissaries' irresistible assault, on the 29th May, 1453; but he had been basely betrayed by the Western allies whose bounden duty it was to succour their beleaguered co-religionist. Giustiniani and his like no more availed to save the devoted city from its doom than Rhesus had availed to bring effective relief to the Byzantine Hector's Homeric prototype. The same day saw the fall of the Imperial City and of the Imperial namesake of Constantine the Great; and, if we may venture to sum up the common cause of their ruin in a single sentence, we may say that this tragedy occurred in the fifteenth century of the Christian Era because the 'Caesaro-papism' of the Roman Emperor Constantine had been first successfully revived in the eighth century by the East Roman Emperor Leo Syrus and then successfully defied in the eleventh century by the Oecumenical Patriarch Michael Cerularius.

If we probe somewhat deeper into the causes of the shift in the Balance of Power between the East Roman Government and the Orthodox hierarchy during the four centuries, ending in the year 1453, which witnessed the Empire's extinction, we shall probably come to the conclusion that the change is not fully explained by the progressive weakening of the Imperial Power. This negative

¹ See IV. C (iii) (c) 3 (β), pp. 532 and 544, above.

factor would hardly have operated with such potent effect if it had not been reinforced by a positive increase in the strength of the Church; and if we inquire, in turn, into the causes of this advance in ecclesiastical authority, we shall discover two: one of them external to the life of the Church, and the other intrinsic to its development in this age.

The external factor which strengthened the hands of the Orthodox hierarchy in its successful opposition to the Imperial Government's policy of reconciliation with the Papacy was the force of feeling and opinion in the Orthodox Christian World, which became increasingly hostile to the West and therefore increasingly ready to allow the Church to mobilize it against the Imperial Government on behalf of an anti-Western policy.

From the moment when the two Christendoms first re-encountered one another upon the recovery of the Western World from the post-Carolingian interregnum,¹ they each displayed an instantaneous antipathy for the other. On the Western side this feeling declares itself with a ludicrous violence in almost every line of the report on his diplomatic mission to Constantinople in A.D. 968 which the North Lombard bishop Liutprand of Cremona wrote for his Saxon master the Western Emperor Otto I.² On the Orthodox Christian side the learned Imperial authoress Anna Comnena (*vivebat* A.D. 1083–*post* 1148), in her *Alexiad* or history of the life and times of her father the East Roman Emperor Alexius I (*imperabat* A.D. 1081–1118), displays a dislike for the Westerners and all their works which is not less intense for being less vulgarly expressed than Liutprand's animus against Anna's world.³ From

¹ For this interregnum see IV. C (iii) (c) 2 (β), pp. 322–3, above.

² See the *Legatio, passim*, in *Liutprandi Episcopi Cremonensis Opera* (ed. by Becker, J.: Hanover and Leipzig 1915, Hahn). It may be noted that this was Liutprand's second visit to Constantinople, and that, in his account of his first visit, which is also extant (see the *Antapodosis*, Book VI, in ed. cit., pp. 151–8), the emotional colour is by no means hostile. How are we to account for this change in Liutprand's feelings towards Orthodox Christendom during the comparatively short interval of nineteen years between A.D. 949 and A.D. 968? Is it simply a personal change which is to be explained by the fact that on his second visit he was in the service of a prince who at that moment was on bad terms with the Constantinopolitan Government? Or are we to detect in Liutprand's change of tone the reflexion of a general change for the worse in public feeling towards Orthodox Christendom throughout the Western World? In this connexion we may observe that Liutprand's Anti-Byzantinism, as he displayed it in A.D. 968, was not shared by all Liutprand's Western contemporaries. His own kinsmen, the Southern Lombards, continued to take kindly to Byzantine culture for at least another hundred years; and this was true *a fortiori* of those Italian communities—an Amalfi and a Naples and a Gaeta and a Ducatus Romanus—which had never fallen under Lombard rule. We have already noticed, in IV. C (iii) (c) 2 (β), p. 357, and in the present Annex, p. 600, above, the influence of Basilian monachism upon the religious life of the Ducatus Romanus of the tenth and eleventh centuries. The secular masters of Rome in the same age—the family of the Vestiaris Theophylact and their descendants the Crescentii and the Counts of Tusculum—were manifestly more 'Byzantine' than 'Transalpine' in their culture and their ethos. And even the Transalpine conquerors of Southern Italy came under the Byzantine spell from Otto II and Otto III to Frederick II inclusive.

³ See, for example, Anna's account of the Western invention of the cross-bow, which

that time onwards until the latter part of the seventeenth century this antipathy persisted on both sides; but, as often happens, the weaker of the two parties to the relation made up for its physical impotence by the vehemence of its feelings.

Within less than a hundred years of Anna's day these feelings had risen to such a pitch of intensity on the Orthodox Christian side that, when the people secured an accomplice on the Imperial throne in the person of the disreputable Comnenus Andronicus I (*imperabat* A.D. 1182-85), they instantly indulged in a general massacre of all the Western residents in the East Roman dominions.¹ The feelings which had prompted this atrocity were naturally not assuaged by the prompt and savage reprisals that were taken by the Sicilian Normans and the Venetians; and the detestation of Western Christendom in the Orthodox Christian World was burnt into the souls of all later generations when Venetian diplomacy diverted 'the Fourth Crusade' from Palestine to Constantinople, with the result that in A.D. 1204 the Imperial City was captured and sacked, and the East Roman Empire itself partitioned, by a piratical gang of Latin military adventurers.

Thereafter a rabid Anti-Westernism became the master-passion of the Orthodox Christian Society; and this was the one field in which the otherwise discordant nations of Orthodox Christendom, who had wrecked their common civilization by their internecine strife,² could bring themselves to make common cause. The Latin conquerors of the East Roman Empire found, to their dismay and their undoing, that the Bulgars—who, after 167 years of political servitude, had successfully thrown off the East Roman yoke in A.D. 1186, only eighteen years before the Latin conquest of Constantinople—were as implacably hostile to the Western interlopers as were their Greek co-religionists. This spirit in Orthodox Christendom not only frustrated the efforts of East Roman statesmanship to achieve a *rapprochement* with the West during the two centuries that followed the Greek reoccupation of Constantinople in 1261; in the

has been cited in III. C (iii), vol. iii, pp. 385-6, above. In dealing with Western people, as distinct from Western things, Anna reserves the cream of her invective for bespattering the Normans, who had, of course, surpassed all other Westerners up to date in the amount of injury that they had inflicted upon the East Roman Empire (and who, for that matter, were hated just as intensely, and with just as good reason, by their own fellow Westerners, and Anna's fellow victims, the Southern Lombards and the English). At the same time Anna arraigns all Westerners, without distinction, for their egotism, self-conceit, loquacity, impulsiveness, inconstancy, and boorishness (see the *Alexiad*, *passim*). Anna's contempt for the Western culture is vindicated by an *argumentum ad hominem* in her anecdote of the fighting priest (*Alexiad*, Book X, chap. 8).

¹ This Near Eastern atrocity of the year 1182 of the Christian Era may be compared with the general massacre of all the Roman residents in Asia Minor in the year 88 B.C.: a similar act of popular fury which was likewise committed under the aegis of a political adventurer who in that episode was King Mithradates Eupator of Pontic Cappadocia (see V. C (i) (c) 2, vol. v, p. 69, below).

² See IV. C (ii) (b) 2, p. 82, footnote 3, and IV. C (iii) (c) 2 (β), pp. 320-408, above.

same measure, it assisted the contemporary efforts of Ottoman statesmanship to impose the boon of political unification upon Orthodox Christendom by force. After a long and intimate and painful experience of both the two neighbouring societies the Orthodox Christians found the Ottoman version of Islam less unpalatable than the Latin version of Christianity; and when, in the end, they were forced to make the choice between Latin patronage and Ottoman domination, they did not hesitate to choose the latter as the lesser evil. The Greek grandee who declared in A.D. 1453, when Mehmed the Conqueror's hand was already raised above Constantinople to deliver the *coup de grâce*, that 'the turban of the Prophet' was preferable to 'the tiara of the Pope',¹ was accurately expressing in his mordant epigram the sentiments of all his co-religionists—Bulgars and Serbs and Rumans, as well as Greeks—who were now in the act of being united with each other, and divorced from the Christians of the West, through the triumph of a non-Christian Power.

Thus, from the eleventh century onwards, popular feeling fought potently on the side of the Orthodox Church in its contest with the East Roman Imperial Government over the capital question of Orthodox Christian relations with the West; but the Church's eventual victory over the East Roman State was not solely due to the support of this external ally in this part of the battle-field. The Church eventually established its ascendancy over the State not only in the matter of relations with the West but along the whole front on a battle-field that extended over almost every province of life; and this general change to the Church's advantage in the Balance of Power between Church and State must be ascribed to an intrinsic strengthening of the Church—both in organization and in *moral*—which began in the twelfth century² and continued thereafter.

When the Comnenian Dynasty (*imperabant* A.D. 1081-1185)³ temporarily rallied the East Roman Empire⁴ from the shock which

¹ Gibbon, Edward: *The History of the Decline and Fall of the Roman Empire*, ch. lxxviii, quoted already in I. B (iii), vol. i, p. 29, and in IV. C (ii) (b) 1, in the present volume, p. 71, above.

² At the turn of the eleventh and twelfth centuries the moral standing of the Orthodox Church had been low—the feebleness of the secular clergy being matched by the immorality of the regulars (for a careful yet vivid picture, see Oeconómos, L.: *La Vie Religieuse dans l'Empire Byzantin au Temps des Comnènes et des Anges* (Paris 1918, Leroux), chs. 6-9). The subsequent rally was heralded by the careers of Saint Christó-doulos and Bishop Eustathius.

³ These are the dates of the continuous rule of the Comneni as East Roman Emperors at Constantinople. They do not include the reign of the forerunner Isaac Comnenus (*imperabat* A.D. 1057-9), who stands to his Comnenian successors as the Holy Roman Emperor Rudolf of Hapsburg stands to the later Hapsburg wearers of the Western Imperial Crown. Again, these dates do not include the reigns of those acions of the Comnenian House who ruled at Trebizond over a local 'successor-state' of the East Roman Empire from A.D. 1204 to A.D. 1462.

⁴ For this rally see further V. C (ii) (b), vol. vi, p. 298, below.

it had received in the middle of the eleventh century through the simultaneous assaults of the Normans and the Saljuqs, they duly re-asserted the Imperial Government's 'Caesaro-papal' pretensions;¹ but this was not the leading note of the relations between State and Church in the new age. The forerunner of the new dynasty, Isaac Comnenus, had recompensed the Patriarch Michael Cerularius for his good offices in hoisting Isaac on to the Imperial Throne by transferring to the Patriarchate in perpetuity certain important rights of patronage and administration in ecclesiastical affairs which had hitherto been retained in the Imperial Government's hands. The *Restitutor Imperii*, Alexius I, himself made a momentous new departure, tantamount to an abandonment of 'Caesaro-papism' in principle, when he conceded civil as well as ecclesiastical autonomy to the Basilian monastic communities on the peninsula of Athos² and the island of Patmos;³ and at Athos this concession in principle obtained its full practical effect when the supervisory control over the monastic federal republic, which Alexius I Comnenus had retained in his own Imperial hands, was transferred to the hands of the Oecumenical Patriarch⁴ by the Emperor Andronicus II Palaeologus (*imperabat* A.D. 1282-1328).

The effect of Alexius's and Andronicus's generosity upon the fortunes of the Orthodox Church is comparable to the advantage which the Papacy secured in the West through the donations of Pepin and Charlemagne. 'The Holy Mountain', like 'the Holy See', became an inexpugnable stronghold from which the Church could confidently take the offensive against the Secular Power, in the knowledge that its opponent could never retaliate by cancelling the gift that it had irrevocably made. With Athos as their base of operations, a new party of 'Zealots' arose in the Orthodox Church in the course of the twelfth century, to do battle with the Photian-

¹ See Vasiliev, A. A.: *Histoire de l'Empire Byzantin* (Paris 1932, Picard, 2 vols.), vol. ii, pp. 121-2, and Oeconómos, L.: *La Vie Religieuse dans l'Empire Byzantin au Temps des Comnènes et des Anges* (Paris 1918, Leroux), chs. 4 and 6. The latter author gives chapter and verse for the view that 'les empereurs du xii^e siècle ne furent pas à l'égard de leurs patriarches plus tolérants que leurs prédécesseurs. Bien au contraire, le chef de l'Eglise byzantine est alors subordonné au basileus plus complètement que jamais' (p. 104).

² The monastery of the Great Laura, which was the nucleus of the cluster of monasteries on the Athos Peninsula, had been founded by St. Athanasius, the spiritual director of Nicephorus Phocas the younger, in A.D. 961, when the peninsula had once more become a safe place for monks to inhabit thanks to Nicephorus's success in destroying the nest of Andalusian pirates in Crete.

³ Vasiliev, op. cit., vol. ii, p. 124. For details of Alexius's act of cession of the island of Patmos to the would-be reformer of Basilian monachism, Saint Christódhoulos, see Oeconómos, op. cit., pp. 147-9; following the documents printed in Miklosich, F., and Müller, J.: *Acta et Diplomata Graeca Medii Aevi Sacra et Profana* (Vienna 1860-90, Gerold, 6 vols.), vol. vi, pp. 44-8.

⁴ Saint Christódhoulos' abortive monastic republic on the island of Patmos had been expressly exempted from the Oecumenical Patriarch's control by the terms of the Emperor Alexius I's charter (Oeconómos, op. cit., p. 149). For the history of the Patmian experiment see also Hussey, op. cit., pp. 190-3.

minded 'political'.¹ And the outcome of the Emperor Andronicus's act of placing Athos under the authority of the Oecumenical Patriarchate *de jure* was to enable the Mountain and 'the Zealots' to capture the Patriarchate *de facto* and to retain their control over it in perpetuity.² This *union sacrée* between the prelates and the monks of the Orthodox Church against the East Roman Imperial Government and the Papacy was both a consequence and a cause of the Imperial Power's decay. It could hardly have been achieved if the hierarchy had not ceased to be subservient to the Emperors or if the monks, on their part, had not ceased to need the support of the Papacy in order to set the Emperors at defiance. At the same time this alliance of the prelates and the monks, under the leadership of the latter, notably increased the fighting power of the Orthodox Church Militant,³ and proportionately decreased the Imperial Government's chances of carrying out a philo-Papal policy against the Orthodox Church's will.

Moreover, by that time the Patriarchate had at last established the right—for which it had fought so courageously against a Caesar Bardas and a Leo the Wise⁴—of censoring an Emperor's morals. In A.D. 1262 Andronicus II's predecessor on the Imperial throne, the redoubtable re-conqueror of Constantinople Michael Palaeologus, had been excommunicated by the Patriarch Arsenius in punishment for his crime of blinding his political victim the ex-Emperor John Lascaris; and, when Michael made the traditional Imperial retort of proclaiming the presumptuous cleric's deposition, Arsenius refused to consider himself deposed. From his place of exile at Proconnesus he exerted a greater spiritual influence over the Emperor's Orthodox subjects than he had wielded when he was in material possession of the Patriarchal Throne at Nicaea and Constantinople; and his moral victory was commemorated in the name of the Arsenites: a new party in the Church, who stood for ecclesiastical independence of the Imperial authority in spiritual things. A similar independence of mind was displayed, in a different cause, by John Vekkos, a cleric who was Arsenius's younger contemporary and who first made himself prominent as an opponent of Michael Palaeologus's project for the Union of the Churches. On this account Vekkos was imprisoned by the Emperor; and although he became a convert to the Unionist cause and was promoted by

² Vasiliev, *op. cit.*, vol. II, p. 360.

³ 'In matters of individual spiritual development, Emperor and secular clergy could only stand aside and share, or envy, the reverence which rich and poor alike gave to those monks whom they could recognize as holy men.'—Hussey, *op. cit.*, p. 119.

⁴ See pp. 597-9, above.

Michael to the Patriarchate in 1275, after the Union of Lyon, he proved the sincerity of his conversion when, in 1282, the Emperor Andronicus II revoked the Act of Union in deference to the prevailing current of feeling in Orthodox ecclesiastical circles. On this occasion Vekkos refused to abandon a cause which he had deliberately, and profitably, embraced, now that it had turned out to be unpopular; and he remained faithful to his Unionism until his death, thirteen years later, in prison.

In entrenching itself on Athos, and asserting itself in Constantinople, during the second, and culminating, phase of the Orthodox Christian 'Time of Troubles',¹ the Orthodox Church was equipping itself—no doubt unconsciously and unintentionally—for the task which was assigned to it by the great Ottoman statesman Mehmed the Conqueror. The ruthless Ottoman slayer and supplanter of the last of the East Roman Emperors not only gave a gracious investiture to a new Oecumenical Patriarch,² but proceeded to confer upon his creature Gennadius³ a jurisdiction to which no incumbent of the Oecumenical Patriarchate would ever have dreamed of aspiring so long as an East Roman Emperor or a Bulgarian Tsar or a Serbian Despot still retained his throne.⁴ The Pādīshāh Mehmed made the Patriarch Gennadius his *millet-bāshī* for the *Millet-i Rūm*, which, being interpreted,⁵ means that he made him the deputy-shepherd of all the Pādīshāh's *ra'īyeh* of the Orthodox Christian Faith throughout the Pādīshāh's dominions. Thus, when the Ottoman Empire attained its widest extent during the century that opened with Mehmed II's reign, the Greek Patriarch of Constantinople found himself—no doubt to his own bewilderment—reinstated over his former Greek flock, given authority over them in civil and temporal affairs, and empowered to exercise the same authority over his Greek subjects' Bulgar and Serb and Ruman and Greek and Arab co-religionists in the ecclesiastical domains of his own peers: the Patriarchs of Alexandria and Jerusalem and Antioch, the President of the Autocephalous Church of the Greek island of Cyprus, the Patriarch of Bulgaria, and the autonomous archbishops of Ochrida and Peč.⁶ At this moment of simultaneous

¹ For this relapse see V. C (ii) (b), vol. vi, pp. 298–9, below.

² See V. C (ii) (a), vol. vi, p. 203, footnote 4, below.

³ Gennadius was at this time the leader of the Anti-Unionist party in the Orthodox Church. Before taking his monastic vows he had been prominent, under his secular name of George Scholarius, as the private secretary of the Emperor John VIII Palaeologus and a supporter of the Union. He had been converted to the Anti-Unionist persuasion by Mark of Ephesus, who had been the leading 'Die-Hard' at Ferrara and Florence.

⁴ This point has been touched upon by anticipation in IV. C (iii) (c) 2 (β), p. 346, footnote 2, above.

⁵ For the Ottoman social and political system see Part III. A, vol. iii, pp. 22–50, above.

⁶ For the restoration of the 'autocephaly' of Peč (*Turcice İpek*) by Sultan Süleymān's Serb-born Grand Vizier, Mehmed Sököllü, in A.D. 1557, see Part III. A, vol. iii,

exaltation and abasement the Patriarchate of Constantinople at last justified the title of 'Oecumenical', which it had assumed nearly a thousand years before,¹ by effectively exercising at least a civil jurisdiction over the Orthodox Church throughout the World.²

It will be seen that, in a sense, the fortunes of the Oecumenical Patriarchate were made by the Ottoman conquest of the main body of Orthodox Christendom in the fourteenth and fifteenth centuries, somewhat as the fortunes of the Papacy had been made, a thousand years earlier, by the barbarian conquest of the Latin provinces of the Roman Empire in the fourth and fifth centuries of the Christian Era. During the intervening millennium the Papacy had first slowly built up an oecumenical dominion over Western Christendom and had then slowly lost the pre-eminent position that it had previously gained.³ It is curious to observe that the Oecumenical Patriarchate's belated rise approximately coincides, stage by stage, with the Papacy's decline and fall. The Oecumenical Patriarch Arsenius (*fungebatur* A.D. 1255-67), who brought the East Roman Emperor Michael VIII Palaeologus to a moral Canossa, was not far from being the contemporary of Pope Boniface VIII (*fungebatur* A.D. 1294-1303), at whose expense the spell of Papal invincibility was so brutally broken by Philip the Fair of France. The rise of 'the Zealots', and of Athos, was contemporaneous with 'the Babylonish Captivity' and the Great Schism; and the triumph of the secular power of the 'Osmanlis, who brought the whole of the Orthodox Christian World under the Oecumenical Patriarch's authority, was quickly followed in the West by the establishment of those modern parochial sovereign Powers that have now broken the Papal *Respublica Christiana* into fragments.

p. 40, footnote 1, above. The Greek imperialism of the Phanariots (see II. D (vi), vol. ii, pp. 222-8, above) procured the abolition of Sökölld's Serb Patriarchate of Peč in A.D. 1766; and in 1767 this Greek ecclesiastical triumph was crowned by the abolition of the West Bulgarian Archbishopric of Ochrida (Gibb, H. A. R., and Bowen, H.: *Islamic Society and the West*, vol. i (Oxford 1939, University Press), ch. 14). The Arabophone Orthodox community had long since felt the weight of a Greek ecclesiastical tyranny that was backed by the irresistible force of the Ottoman Government's political and military power. After the conquest of the metropolitan provinces of the Arabic World by Sultan Selim I (see I. C (i) (b), Annex I, vol. i, pp. 387-8, and IV. C (iii) (c) 3 (α), in the present volume, pp. 450-2, above) the first Orthodox Patriarch of Jerusalem who was a Modern Greek in nationality, Germanos II (*accessit* A.D. 1518: see Bertram, Sir A., and Luke, H. C.: *Report of the Commission appointed by the Government of Palestine to inquire into the Affairs of the Orthodox Patriarchate of Jerusalem* (London 1921, Milford), p. 23), prohibited the acceptance of Arabophone postulants in Orthodox monasteries and thereby excluded the Arabophones from all possibility of ever becoming bishops, since by this time it was one of the established conventions of the Orthodox Church that its bishops should be taken from the ranks of the regular clergy exclusively (Gibb and Bowen, op. cit., cap. cit.).

¹ See IV. C (iii) (c) 2 (β), p. 333, above.

² The whole of the Russian Church remained under the ecclesiastical jurisdiction of the Oecumenical Patriarchate from the conversion of Russia to Orthodox Christianity at the close of the tenth century (see II. D (vii), vol. ii, pp. 352-3, above) down to the establishment of the autonomous Patriarchate of Moscow in A.D. 1582-9.

³ See IV. C (iii) (c) 3 (β), pp. 512-84, above.

PAULICIANS, BOGOMILS, CATHARS

ANY religious community which has been branded as 'heretical' has suffered, *ex hypothesi*, the misfortune that has overtaken the Boeotians and the Philistines.¹ Its reputation has come to be at the mercy of victorious adversaries whose victory has been so complete that it has enabled them not only to stamp out, or keep under, the discomfited sect, but also to make sure that its features shall be known to Posterity through no other picture than the victors' own hostile and malevolent caricature. This was the fate of the Paulicians, until an authentic and original, though mutilated, liturgical book of the Paulician Church—*The Key of Truth*—was discovered² in 1891, and published in 1898, by an English scholar.³ Dr. Conybeare's edition of this text has thrown a wholly new light upon the character and history of a movement which both fascinated and puzzled Gibbon;⁴ and his introduction is a monument of scholarship and a mine of erudition—though it is unfortunately marred by an *odium theologicum* against the 'Incarnationist' (i.e. 'Conceptionist') persecutors of this 'Adoptionist' Church.⁵

From Dr. Conybeare's researches it would appear that the Paulician community was a piece of jetsam that had been deposited in the folds of the Taurus and Anti-Taurus Ranges⁶ by an archaic 'Adoptionist' wave of Christianity which preceded the 'Conceptionist' wave in spreading outwards from a common centre of dispersion in Syria⁷ but which was overtaken and obliterated by the pursuing wave on every sector of their common circular field of expansion except for one or two points where the jetsam cast up by the earlier wave was preserved high and dry in some mountain

¹ See II. D (ii), vol. ii, p. 50, above.

² The manuscript of *The Key of Truth* had been lodged in 1837 in the archives of the Holy Synod of the Gregorian Monophysite Armenian Church at Echmiadzin, after having been confiscated from a group of Paulician Armenians who had migrated from the Ottoman to the Russian side of the Russo-Turkish frontier in Transcaucasia after the Russo-Turkish War of 1828-9.

³ Conybeare, F. C.: *The Key of Truth: A Manual of the Paulician Church of Armenia*: the Armenian text edited and translated with illustrative documents and introduction (Oxford 1898, Clarendon Press).

⁴ See Gibbon, Edward: *The History of the Decline and Fall of the Roman Empire*, ch. liv.

⁵ In places, Dr. Conybeare's animus almost equals that which was once displayed by this latter-day Western scholar's 'Incarnationist' *bêtes noires* against their ancient 'Adoptionist' victims whom he has so chivalrously taken under his wing and so romantically idealized.

⁶ For other religious survivals in these secluded highlands see II. D (vi), vol. ii, pp. 257-8, above.

⁷ For this primitive 'Adoptionist' version of Christianity see Meyer, E.: *Ursprung und Anfänge des Christentums*, vol. iii (Stuttgart and Berlin 1923, Cotta), pp. 236-8.

fastness.¹ On the opposite edge of the field, 'Adoptionism' found another fastness in the mountains of Asturia, in the remote north-west of the Iberian Peninsula.² Dr. Conybeare hazards the speculation that another relic of 'Adoptionist' Christianity may be found in the Far Western Church of 'the Celtic Fringe', and that the irreconcilability of an 'Adoptionist' with a 'Conceptionist' Christology may have been the real stumbling-block in the way of a good understanding between the Church of St. Columba and the Church of Rome.³

The essence of the 'Adoptionist', as opposed to the 'Conceptionist', faith is a belief that Jesus was not born divine, but that in virtue of his human spiritual achievements and merits he was designated by God as the Son of God when, at the moment of his baptism, he was taken possession of by the Holy Spirit as a human vehicle for its divine activity.⁴ This 'Adoptionist' Christology has been nobly formulated by the statesman-theologian Paul of Samosata, who was Patriarch of Antioch from A.D. 260 to A.D. 272 and from whom the Paulicians appear to have derived their name.⁵

'In fixity and resoluteness of character he likened himself to God, and, having kept himself free from sin, was united to God, and was empowered to grasp, as it were, the power and authority of wonders. By these he was shown to possess, over and above the will, one and the same activity [with God], and won the title of Redeemer and Saviour of our Race. . . .

'We do not award praise to beings which submit merely in virtue of their nature, but we do award high praise to beings which submit because their attitude is one of love—and, so submitting, because their inspiring motive is one and the same, they are confirmed and strengthened by one and the same indwelling power, of which the force ever grows, so

¹ For the phenomena of concentric waves of dispersion and fossils in fastnesses see II. D (vi), vol. ii, pp. 255-9, with Annex; and II. D (vii), vol. ii, pp. 361-93, above.

² For this Asturian 'Adoptionism' see Conybeare, *op. cit.*, pp. clxx-clxxix. It was in the Iberian Peninsula that this form of Christianity assumed this name. For Asturia's historic role of serving as a fastness see II. D (vii), vol. ii, p. 362, footnote 4, and II. D (vii), Annex VIII, vol. ii, pp. 446-7, above, and V. C (i) (c) 3, vol. v, pp. 205-6, below.

³ Conybeare, *op. cit.*, pp. clxxx-clxxx. To a layman the evidence which Dr. Conybeare cites for this view may seem rather lacking in substance. Indeed, Dr. Conybeare is manifestly prone to espy suppressed and persecuted 'Adoptionists' everywhere. For the Far Western Church see II. D (vii), vol. ii, pp. 322-40, with Annexes II, III, and IV, above.

⁴ The Christology which Dr. Conybeare calls 'Incarnationist' ought properly to be called 'Conceptionist', since it holds no monopoly of the fundamental Christian belief that God has been incarnate in the human personality of Jesus on Earth. The reality of the Incarnation is not denied by the 'Adoptionists'. The point on which these differ from the 'Conceptionists' is in regard to the moment in the human life of Jesus at which the Incarnation took place. According to Mark it took place, not at the moment of Jesus's conception in his mother's womb, but at the moment of his baptism by John in Jordan. This 'Adoptionist' Marcan Christology still shimmers through the 'Conceptionist' veneer with which it has been overlaid in the Gospels according to Saint Matthew and Saint Luke, and it is not contradicted in the Gospel according to Saint John (see further V. C (ii) (a), vol. vi, pp. 267-75, below).

⁵ See p. 627, below.

that it never ceases to stir. It was in virtue of this love that the Saviour coalesced with God, so as to admit of no divorce from him, but for all ages to retain one and the same activity with him—an activity perpetually at work in the manifestation of good.¹

Holding this belief about the means by which a human Jesus became a Christ the Son of God, the 'Adoptionists' were led into the further belief that a human follower of Jesus who went through the same spiritual struggle under the inspiration of the same love might win the same guerdon if he were admitted to the same rite of baptism at the same age. The eighth-century 'Adoptionists' of Asturia were said to say 'Et ille Christus, et nos Christi';² and the dogma is elaborated in the *symbolum fidei* of their leader Elipandus: 'Si conformes sunt omnes sancti huic filio Dei secundum gratiam, profecto et cum adoptivo adoptivi, et cum advocato advocati, et cum Christo Christi'.³ In the first half of the ninth century the great Paulician missionary in the East Roman Empire, Sergius, appears to identify himself with Christ in a passage from an alleged epistle of his which is quoted by the Greek Orthodox controversialists of the age.⁴ One of the Paulician *émigrés* from Ottoman to Russian territory in 1837⁵ deposed, in a recantation made to the authorities of the Gregorian Church, that he had heard a certain Gregory of Kalzwan, who was one of the Paulician adepts, say: 'Behold, I am the Cross; light your tapers on my two hands, and give worship. I am able to give you salvation, just as much as the Cross and the Saints.'⁶

This 'Adoptionist' version of Christianity was not only pre-'Conceptionist'; it was also pre-iconic, pre-hierarchical and pre-monastic. Arianism was a sophisticated version of it, Nestorianism a partial reversion to it, Iconoclasm an excerpt from it—an excerpt which was so ample in the Hyper-Iconoclasm of the Emperor Constantine V that Conybeare claims him as a Paulician in all but name.⁷

The name 'Paulician' proves, on philological analysis, to have been given to the sect by their opponents in an Armenian-speaking social milieu; for 'Paulician' is an Armenian adjectival form denot-

¹ Passages quoted, from the surviving fragments of Paul of Samosata's *Discourses to Sabinus*, by F. C. Conybeare in *The Encyclopaedia Britannica*, eleventh edition, s.v. 'Paul of Samosata'.

² Just as the adepts in the worship of Osiris became Osirides (see I. C (ii), vol. i, p. 143, above) and the Bacchanals Bacchi. This notion is less repugnant to the Orthodox than it is to the Western branch of the Catholic Church. For deification (*θεωσις*) as the goal of Orthodox Christian mysticism see Hussey, J. M.: *Church and Learning in the Byzantine Empire, 867-1185* (Oxford 1937, University Press), chap. ii.

³ These passages are quoted by Conybeare, in op. cit., pp. clxxxiii and clxxv, from the *Epistula Heterii et Sancti Beati ad Elipandum*, a Catholic attack on the heretic which was composed in A.D. 785.

⁴ Conybeare, op. cit., pp. li-lij.

⁵ Conybeare, op. cit., pp. xxvii and lii.

⁶ See p. 624, footnote 2, above.

⁷ Ibid., pp. xlii and cxvi-cxvii.

ing association with 'Paulik'; and 'Paulik' is a derogatory Armenian diminutive of 'Paul'. This depreciatory element in the formation of the word shows, further, that the Paul with whom the sect was thus insultingly associated cannot have been St. Paul the Apostle; and there is, in fact, positive evidence that they were named after Paul of Samosata. The derivation of their tenets from this third-century heresiarch is expressly asserted by the Byzantinized Armenian Gregory Magister¹ who persecuted the Paulicians of Armenia, on the East Roman Government's account, in the sixth decade of the eleventh century; and this testimony is borne out by a comparison of *The Key of Truth* with the authentic fragments of Paul of Samosata's doctrine that have survived. In short, the Paulicians were the spiritual descendants of the 'Pauliani' who were condemned by the Council of Nicaea in A.D. 325.²

One seventh-century Paulician missionary, however, seems to have been so little aware of the origin of the faith which he held and propagated that he accepted the abusive *sobriquet* which the sect had received from its enemies and proceeded to identify the Paul, to whom the sect was referred, with the Apostle himself. This Pauline Paulician was the Constantine who came from the North-East Armenian district of Mananalis (next door to the present village of Chaurm, which was the home of the Paulician *émigrés* of A.D. 1837)³ and who founded a new branch of the Paulician Church in the Greek-speaking territory of the East Roman Empire in North-Eastern Anatolia, west of the Euphrates, in A.D. 660. This Constantine took the Pauline name of 'Silvanus', and he called his new church 'Macedonia'. His successors followed his example—four of them taking, respectively, the names of 'Titus', 'Timotheus', 'Epaphroditus', and 'Tychicus', and calling their new foundations 'Achaia', 'Philippi', 'Laodicea', 'Ephesus', and 'Colossae'.⁴ This group of Paulician churches on East Roman ground is the best known part of the Paulician Church, because it was this group that came into collision with the East Roman Government in the ninth century and that propagated the faith in Europe. But this Pauline conceit appears to have been peculiar to them, and to have been unknown in the earlier home of the Paulician Church in the Armenian territories on the other side of the Euphrates.⁵

There is no other evidence that the Paulicians were especially devoted to the Apostle Paul, and there is no evidence at all that this alleged attachment to Paul led them (as their enemies averred)

into displaying a hostility towards Peter. *The Key of Truth* merely declares that the Church rests on all the Twelve Apostles, and not on Peter alone;¹ and in the Paulician liturgy for the ordination of the elect, which is preserved in this book, the candidate appears actually to receive the ritual name of Peter at the hands of the officiant, as a sign that he has become, like his Apostolic namesake, a rock on which the Church is built and an authority empowered to bind and to loose.²

Again, the Paulicians were neither Marcionites (as certain modern scholars have conjectured) nor Manichaeans (as their contemporary Catholic opponents persistently asserted in order to defame them with an odious name).³ Both the Greek and the Armenian Anti-Paulician controversialists testify that this sect, which they sought to brand as Manichaean, actually anathematized Mani;⁴ and one of these Armenian theologians, the Gregorian Catholicus Nerses Shnorhali (*fungebatur* A.D. 1165–73), who attacks his Paulician contemporaries, also testifies to the existence, in his day, of genuine Manichees in Armenia who were quite separate from the Paulicians, and whom the Catholicus deals with in a different context.⁵ The Paulician and the Manichaean Church resembled one another in being divided into two orders, and two only, of the *catechumeni* or *auditores* on the one hand and the *electi* or *perfecti* on the other, and also in making the *electus* an object of ritual adoration. But these common features are also to be found in other religions—e.g. the Orphic Faith—which may have been their common source; and the differences that they display are more striking: for example, the Manichaean *electi* were celibate, vegetarian ascetics of an Indic type, whereas the Paulician *electi* had to be married and to bring up children and to earn their own living, like other men.⁶ The Paulicians were not only pre-monastic but were also anti-monastic; and we may reasonably trace to them the anti-monastic vein in the Iconoclasm of Leo III and Constantine V. The only evidence that the Paulicians—or the Bogomils or the Cathars—were Manichaeans, in the sense of holding dualistic views of a Zoroastrian type, comes from the mouth of their enemies;⁷ and this evidence must be heavily discounted, since these enemies, having once branded them with the Manichaean name, would very readily attribute to them, *a priori*, all the tenets which the authentic Manichaeans were recorded to have held.⁸ As a matter of fact, in the crucial field of

⁴ Conybeare, *op. cit.*, pp. cxxiii and cxxxi.

⁵ *Ibid.*, pp. xlv–xlvii.

⁶ 'Orthodox Christians often used the word "Manichaean" to describe heretics whose doctrines were imperfectly understood but seemed to impugn the goodness of God or the salvability of the human body. The Bogomils of Bulgaria, the "Cathari" and

Christology the authentic Manichees stood much nearer to the Catholics than to the Paulicians, as appears from *The Acts of Archelaus*, a controversial theological dialogue purporting to have been held in the eighth decade of the third century between Mani and a certain Archelaus who is described as being the Bishop of Kashkar in Lower 'Irāq. In this dialogue the 'Conceptionist' position is maintained by the founder of the Manichaean Faith, while his Christian opponent maintains the 'Adoptionist' position which was afterwards the cardinal tenet of the Paulicians.¹

Finally, we can discard the conjecture that either the seventh-century 'Adoptionism' of the Armenian Constantine of Mananalis or the eighth-century 'Adoptionism' of the Spaniard Elipandus of Toledo was a direct and deliberate reaction of the local Christian Church to the impact of Islam. On this view 'Adoptionism' was a post-Muhammadan movement which was designed to keep the

"Patarenes" of Lombardy, and above all the Albigensians, have often been called Manichees in ancient and modern times. It is likely that fragments of their teaching were really derived from Manichaean sources. But, now that we have so much more exact knowledge of what the Religion of the Manichees really was, I think it misleading to call these sects, even the Albigensians, by the name of Manichees. In any case it is hazardous to use Albigensian material to illustrate the religion we are studying."—Burkitt, F. C.: *The Religion of the Manichees* (Cambridge 1925, University Press), pp. 11-12.

Catholic writers, convinced that the Albigenses were Manichaeans, were content to go to the works of Saint Augustine against the Manichaeans and to attribute indiscriminately to the Albigenses all the errors enumerated in those pages. Such a procedure, not necessarily adopted in any spirit of conscious unfairness, was so obviously unscientific that it makes it difficult to use the evidence of these writers with any confidence."—Turberville, A. S., in *The Cambridge Medieval History*, vol. vi (Cambridge 1929, University Press), p. 699.

After the close of the twelfth century the Catholic polemics against the heresy laid their principal emphasis upon . . . the heretics' dualistic speculations and upon the outgrowth of these—the more eagerly because in these questions Catharism was least able to justify itself by [its favourite argument of] appealing to the New Testament. This exercised such a persistent influence on subsequent views about the heresy that, ever afterwards, this dualism was assumed to be the heresy's kernel and foundation, and all the other tenets were disposed of as mere corollaries of this one. In reality, however, down to the end of the twelfth century, it is not the speculative problems of dualism, but invariably the questions of the religious life and of the Church that are at the heart of the controversy between Heresy and Catholicism. At the first appearance of the heresy in the West, in the first half of the eleventh century, its tenets include, so far as we know, no dualistic doctrines whatsoever. Nevertheless the Catholic literature on the subject styles the heretics "Manichaeans" from the outset. And this practice has often seduced the ecclesiastical polemicists into looking up, in the works of Augustine, what the teaching of the Manichaeans was, and then simply ascribing this teaching to the heretics of the writers' own time. [In a footnote the author cites examples of this practice—A.J.T.] Where this is not the case—where, that is to say, we can be certain, beyond possibility of mistake, that our source is reproducing the genuine convictions and teaching of the contemporary heresy—and more especially in all official ecclesiastical documents dealing with the heresy question, there is either no trace at all of dualistic speculations, or else these speculations retire quite into the background."—Grundmann, H.: *Religiöse Bewegungen im Mittelalter* (Berlin 1935, Ebering), pp. 24-5. Cf. p. 17.

¹ For *The Acts of Archelaus* see Conybeare, op. cit., pp. xcvi-civ. There seems to be some uncertainty about the location of the bishopric that is attributed to Archelaus in this work. If it is the city and district in Lower 'Irāq which are known as Kashkar in Syriac and as Kaskar in Arabic, then the scene of the dialogue has been laid next door to Mani's home-country, Mesene. If, on the other hand, Archelaus's see is, as Conybeare suggests, to be found, not in Lower 'Irāq, but in Middle Kurdistan, at Kharkar (not Kashkar), this would be not so far from Paul of Samosata's see of Antioch.

Christian flock within the fold by revising certain features of the Christian Faith which were particularly vulnerable under a Muslim attack. The theory, however, is decisively refuted by two facts. In the first place the 'Adoptionist' Christology, so far from being post-Muhammadan, is, as we have seen, pre-Nicene, and it can be detected in so early a Christian document as *The Shepherd of Hermas*. In the second place the Primitive Muslim Arab conquerors were not concerned to convert their Christian subjects and neighbours outside the limits of Arabia itself. In their non-Arabian dominions they preferred to keep the non-Muslim 'People of the Book' as supertax-payers, rather than convert them at the expense of the public revenues of the Caliphate.¹ Hence the pastors of the Christian flock in or near the Arab Empire were under no pressure at that time to forestall a threatened secession of Christians to Islam by revising their Christology in an Islamic direction. So far as there is any resemblance between the Islamic and the Paulician Christology, this is to be traced to the influence, upon Islam, of Nestorianism; for Nestorianism was a partial reversion to the 'Adoptionist' position which the Paulicians had never abandoned. In so far as Islam did influence the fortunes of the surviving remnant of the 'Adoptionist' Church, this influence was unintentional and indirect.

In both its Armenian and its Spanish fastness this archaic form of Christianity was stirred into fresh activity and dragged out into the light in the eighth century of the Christian Era through the accident that in that age both these fastnesses were violated. The highlands of the Taurus and Anti-Taurus now became a debatable borderland between the Arab Caliphate and the East Roman Empire,² while the highlands of Asturia came to play a similar role between the Caliphate and the Austrasian Frankish Power.³ Therewith, two regions which had both hitherto lain secluded and ignored, far off from the main thoroughfares of the life of the World, rather suddenly acquired an unprecedented importance and notoriety as crucial war-zones and vital marches between contending empires;⁴ and both the two resuscitated ghosts of the Roman Empire were thereby compelled to adopt a definite attitude towards the ancient form of their religion which they each now rediscovered on their respective Syriac frontiers. In these parallel circumstances the Austrasian and East Roman statesmen took opposite lines—Charlemagne lending his authority to an attempt to suppress the Asturian 'Adoptionist' Elipandus, while Leo Syrus—whose family came

¹ See IV. C (iii) (b) 12, p. 226, above, and V. C (i) (d) 6 (δ), Annex, vol. v, pp. 674-7, below.

² See IV. C (iii) (c) 2 (β), p. 365, footnote 4, above.

³ See II. D (vii), Annex VIII, in vol. ii, above.

⁴ For the literary consequences see V. C (i) (c) 3, vol. v, pp. 252-61, below.

from Germanicea,¹ next door to the birthplace of Paul of Samosata—apparently drew inspiration from the remnant of the 'Adoptionist' Church in the Anti-Taurus for launching a new religious movement of his own which he attempted to impose by force upon Orthodox Christendom.

The outcome of this encounter between Paulicianism and Orthodoxy, which began with the opening of Leo's iconoclastic campaign in A.D. 726 and ended with the collapse of the Paulician Republic of Tephrike between A.D. 871 and 875, has been touched upon already in the present volume.² In this Annex it only remains to support the statement, which has been made in the same place,³ that the Cathars of Lombardy and Languedoc, as well as the Bogomils of Bulgaria and Bosnia, were direct offshoots of the Asiatic Paulician Church.

The substantial identity of the Paulician, the Bogomil, and the Cathar faith is not in doubt. The common features are too similar and too numerous to be explained away as fortuitous,⁴ and it is clear that we are in the presence of a single religion masquerading under different names in different places. The only question at issue is whether the Bogomils and the Cathars were European converts of the Paulicians—which would mean that they only became 'Adoptionists' in an age posterior to the transplantation of Paulician *émigrés* from the regions of Malatyah and Erzerum to Thrace in A.D. 756 (or 755)⁵—or whether they were respectively descended from local 'Adoptionists', which would mean that their 'Adoptionism' was as ancient as that of the Paulicians themselves and that they were separate and independent relics of the same archaic pre-Nicene wave of Christian propaganda.

This second view is advocated by Dr. Conybeare;⁶ and the opinion of a scholar who is a past-master in this subject is evidently entitled to the greatest respect. Yet a layman may perhaps hazard the opinion that on this point Dr. Conybeare's scholarship has been

¹ See III. C (ii) (b), vol. iii, p. 274, footnote 2, above.

² See IV. C (iii) (c) 2 (β), pp. 364-6, above.

³ In IV. C (iii) (c) 2 (β), pp. 366-9, above.

⁴ For example, the Albigenes and their contemporary co-religionists in the Rhineland not only made the *electus* an object of ritual adoration (see Conybeare, op. cit., pp. lv-lvii and cxxxiv-cxxxv); they also conferred the ritual name of Peter upon the recipient of their rite of *consolamentum* (see Conybeare, op. cit., pp. cxliii and clxv).

⁵ Theophanes, who reports this transplantation *sub anno mundi* 6247 (= A.D. 756 or 755), observes that it resulted in a diffusion of the Paulician heresy. It was, indeed, to be expected that these *émigrés* would include a considerable number of Paulicians, since the migration was evidently *en masse*, while the regions from which the settlers came all lay within the triangle between Samosata (the home of Paul), Manalalis (the home of Constantine-Silvanus), and Colonea (the field of Constantine-Silvanus's missionary labours). Theophanes does not tell us whether there were any Paulicians as well as Monophysites among 'the heretic Syrians' whose deportation to, and settlement in, Thrace he records *sub anno mundi* 6270 (= A.D. 778) (see IV. C (iii) (c) 2, p. 367, footnote 5, above).

⁶ Conybeare, op. cit., pp. cxlvi-cl and cxevi.

biased by his *odium theologicum*. He has formed a mental picture of the 'Incarnationist' (i.e. 'Conceptionist') Catholic Church as an oppressive institution with a precarious tenure—holding down, temporarily and by force, an older 'Adoptionist' Christianity which has not only been the first in the field everywhere but has also managed everywhere to hold its ground and to reassert itself against its oppressor in the fullness of time. This picture shows up the Catholic Church as a usurper without legitimate title, and reveals the latent 'Adoptionist' Church as the true heir of the Primitive Church Universal.¹ The undisguised pleasure which Dr. Conybeare takes in this view of the history of Christianity gives his readers cause to suspect that he may have unconsciously pushed the evidence in support of it rather farther than it will really go. A case in point is his attempt to claim the Celtic Church² as a part of his ubiquitous 'Adoptionist' Church; and the *reductio ad absurdum* of the view is the suggestion³ that the Bogomils of Bulgaria may have been descended from the local 'Adoptionists' of the Balkan Peninsula, instead of being converts of the Asiatic Paulicians⁴ who are known to have been planted on the Bulgarian frontier of the East Roman Empire in A.D. 756 (or 755) by Constantine V, to have been reinforced in the eighth decade of the tenth century by John Tzimisces, and to have survived at Philippopolis—where John Tzimisces had planted them—till the eighteenth century.⁵ On the eve of the collapse of the Paulician Republic of Tephrike, its indomitable citizens were planning to enter into competition with the Church of Constantinople and the Church of Rome for the spiritual conquest of Bulgaria—according to the testimony of a Greek witness, Petrus Siculus, who spent nine months at Tephrike in A.D. 870⁶—and we can hardly doubt that

¹ 'The Adoptionist Church remained one and undivided, and was unaffected by the scission of East and West. . . . Thenceforward the only real union of East and West was a union of heresy or heresies, and the only bond between the great persecuting churches was their common hatred of the persecuted sects. There continued after the fourth century the same unrestricted intercourse between the Adoptionists of the West and those of the East as there had been up to that age' (Conybeare, *op. cit.*, p. 126). Here, surely, we can see the critical scholar changing, before our eyes, into the pious composer of an edifying legend.

² See p. 625, above.

³ In *op. cit.*, p. cxcvi.

⁴ For the relation between the Asiatic Paulicians and the Bogomils see IV. C (iii) (c) 2 (β), pp. 367–8, above.

⁵ For the survival of Paulicians (not Bogomils) at Philippopolis Dr. Conybeare himself (*op. cit.*, pp. cxxxviii–cxxxix) cites a letter of Lady Mary Wortley Montague's, dated Adrianople, 1st April, 1717. The Emperor Alexius I Comnenus (*imperabat* A.D. 1081–1118) had found the descendants of John Tzimisces' Paulician deportees ensconced in Philippopolis cheek-by-jowl with a community of Bogomils and another community of Armenian Monophysite Christians (possibly descended from the deportees of A.D. 778); and he had made a determined attempt to convert them to Orthodox Christianity—but this without success, though he had resorted to force when argument had proved of no avail (Anna Comnena: *Alexias*, Book XIV, chs. 8–9). The same emperor was equally unsuccessful in a subsequent attempt to convert the Bogomils (Anna Comnena, *op. cit.*, Book XV, chs. 9–10).

⁶ See Petrus Siculus: *Historia Manichaeorum seu Paulicianorum*, ad init. et ad fin. (cited in IV. C (iii) (c) 2 (β), p. 367, footnote 6, above).

the Bogomil Church is a monument of the successful execution of this project, which the Paulicians who were already established in Thrace were doubtless able to expedite. The debatable case is that of the Albigenses; for, even if there is no evidence for the existence of a primitive 'Adoptionist' Church in Gaul, the existence of 'Adoptionism' in the North of Spain in the latter part of the eighth century is well attested; and on *a priori* geographical grounds it would, no doubt, seem more credible that the twelfth-century 'Adoptionism' of Languedoc should be derived from eighth-century Spain than that it should have to be traced all the way across Europe and Asia Minor to eighth-century Armenia. Nevertheless there are certain pieces of evidence—and these are placed in our hands by the conscientious scholarship of Dr. Conybeare himself—which do suggest that the more remote derivation is the true one.

For instance, we find some German representatives of a school of heretics who, 'having taken their rise in Gascony, from some unknown author, had multiplied like the sand of the sea in France, Spain, Italy and Germany', being convicted at Oxford in A.D. 1160 under the name of *Publicani*; in 1179, again, the *Publicani* are condemned, by name, by the Third Lateran Council, and are expressly identified with the Albigenses, Cathari, and Patarini; and this word *Publicani* is simply a Latinization of *Pauliciani* in its contemporary Greek pronunciation.¹ Now the name 'Paulicians' does not seem to have attached to the eighth-century Spanish 'Adoptionists', or even to the Armenian Paulicians east of the Euphrates, who are called Thonraketzi (i.e. inhabitants of the district of Thonrak) by their Gregorian compatriots. The name only attaches with certainty to the North-East Anatolian followers of Constantine of Mananalis; and we may fairly infer that, if the name of this Anatolian 'Adoptionist' community is borne, five centuries after Constantine's time, by the twelfth-century 'Adoptionist' Church in Languedoc, then the 'Adoptionist' Faith itself, as well as its Asiatic title, must have come to the valley of the Garonne from the valley of the Euphrates.

There is also a piece of etymological evidence for the passage of the Cathar Faith from Tephrike to Albi via the valley of the Maritsa; for in medieval France the popular term of abuse for the Cathars

¹ Conybeare, *op. cit.*, pp. cxxxix-cxl. Dr. Conybeare suggests (*op. cit.*, p. cxlvii) that in the latter part of the twelfth century the Paulician name was learnedly applied to indigenous Gallic 'Adoptionists' by Western Catholic divines who had already come across the Paulicians in the Levant in consequence of the Crusades and who perceived that the two sects were identical in their beliefs. Such a discovery, however, is more in the line of a twentieth-century student of 'comparative religion' than in that of a twelfth-century inquisitor, and in fact the medieval Western adversaries of the Albigenses betray in their own polemics the haziness of their knowledge of the tenets which they were endeavouring to refute. (On this point see the present Annex, p. 628, footnote 8, above.)

—and, by analogy, for heretics in general—was *Bougres* (i.e. Bulgars).¹ And, apart from this presumptive evidence, we find a connexion between the Cathars of the West and the Bogomils of the Slavinas explicitly attested by contemporary Western observers. It is recorded, for example, that there were delegates from Bulgaria at a General Council which was held by the Cathars in the neighbourhood of Toulouse in A.D. 1167.² And this statement is reinforced by further evidence which dates from the thirteenth century, when, owing to the work of the Inquisition, the beliefs and practices and affiliations of the Cathars had come to be rather better known than they had been in the latter part of the twelfth century, when the existence of the sect in the West had first begun to attract attention. *Sub anno* 1223 Matthew Paris chronicles a report that the Albigenses paid allegiance to a Pope who lived on the confines of Bulgaria, Croatia, and Dalmatia;³ and another Western writer, whose *floruit* was in the middle of the thirteenth century, states that the various Cathar churches of Europe—of which he gives a list ranging from Northern and Southern France and Northern and Central Italy to Slavonia and Constantinople—are all derived from the two parent churches of Bulgaria and 'Dugranicia' (? po-Granica, Krain, Carniola).⁴ Conybeare seeks to explain this twelfth-century association by the hypothesis that by this time the ancient 'Adoptionist' churches of Western and South-Eastern Europe, having now each emerged from their respective lurking-places, had recognized and joined hands with one another. But this hypothesis does not explain how it was that the West European Cathars had come, not only to admit their kinship with their brethren in the Balkans, but also to concede to the latter a primacy in the Faith. The natural explanation of this fact is that which is given by the contemporary Western authorities for it, who explain it by telling us that the Catharism of the Balkans was the *fons et origo* of Catharism in the West. We may therefore allow ourselves to believe, *pace* Dr. Conybeare, that the Western *Publicani* were really spiritual descendants of the Anatolian Paulicians through the Balkan Bogomils.

IDOLATRY AND PATHOLOGICAL EXAGGERATION.¹

It is a commonplace that idolatry, in the narrower technical sense, runs to pathological exaggerations of which the legendary sacrifice of Iphigenia in Aulis—*tantum religio potuit suadere malorum*²—and the authentic ritual of human sacrifice in Mexico³ and procession of Juggernaut's car in Bengal are three classic examples. The same tendency can be observed in a number of other manifestations of idolatry in the broader sense in which the term is used in this Study; and this wider range of the same phenomenon is worth glancing at, because idolatry is one of those things whose essence is illuminated, and not obscured, by caricature.

As our point of departure, we may take a passage from the pen of Monsieur Bergson:

'Is Primitive Humanity accurately mirrored in the "primitives" who are under our observation to-day? That seems improbable, since among them, as among ourselves, Nature is covered by a thick layer of habits which have been preserved by the social milieu and which are deposited by it in each individual. There is reason, however, to believe that this layer is here not so thick as it is in Civilized Man, and that it allows Nature to show through more transparently. The multiplication of habits in the course of centuries must, indeed, have operated among the primitives in a different way—operated, that is, on the surface, by a passage from analogue to analogue, and under the influence of accidental circumstances, in contrast to the progress of technique or of knowledge or, in short, of civilization—a progress which continues in some one single direction over quite long periods, and which is not superficial but cumulative, inasmuch as it is produced by variations which are superposed upon, or dovetailed into, one another, and which accordingly result in profound transformations and not just in superficial elaborations. . . .

It must not be forgotten that the primitives of to-day or yesterday have lived through just as many centuries as we have, and that they have thus had plenty of time to exaggerate—or, as one might put it, to exacerbate—whatever irrational elements there may have been in primitive tendencies which, in themselves, were natural enough. The true primitives were almost certainly more sensible, if [we may assume that] they kept within the limits of the tendency and of its immediate effects. [But] everything is subject to change, and, as we have stated above, the change will take place on the surface if it cannot work down into the depths.

¹ This Annex has a bearing on IV. C (iii) (b) 1, above, as well as on the chapter to which it has been attached.

² Lucretius, *De Rerum Natura*, Book I, l. 101.

³ See the ghastly description in Frazer, J. G.: *The Golden Bough*, 3rd edition, part vi: *The Scapegoat* (London 1913, Macmillan), ch. 7.

There are societies which progress . . . and the change here takes the form of an increase in intensity: its direction is relatively constant, and the movement is towards an ever higher degree of efficiency. On the other side there are societies which [just] keep their level—and this, necessarily, a low one. Since these societies [likewise] change all the same, there occurs in them something which is no longer the intensification implied in qualitative progress, but is a multiplication or exaggeration of what has been there to start with. In this domain, invention—if the word is still applicable—no longer demands effort. A belief which once responded to a need leads to a new belief which bears an external resemblance to its predecessor and accentuates some one of its superficial characteristics, but which no longer serves any purpose. Thenceforward the society marks time, adding and amplifying incessantly. Through the twofold operation of repetition and exaggeration, irrationality turns into absurdity, and oddness into monstrosity.¹

The pathological exaggeration which is here presented to us by a modern Western philosopher as the characteristic penalty of an infatuation with a particular phase of human social life, displays itself in general in two variant forms. The simpler form is a sheer augmentation of size; the slightly more sophisticated form is an unhealthy exaggeration of characteristic features. The augmentation of size may take place in either one or two or three dimensions.

A hideous illustration of the one-dimensional augmentation is the immoderate growth of a rat's tooth upon the loss of the corresponding tooth, in the opposite jaw, which normally grinds, and is ground by, it. If this natural check is removed, the tooth that no longer has an 'opposite number' to keep it within bounds will proceed to grow *ad infinitum* until it has tortured its wretched owner to death by first making it impossible for him to close his mouth and then, if it is a lower-jaw tooth, transfixing his palate and piercing his brain.

The human analogue of this super-toothed rat is the Macedonian phalangite, whose pike (*sarisa*), like the rat's tooth,² ran incontinently to length as soon as it was left without any 'opposite number' to keep its elongation within reasonable limits. The virtue of this Macedonian pike lay in its outranging the Theban or Spartan spear without outweighing this advantage by simultaneously reducing the mobility of the pikeman;³ and for this purpose the mini-

¹ Bergson, H.: *Les Deux Sources de la Morale et de la Religion* (Paris 1932, Alcan), pp. 133 and 143; cf. pp. 171 and 182.

² For the conception of human tools as detachable limbs, or of animal limbs as undetachable tools, see Part III. A, vol. iii, pp. 79–88, and III. C (i) (c), vol. iii, p. 177, above.

³ The Spartan hoplite's spear was the longest weapon that could be manipulated with one hand, and used for stabbing, over the rim of the large round shield with which the hoplite's other hand was occupied. The Macedonian phalangite was able to manipulate a pike that outranged this Spartan spear because he gave both hands to it at the price of diminishing his defensive equipment by contenting himself with a small round target

mum, and therefore optimum, length of pike-staff was eighteen feet. It was with an eighteen-foot-long pike that the phalangites of King Philip II and Alexander the Great defeated all-comers;¹ but the *sarisa* had no sooner borne down all resistance, and made itself the master-weapon in the world of the day, than it sprouted—in a boundless competition with itself—to a length which transformed it from a potent weapon into a fatal encumbrance. In the generation of the Diadochi the Spartan captain Cleonymus (*vivebat circa* 330–270 B.C.), finding himself in command of an old-fashioned Spartan phalanx and facing a Macedonian phalanx in which the pike was now twenty-four feet long instead of eighteen, won a crushing victory by the simple expedient of making his two front ranks discard their spears, seize the enemy's unwieldy pikes in their naked hands, and hold them immobilized while the rear ranks filed round and stabbed the helpless pikemen to death from the flanks and the rear at their leisure.² On this occasion the Macedonian phalangite met the toothy rat's miserable fate; and after this melancholy experience the length of the *sarisa* was cut down again. But it was only cut down from twenty-four feet to twenty-one;³ and this compromise still left the length so excessive that it not only debarred the Macedonian pikeman from all prospect of winning any more victories, but condemned him to be massacred *en masse* when, at Cynoscephalae in 197 B.C. and at Pydna in 168 B.C., he had to contend with the Roman swordsman.⁴

that was slung on the left elbow. The first step in the process of lengthening the spear and simultaneously lightening the shield seems to have been taken by the Athenian *condottiere* Iphicrates in 374 B.C. (Parke, H. W.: *Greek Mercenary Soldiers* (Oxford 1933, University Press), pp. 79–80, quoting Diodorus: *A Library of Universal History*, Book XV, ch. 44). And the equipment of the Macedonian phalangite seems to have been a development of the Athenian *condottiere's* invention (Parke, *op. cit.*, pp. 155–6 and 236). The Spartan phalanx itself was eventually re-equipped in the Macedonian fashion by King Cleomenes III towards the end of the third quarter of the third century B.C. (Plutarch's *Lives of Agis and Cleomenes*, ch. 32).

¹ The figure of eighteen feet, as a maximum length, is attested by an incidental reference in one of the works of a contemporary Hellenic man of science, Theophrastus of Eresus (*Historia Plantarum*, Bk. III, ch. 12, § 2. N.B. Kromayer, J., and Veith, G., in *Heerwesen und Kriegsführen der Griechen und Römer* (Munich 1928, Beck), p. 134, interpret this passage of Theophrastus as implying that, in that age, the different ranks of the phalanx were equipped with *sarissae* of different lengths). In all the figures for the length of the *sarisa* at different dates that are given in the present Annex, it is assumed that the cubit (in terms of which the figures are given in the original Greek authorities) is the equivalent of eighteen inches. It is possible, however, that the cubit in which lengths were reckoned for this purpose may have been a 'short cubit' of some length between 18 inches and 12, and this suggestion is favoured by the fact that Arrian actually substitutes 'feet' for the 'cubits' of the other authorities. This would bring down the length of the *sarisa*, at its longest, to something very near the maximum length of the modern Western sixteenth-century and seventeenth-century pike. The traditional figures for the length of the *sarisa* at different dates are treated with extreme scepticism by Hogarth, D. G.: 'The Army of Alexander' in *The Journal of Philology*, vol. xvii (London & Cambridge 1888, Macmillan), pp. 3–5.

² Polyaeus: *Strategemata*, Book II, ch. 29, Anecdote 2.

³ Polybius, Book XVIII, ch. 29.

⁴ The evolution of the Macedonian phalanx is also discussed in IV. C (iii) (c) 2 (γ), pp. 433–9, above.

In the two-dimensional field we have already come across an example of pathological exaggeration in the correlation, that is brought out by an empirical survey, between geographical expansion and social disintegration.¹ In the three-dimensional field we also have examples ready to hand: the big buildings of the termites and the Egyptian Pyramid-Builders and the Ramsids and Constantine the Great and our own twentieth-century *Homo Occidentalis*;² the vast hulks of King Ptolemy IV's Egyptian quadragintareme and King George VI's British battleships; and the gigantic bodies of Goliath and the plesiosaurs.³

When we pass from sheer augmentation of size to an accentuation of characteristic features, the first example that is likely to come into our minds is the pathological distortion of the human body by the pinching in of waists and toes and the distension of lips and ears.⁴ Analogously, the decline of Jewry and of Athens advertised itself in a pathological insistence upon pushing to extremes the master-institution—in the one case the Mosaic Law and in the other case the Solonian Democracy—which was the supreme monument of the declining community's former faculty for creation.⁵ The Egyptian Mamlûks and the French *noblesse* were most vexatiously exacting in the levying of their feudal dues in an age when they had ceased to render any social services.⁶ And in the last generation of the *ancien régime* in England (*circa* A.D. 1800–32) there was a corresponding accentuation of the severity of the Game Laws in particular⁷ and of repressive penal legislation in general. The Papacy, again, procured the formal proclamation of its own infallibility by a council of the Roman Catholic Church at a moment in the nineteenth century of the Christian Era when the *ci-devant* master-institution of medieval Western Christendom was at the very nadir of its authority and prestige in the modern Western World.⁸ In our post-war England we may detect an inclination

⁶ 'Ceci amenait une sorte d'absentéisme de cœur, si je puis m'exprimer ainsi, plus fréquent encore et plus efficace que l'absentéisme proprement dit. De là vint que le gentilhomme résidant sur ses terres y montrait souvent les vues et les sentiments qu'aurait eus en son absence son intendant; comme celui-ci, il ne voyait plus dans les tenanciers que des débiteurs, et il exigeait d'eux à la rigueur tout ce qui lui revenait encore d'après la loi ou la coutume, ce qui rendait parfois la perception de ce qui restait des droits féodaux plus dure qu'au temps de la féodalité même.'—de Tocqueville, A.: *L'Ancien Régime et la Révolution*, seventh edition (Paris 1866, Lévy), pp. 180–1. Cf. pp. 44–7.

⁷ See Hammond, J. L. and Barbara: *The Village Labourer, 1760–1832* (London 1919, Longmans, Green), pp. 199–206.

⁸ The doctrine of Papal Infallibility was elevated to the status of a dogma by the Oecumenical Council which was held at the Vatican in 1869–70, on the eve of the collapse of the Papacy's temporal power. Even in the carefully tempered and guarded

to canonize, as the latter-day *Arcana Imperii Britannici*, the inveterate British practices of 'making no commitments' and 'muddling through'; and this self-contradictory impulse to elicit *a priori* principles out of empirical rules of thumb is more reminiscent of the ultramontane spirit of Pope Pius IX than of the insular English tradition. Finally, we may refer, by anticipation, to the phenomenon of 'Zealotism': a psychological state—as unmistakably pathological as it is unmistakably exaggerated—which is one of the two possible alternative reactions of the passive party in a collision between two civilizations.¹

This short excursion into the field of social pathology may perhaps serve to drive home the truth that every form of idolatry is intrinsically disastrous for the idolator.

formula in which it was expressed, the new dogma gave rise, at the time, to dissensions in the Council and to searchings of heart in the Church, as well as to widespread demonstrations of hostility in the Non-Catholic World. A psychologist might conjecture that in forcing the dogma through the Council Pope Pius IX was seeking 'compensation' on the plane of theology for the grievous losses that he was about to suffer on the plane of politics.

¹ For this phenomenon of 'Zealotism' see Part IX, below.

MILITARISM AND THE MILITARY VIRTUES

THAT 'Militarism' is suicidal—as we have tried to show empirically in the chapter to which this Annex attaches—is a proposition which will hardly be disputed by any one whose opinion carries weight; but, if this proposition is almost a truism, then it is unlikely to offer a solution of the moral problem that is presented by the institution of War; and, in fact, the word 'Militarism' in itself implies that this suicidal and iniquitous way of using military force is not the only way, but is rather a perversion—for which we have to coin a special name—of an institution which is not proved to be evil in its essence, *ipso facto*, by the admission that it lends itself to a monstrous abuse.

This morally non-committal attitude towards the institution of War in itself has been tacitly accepted in this Study up to a point. For example, in examining the stimulus of blows and the stimulus of pressures¹ we have drawn the majority of our illustrations from the domain of warfare, and have assumed that in this field of human activity, as in others that are less gruesome, the moral law inherent in Challenge-and-Response holds good. It is true that, on the other hand, we have also drawn two of our illustrations of arrested civilizations from communities which have been given over to the practice of War: the Spartans and the 'Osmanlis'.² But this only stamps us as neutrals. It does not place us in the camp of those who have declared a moral war on War as such. Is War intrinsically and irredeemably evil in itself? This is a question which cannot be shirked by any student of history or by any member of our Western Society in our generation, when it is the crucial question on which the destiny of our civilization hangs. The time has come when we must grapple with it; but, before we come to grips, we must make sure that we are taking account of all the difficulties.

The grand difficulty, of course, is the evident existence and importance of 'the military virtues'. These confront us as a monumental fact which cannot be whittled down or explained away. It is one of the commonplaces of popular sociological observation that the military peoples, castes, and classes are apt to win more admiration from us than their neighbours who earn their living by occupations which do not entail the risking of one's own life in the attempt to take some one else's. To English people in our day the

¹ In II. D (iv) and (v), in vol. ii, above.

² In Part III. A, in vol. iii, above.

classic example is the difference which we observe between the diverse peoples and castes of India. We admire the Gurkhas more than the Kashmiris, and the Rājputs more than the Bengalis; and this is not just a prejudice which can be accounted for by our peculiar relation to our Indian fellow subjects; for, by the same token, we admire Colonel Newcome more than Jos. Sedley. There is, indeed, an old-fashioned type of English military or naval officer—nice in his sense of honour, considerate to his fellow human beings, and kind to animals (though he enjoys killing them for sport!)—who has been regarded, for at least two centuries past, as one of the finest English products of our Western Christian Civilization. Nor can this admiration be dismissed with contempt as being naïve or snobbish. If we look into it seriously and with no *parti pris*, we shall assuredly be confirmed in our belief that it is deserved. For ‘the military virtues’ are not in a class apart; they are virtues which are virtues in every walk of life. Courage, which is the most prominent of them, is a cardinal virtue in every action to which a human being can set his hand—or hers; and the other virtues which we have ascribed to our legendary colonel or commodore are also patently legal tender in civil as well as in military life. Colonel Newcome and the Chevalier Bayard; Cœur-de-Lion and Roland; Olaf Tryggvason and Siegfried; Regulus and Leonidas; Partāp Singh and Prithirāj; Jalāl-ad-Dīn Mankobirni and ‘Abdallah al-Battāl; Yoshitsune Minamoto and Kuang Yü: what a goodly company they are, and how large a place they fill in the historical landscape of these last five or six thousand years within which Mankind has embarked upon the enterprise of Civilization!

What are we to make of the vein in our social tradition which till yesterday was still inspiring heroes such as these and which to-day still moves the rest of us to admire them? If we wish to understand either the value of ‘the military virtues’ or the sincerity of the admiration which they win, we must take care to look at them in their native social setting; and one feature of this which is pertinent to our present inquiry leaps readily to the eye. ‘The military virtues’ are cultivated and admired in a milieu in which social forces are not sharply distinguished in people’s minds from the non-human natural forces, and in which it is at the same time taken for granted that natural forces are not amenable to human control.

‘Down to modern times, War was almost universally regarded as something which in itself required no justification. Its drawbacks and horrors were, indeed, recognised, but at worst it was considered an inevitable evil, a calamity, a scourge sent by God, of the same unavoidable

nature as the plague.¹ To a community threatened by Vikings, or other aggressive neighbours, this was the obvious way to regard it. From the victim's point of view there *was* no distinction in principle between the sudden incursions of such people and those of a horde of locusts or a cloud of disease germs. But this made it all the more natural to admire and honour the prowess of an Alfred or a Charlemagne, who could protect his people from disaster in such circumstances. Down to modern times, though the justification for a particular war might be questioned, and its hardship realized, fighting was all in the day's work, an incident of human existence the abolition of which was hardly an imaginable possibility. In these circumstances, while few may have praised war, everyone valued the warrior, and submitted willingly to his leadership and control. Down to the nineteenth century the army was regarded as almost the only profession open to a gentleman, and a gentleman is "armiger".²

The gentleman and scholar who has communicated these observations to the writer of this Study goes on, in the course of the same letter, to make an illuminating comparison between War and 'Sport'.

'In prehistoric times, before the domestication of animals, the hunter discharged a very necessary function in providing food. Surrounded by raiding barbarians, the soldier equally served to make life more tolerable and justice more capable of attainment. The finest men attached themselves to these pursuits, and their achievements were rightly honoured, and the same type of man tends to inherit their instincts with their qualities. This is why we prefer Colonel Newcomes to Jos. Sedleys. But their functions have become less necessary; in the case of the hunter, perhaps, entirely useless.'

The comparison is illuminating because, in the case of hunting, we see a pursuit which, at a primitive level of life, has been socially valuable and even vitally necessary becoming unquestionably superfluous at an early, and a frequently attained, stage of economic advance. At this stage the practice of hunting for a livelihood becomes transformed, perhaps usually by a gradual process of change, into an economically otiose 'sport'. On this analogy, can we posit a stage of social progress at which the practice of War in sheer self-defence against uncontrollable hostile forces becomes comparably transformed into a socially otiose 'Militarism'? On this analogy the sinister 'Militarism' which we can distinguish empirically from the innocent prowess of the happy warrior might perhaps be defined as a practice of War for War's sake when the

¹ 'Choose thee either three years' famine; or three months to be destroyed before thy foes, while that the sword of thine enemies overtaketh thee; or else three days the sword of the Lord, even the pestilence' (1 Chron. xxi. 11-12; cf. 2 Samuel xxiv. 12-13).

² Mr. G. M. Gathorne-Hardy in a letter to the present writer.

institution has ceased both to be, and to be regarded as being, a social necessity.

In our Western World in the so-called 'modern' chapter of its history we have seen War placed on the same shelf as hunting during an eighteenth-century 'lull' when War was only in vogue as 'the sport of kings'.¹ The bad name of 'militarist', which glances off the armour of a Cœur-de-Lion or a Bayard, is a Devil's cockade which sticks fast in the *tricorn* of a Charles XII or a Frederick the Great. The kings who took their sport on the Western battle-fields of that age were 'militarists' beyond question. Yet, in the light of our later experience, it has to be said in their favour that Frederick and his kind were not the most pernicious exponents of 'Militarism' that were to afflict our modern Western Society. Frederick, for example, would never have dreamed of glorifying War as it has been glorified in a classic passage from the pen of a later Prussian militarist, Hellmuth von Moltke.

'Perpetual Peace is a dream—and not even a beautiful dream—and War is an integral part (*ein Glied*) of God's ordering of the Universe (*Weltordnung*). In War, Man's noblest virtues come into play (*entfalten sich*): courage and renunciation, fidelity to duty and a readiness for sacrifice that does not stop short of offering up Life itself. Without War the World would become swamped in materialism.'²

In this extravagant eulogy of War there is a note of passion, of anxiety and of rancour which is a far cry from the urbane and philosophic scepticism of a Frederick the Great. So profound a change of tone is presumably the echo of comparably profound changes of temper and circumstance which had come over the Western World within the period of less than a hundred years that had elapsed between Frederick's death in A.D. 1786 and the year in which von Moltke wrote this letter to Bluntschli. We can observe two such changes which are of this magnitude.

By the time when our nineteenth-century Prussian militarist was an old man, the eighteenth-century cultivation of War as 'the sport of kings' had, in fact, evoked two reactions which were not only distinct but were antithetical. Both reactions proceeded from the common postulate that to fight for fun was shocking; but, while

¹ For War as 'the sport of kings' see IV. C (iii) (b) 3, pp. 143-9, above. For the 'lull' in the eighteenth century see V. C (ii) (b), vol. vi, pp. 315-16, below. The intimacy of the association between the two forms of 'Sport' with which our eighteenth-century Western kings amused themselves is commemorated in the name *chasseurs* or *Jäger* which is still borne by a number of regiments in the historic Continental European armies. The name is a reminder of the fact that, in the eighteenth century, the same footmen were employed as huntsmen and as soldiers, turn and turn about, to suit the convenience or the caprice of their royal masters.

² Letter, dated the 11th December, 1880, from Hellmuth von Moltke to Johann Kaspar Bluntschli, published in Bluntschli's *Gesammelte Kleine Schriften* (Nördlingen 1879-81, Beck, 2 vols.), vol. ii, p. 271.

one school of reformers took the line that an evil which had been turned into a sport both could and should be abolished altogether,¹ the other took the line that the evil could not be borne if it were not to be endured for a serious purpose. Thus, when the royal sportsmanship of the eighteenth century fell into a unanimous discredit, the nineteenth-century 'pacifists' found themselves confronted by a nineteenth-century brood of 'militarists' of von Moltke's type who were far more formidable than their frivolous eighteenth-century predecessors.

This quarrel over the reform of an eighteenth-century abuse between two opposing parties of nineteenth-century 'progressives' perhaps accounts for von Moltke's tone in the passage that we have quoted. In this *extravaganza* he is bidding defiance to contemporary 'pacifists'.

'It is when an institution no longer appears necessary, that fantastic reasons are sought or invented for satisfying the instinctive prejudice in its favour, which its long persistence has created. It is just the same with the sport of the hunter; you will find its most elaborate defence in very recent literature, precisely because what is now challenged was at an earlier period taken for granted.'²

In this contest between the 'pacifist' who seeks to abolish 'the sport of kings' and the 'militarist' who seeks to re-convert it into a serious business of the peoples, what are the omens to-day? We can hardly forbear to ask a question which may be the riddle of our Society's destiny; but the omens, as far as we can read them, are not at present reassuring. In our own day we see von Moltke's provocative thesis being adopted as one of the fundamental articles of their creed by the prophets of Fascism³ and National-Socialism, and being accepted with enthusiasm by the masses whom these prophets have succeeded in converting to their faith. This so-called 'heroic' attitude towards life is being welcomed with open arms, and taken in deadly earnest, at this moment by millions of young men, and the reason why it appeals to them is manifest. They are greedy for the virtues in the form of 'the military virtues' because they have been starved of other kinds of spiritual bread, like the Prodigal Son who, when starved of human food, 'would

¹ For the tardiness of the development of this movement for the abolition of War see IV. C (iii) (b) 3, pp. 152-3, above.

² Mr. G. M. Gathorne-Hardy, in the letter quoted above.

³ 'We are becoming—and shall become so increasingly, because this is our desire—a military nation. A militaristic nation, I will add, since we are not afraid of words. To complete this picture: warlike—that is to say, endowed ever to a higher degree with the virtues of obedience, sacrifice, and dedication to country' (Signor Mussolini, in a speech delivered on the 24th August, 1934, at the close of the Italian army manoeuvres of that summer). 'War alone brings all human energies to their highest tension and sets a seal of nobility on the peoples who have the virtue to face it' (Mussolini: 'The Doctrine of Fascism' in the *Enciclopedia Italiana*, vol. xiv, no date [circa 1934]).

fain have filled his belly with the husks that the swine did eat'.¹ Moreover we know what these prodigals' spiritual sustenance used to be, and when their starvation began. These latter-day Western worshippers of 'the military virtues' are the epigoni of generations which were nurtured in 'the Christian virtues'; and they began to be starved of the traditional Christian morality, upon which their forebears had been brought up, when, at the turn of the eighteenth and nineteenth centuries, the unbelief of a cultivated minority in the Western World began to infect the less sophisticated masses.

The truth is that the spirit of Man abhors a spiritual vacuum; and, if a human being, or a human society, has the tragic misfortune to lose a sublime inspiration by which it has once been possessed, then, sooner or later, it will seize upon any other spiritual food that it can find—however coarse and unsatisfying this new fodder may be—rather than remain without any spiritual sustenance at all. In the light of this truth the recent spiritual history of our Western Society can be told—and the glorification of War can be explained—as follows: Owing to the breakdown of the Hildebrandine Papacy, which was the master-institution of our medieval Western Christendom, our Western *Plebs Christiana* received such a grievous moral shock that the Christian way of life, in which our forebears had been brought up, very largely lost its hold upon us;² and, finding ourselves, at the end of a series of calamities and disillusionments, with our house swept and garnished³ by an intellectual *Aufklärung*, but untenanted by the Christian spirit that had formerly dwelt in it,⁴ we cast about for other tenants to fill an agonizing spiritual void. In this search we addressed ourselves to the alternatives that lay nearest to our hand. Our Western culture had three sources—namely, the internal proletariat and the external proletariat and the dominant minority of the Hellenic Society to which our Western Society was 'affiliated'⁵—and when Christianity, which was the religious legacy of the Hellenic internal proletariat, appeared to fail us we turned hungrily to the religions of the Hellenic external proletariat and the Hellenic dominant minority. As it happened, these two religions were virtually the same; they were, both of them, variants of the primitive idolatrous worship of the tribe or state;⁶ and therefore the

¹ Luke xv. 16.

² On this point see IV. C (iii) (c) 3 (β), pp. 580–1, above.

³ Matt. xii. 44 = Luke xi. 25.

⁴ See V. C (i) (d) 6 (δ), Annex, vol. v, pp. 669–72, below.

⁵ See I. C (i) (a), vol. i, pp. 52–62, above.

⁶ It is strange that the creators of the Hellenic Civilization should have remained on the same religious level as the Teutonic barbarians in the no-man's-land beyond the northern frontiers of the Roman Empire; but we have seen (in I. C (i) (b), vol. i, pp. 95–100, above) that the Hellenes derived their religion, not from the Minoans who had created the culture to which Hellenism was 'affiliated', but from the Achæan barbarians who had eventually overrun a derelict Minoan World; and we have also seen (in II. D

modern Western apostate from Christianity, in his search after a new god, found the same idol awaiting his adoration in whichever of the two alternative directions he cast his eyes. Machiavelli consulting his Livy and Rousseau his Plutarch and De Gobineau his Sturlason and Hitler his Wagner were each led, by his respective literary or musical oracle, to the altar-steps of the same Abomination of Desolation: the Totalitarian Parochial State. In this pagan worship of the parochial community—be it Hellenic or Gothic or Scandinavian in its inspiration—the cult of ‘the military virtues’ is an obligatory practice, and the glorification of War a fundamental article of faith. And we can now understand why von Moltke exclaims, with a passion which is assuredly sincere, that ‘Perpetual Peace is not even a beautiful dream,’ and why he deprecates the abolition of War in a fear, which is manifestly genuine, lest the realization of the ‘pacifist’s’ dream may simply plunge our neo-pagan world back again into a spiritual vacuum.

In fact, we may be driven to admit that von Moltke is right in taking this stand if he is right in his underlying assumption that modern Western Man is confined to a choice between two, and only two, alternatives. If we have really lost the power or the will to practise the virtues of Gethsemane, then it is certainly better to practise those of Sparta or Valhalla than to practise none at all. And in a *ci-devant*¹ Christian society this conclusion is no longer academic; for, in turning our conditional clause into the simple indicative, von Moltke is now being followed by the masses; and his disciples in our generation can claim, without fear of contradiction, that they have the big battalions on their side. The latter-day Western cult of ‘the military virtues’ as the Ten Commandments of a Totalitarian Parochial State is fast becoming the prevalent religion of the age; and this faith, archaistically² barbaric though it be, will never be overcome by the Mephistophelian spirit of sheer negation³ against which it is itself a victorious protest. Societies are apt to get the religions, as well as the governments, that they deserve; and, if we have become unworthy of our Christian birthright, then we have condemned ourselves to worship the resuscitated ghost of an Odin or an Ares. This barbaric faith is better than none at all; in the deaths of a Leonidas and an Olaf Tryggvason the heroism which ‘Militarism’ inculcates has risen to

(vii), vol. ii, pp. 315–22, and in II. D (vii), Annex V, vol. ii, pp. 434–7, above) that these Achaean barbarians were the cultural kinsfolk of the Teuton barbarians who overran a derelict Hellenic World some eighteen centuries later.

¹ See I. B (iii), vol. i, p. 39, above.

² The expedient of Archaism, which is one of several alternative attempts to find a satisfactory response to the challenge of social disintegration, is examined in IV. C (i) (d) 8, vol. vi, pp. 49–97, below.

³ ‘Ich bin der Geist, der stets verneint!’—*Faust*, I. 1338, quoted already in II. C (ii) (b) 1, vol. i, p. 277, above.

the height of sublimity; but this is not the sublimity of the saints, and not a heroism which leads anywhere except to suicide. Witness the fates of the abortive Scandinavian Civilization and the arrested Spartan Civilization, which we have surveyed elsewhere.¹ And such will likewise be the fate of our Western Civilization if von Moltke is right in his underlying assumption of fact, as well as in his moral deduction from it. It remains to be seen whether this assumption is correct, or whether on the other hand Christianity, so far from being out of the running, has still the power to release the soul of *Homo Occidentalis* from the grip of a hideous and destructive paganism by offering him, once more, a higher positive alternative. Can Hildebrand arise again in his might to heal the wounds inflicted upon the souls of his flock by the sins of a Rodrigo Borgia and a Sinibaldo Fieschi?² This is the greatest of all the questions that have to be answered in our Western World in this twentieth century.

In following the clue that has been given us by von Moltke, and examining the hold which the worship of 'the military virtues' has been reacquiring over our Western souls in these latter days, we may find that we have made some progress towards solving our problem of whether the institution of War is intrinsically and irredeemably evil in itself. We have discovered, in effect, that the problem has been wrongly propounded. Perhaps the truth is that no created thing can ever be evil intrinsically and irredeemably, because no created thing is incapable of serving as a vehicle for the virtues that flow from the Creator. 'The military virtues' are virtues none the less for being jewels set in blood and iron; but the value lies in the jewels themselves and not in their horrible setting; and it is flying in the face of all experience to jump to the conclusion that the only place where we can ever hope to find these precious things is the slaughterhouse where they have happened to make their first epiphany to human eyes. The diamond that is secreted in the clay does not remain there, but finds a fitter setting in the crown of a king; and when once the diamond-mine has yielded up its treasure it ceases to be anything but a death-trap for the miner who cannot now tear himself away from the scene of his habitual toil and his accidental trove. What is true of the dross in which the diamond has lain buried is likewise true of the ephemeral institution of War in which an eternal principle of goodness has glimmered darkly for a season, in the guise of 'the military virtues', in order that it may shine out brightly hereafter in the perfect physical peace of the City of God. It is the divine

² See IV. C (iii) (c) 3 (β), pp. 583-4, above.

virtue—unchanging in itself, but always changing its temporal abode—that casts the reflexion of its own inner light upon each of its successive dwelling-places; and each of these dwelling-places assumes a derelict ugliness as soon as the temporarily indwelling spirit has ceased to lighten its darkness.

'There is hardly any occurrence or phenomenon about which we need always be of the same mind if we trace it back through the ages. That is, no evil was originally an evil, but only became so. . . . Many . . . instances of things originally good, but which have outlived their purpose, could be quoted; and among them perhaps we might include War. Like everything which has life, War never remains stationary, but is always developing. Animals did not wage war, but human beings did, and our descendants—the "supermen", as Goethe and Nietzsche call them—will cease to do so. . . . The [institution of] War, with which history has acquainted us, was once born; it was young and now is old. But, just as the love of a maid seems to us lovely and that of an old woman repulsive, even so it is with War: we cannot and must not judge alike two things which from their very nature and meaning are wholly different. There is nothing whatever in common between Achilles' eternal Song of Hate and Lissauer's Hymn of Hate to England; and similarly there is the profoundest difference between the battles in the Scamander Valley and the fighting between the Meuse and the Moselle.'¹

If we have persisted in the worship of War when the goodness which once found a genuine though inadequate expression in 'the military virtues' has been given an incomparably higher sphere for its exercise in the Christian life, then we have been guilty of that idolization of an ephemeral institution which is one form of the nemesis of creativity.² And our sin is aggravated if, after centuries spent in attempting the impossible feat of serving two masters, we have latterly held to the lower and despised the higher³—relapsing altogether into the service of Odin and Ares, and repudiating even that half-hearted service which was rendered to Christ by our forebears. This last state of paganism is vastly worse than the first;⁴ for the deliberate and self-conscious perversity of von Moltke's and Mussolini's archaistic 'Militarism' is as different from the innocently archaic 'military virtues' of the Chevalier Bayard and Colonel Newcome as the dusk of evening is different from the gleam of dawn. The innocence which the Colonel inherited from the Chevalier can never be recaptured in our Western World by the heirs of Frederick's and Napoleon's cynicism. Colonel Newcome's own author was well aware, when he created this lovable character in the middle of the nineteenth century, that his creature's charm

¹ Nicolai, G. F.: *The Biology of War*, English translation (London 1919, Dent), pp. 420-1.

² See IV. C (iii) (c) 2 (β), pp. 303-423, above.

³ Matt. vi. 24 = Luke xvi. 13.

⁴ Matt. xii. 45 = Luke xi. 26.

and tragedy both owed something to the fact of his being already an anachronism. The devotees of a Mussolinian Mars Redivivus will not be Newcomes or Bayards; they will be Robots and Martians. This process of perversion, which is the Dead Sea fruit of an Idolatry mated with Archaism, is the exact reverse of that process of 'etherialization', and that progressive transference of the field of action from the Macrocosm to the Microcosm, in which, at an earlier point in this Study, we have discovered our criterion of growth.¹ If this criterion is the true one, it informs us *a priori* that the institution of War cannot be morally static. Granting that this gruesome institution has provided a field for the exercise of 'the military virtues' yesterday, we may be sure that to-morrow the 'chivalrous' kind of War will either rankle into a 'Militarism' without a vestige of virtue or beauty or else will be transfigured into a *militia Christi* in which the physical warfare of one man against another will have been translated into a spiritual warfare of all men united in the service of God against the powers of evil.

If our present apostasy proves only to be the last convulsion of a paganism *in articulo mortis*, and if this supreme crisis in the long-drawn-out struggle between paganism and Christianity is to end in paganism being driven completely off the field, we may dream of an age to come in which Physical War will have passed out of our life and faded out of our memory until the very word 'war' loses currency—as the kindred word 'sacrifice' has lost it already—except in a meaning which was originally a metaphor. In those days, when men speak of 'war', they will be referring to the war of the spirit; and if they are ever reminded of the physical warfare which was the constant scourge of their predecessors for some six or seven thousand years, they will think of it in the category of one of those cruel initiation rites to which *Homo Catechumenus* used to submit himself in order to win his way at last into a Communion of Saints in which the theatre of War has been transferred from an outward to an inward battlefield. The warfare of that perfect *Respublica Christiana* has been depicted with a poetic wealth of military imagery,² and has been described with the prophetic vision of sainthood,³ by one of its citizens who came to proclaim the advent of the *Civitas Dei* many hundreds or thousands of years in advance. Saint Paul was delivering his message to the citizens of the war-stricken cities of a Hellenic universal state in an age of Hellenic history when the gleam of 'the military virtues' could still catch and captivate the eye from beneath the tarnish deposited by the 'Militarism' of a 'Time of Troubles'; and the Apostle seizes

¹ See III. C (i) (c) and (d), vol. iii, pp. 174-217, above.

³ 2 Cor. x. 3-5.

upon all the noble and glorious connotations of War that still survive in his converts' minds in order to convey to them, in a chain of military metaphors, the more etherial glory and nobility of the Christian life.

"Though we walk in the flesh, we do not war after the flesh (for the weapons of our warfare are not carnal, but mighty through God to the pulling down of strong holds): casting down imaginations, and every high thing that exalteth itself against the knowledge of God, and bringing into captivity every thought to the obedience of Christ."¹

Additional Note

Perhaps the considerations set out above may partially meet the following criticism of an earlier part of this Study which the author has received from Mr. G. F. Hudson of All Souls College, Oxford:

"What troubled me in my reading of the chapters on "Challenge-and-Response" was the fear that too much emphasis on the role of hard conditions in producing Civilization may work in favour of the "heroic" Nazi idea, which I am sure is the last thing you would wish! The advocates of unrestricted economic competition and of *Machtpolitik* have always urged that their kind of world makes for progress and high achievement, while a humanitarian social and international order would lead to stagnation and futility. It seems to me essential to distinguish between the *value* of different kinds of responses and to differentiate a type of challenge presented by power and wealth from that presented by hardship and oppression. Challenges of the latter kind bring responses that are primarily economic and military, and along with great achievement in these fields goes an outlook which tends to be harsh, brutal and "uncivilized" by the finer standards of Civilization (cf. in various ways

¹ The following comment on this passage from the Second Epistle of Saint Paul to the Corinthians has been communicated to the writer of this Study by Mr. G. M. Gathorne-Hardy:

"Saint Paul's great picture of the Christian in Ephesians is rendered attractive by being dressed in all the panoply of War; and herein, to my mind, lies the true significance of the passage of 2 Corinthians which you quote at the end of this section. The stress is by no means on the renunciation of fleshly warfare, but on the substitution of something more terribly effective. This is how it runs in Moffatt's translation:

"My mind is made up to tackle certain people who have made up their minds that I move on the low level of the flesh. I do live in the flesh, but I do not make war *as the flesh does*; the weapons of my warfare are not weapons of the flesh, but divinely strong to demolish fortresses—I demolish theories and any rampart thrown up to resist the knowledge of God, I take every project prisoner to make it obey Christ, I am prepared to court-martial any one who remains insubordinate, once your submission is complete."

"The striking thing here is the sustained use of a military metaphor, as calculated to appeal to man's noblest instincts. Had St. Paul shared the views of the modern "pacifist" with regard to war, or had his hearers done so, the metaphor would sound absurd. It is easy to test this. "The poison with which I seek my ends is not carnal", or "I do not use an earthly 'jemmy' to crack the heavenly crib!" The meaning would be the same, but the argument would lose its appeal. No, St. Paul's constant use of military metaphor signifies that in his day warfare was regarded as a noble and glorious occupation."

At the same time this use of military metaphor in the Epistles of Saint Paul is the first step—and a long step—towards a transfiguration of the word 'War' from a physical to a spiritual meaning.

Rome, Prussia and the North British, Yankee Puritan, Industrial response). But success in the economic and military responses inevitably brings wealth and power: i.e. it eliminates the conditions which gave rise to the civilization; and the challenge now to be met is that of success itself. If such success must bring degeneration, the only remedy is to retain the adverse conditions, or some discipline equivalent to them, artificially. But this introduces a contradiction into human effort, for every response to a challenge is a genuine effort to overcome that challenge. The response to the challenge of the American wilderness was Chicago, but the success of the response eliminates the wilderness. Thus the problems of modern America are of quite a different kind from those of the Frontier Age, and the idea of some Americans (expressed in a film *The World Changes*, which you may have seen) that Industrialism has been all a mistake, and that America can only save her soul by getting back to subsistence-farming, is in fact a counsel of despair, for logically it implies that all Man's effort to conquer Nature and increase wealth is self-defeating. The answer, however, appears to be given by the histories of two places which you quote as examples—Athens and Venice. In both cases a community not favoured by Nature compensates itself and grows great by trade. But in both cases it is only *after* the economic problems have been solved, and the hardships of living on the "thin soil of Attica" or the Lido mudflats have long been forgotten, that the cities make their great contributions to Civilization in the higher sense. Athens and Venice were "sitting on the top of the World" and no longer grappling with "hard countries" when they produced Sophocles and Plato, Giorgione and Titian. It is, I contend, harder to live well in Capua than to cross the Alps; and to suggest that Capua represents the absence of challenge, and emphasize material hardship as a spur to creation, is to weigh down the scales against the finer intellectual and aesthetic and "Epicurean" development of Civilization in favour of Spartans, Puritans, "strong men", "go-getters", "militarists", Cato and Herr von Papen (who have quite enough of the game already!).'

ANNEX TO IV. C (iii) (c) 3 (β)

INNOCENT III'S RESPONSE TO THE CHALLENGE OF CATHARISM

At two points in this Part of the present Study¹ we have touched upon the connexion between Pope Innocent III's proclamation of a martial crusade against the Albigensian Cathars and his approval of the spiritual movements that were being initiated in Western Christendom at the time by Saints Dominic and Francis. Innocent's approval of the spiritual revival within the bosom of the Church was as lukewarm as his recourse to the sword against the heretics was half-hearted; and this lukewarmness in a good cause will perhaps more than offset the half-heartedness in a bad cause when we are appraising Lotario de' Conti's spiritual worth as a human being. If, however, we mercifully allow that great Pope the easier option of being judged, not as a man, but merely as a statesman, we shall find evidence of statesmanship of an exceedingly high order in the dual policy which Innocent worked out and applied as his solution for the problem of Catharism. The nature of this policy has been clarified in an illuminating work from the pen of a modern Western scholar.²

The problem of Catharism was even graver than that of the relations between the Spiritual and the Temporal Power which confronted the Western Church in the same age. The two problems had both presented themselves in the course of the eleventh century, and their common root was the corruption of the Western Church in general, and the Papacy in particular, in the immediately preceding period of Western history.³ This scandal provoked the simultaneous attacks which the Western Church sustained at the hands of the heretics and of the secular powers respectively. Both attacks were formidable, but the heretics' onslaught was the more dangerous of the two because it had a longer reach. While the secular powers did not look beyond one or other of the alternative aims of exploiting the Church or reforming it, the Cathars threatened to destroy it by proclaiming principles which shook the Church's existing structure to the foundations.

The crucial issue between these converts to an Oriental heresy and the authorities of a Western Church against which they were

¹ In IV. C (iii) (c) 2 (β), pp. 369-71, and IV. C (iii) (c) 3 (β), pp. 558-60 and 562, above.

² Grundmann, H.: *Religiöse Bewegungen im Mittelalter* (Berlin 1935, Ebering).

³ For this corruption see IV. C (iii) (c) 2 (β), pp. 370-1, and IV. C (iii) (c) 3 (β), pp. 521-3 and 551-2, above.

in revolt was not the Christological dispute between a Paulician 'Adoptionism' and an Orthodox 'Conceptionism'.¹ Still less was it the more general theological issue between a Manichaean dualism which was attributed to the heretics by the Catholics *a priori*² and a monism which the Catholics professed in theory without always managing to avoid the pitfall of dualism in their own theological speculations when they were off their guard. The principles over which the medieval Western battle between orthodoxy and heresy was fought were not matters of theology at all, but were matters of practical life.

'The notion of Christian poverty and of living the Apostolic life of the itinerant preacher is the essential content of the heresy [which made its appearance in Western Christendom in the eleventh century]. This is so at Cologne as well as in the South of France; and this notion always continued in fact to be the principal *motif* of the heresy, among Cathars and Waldensians alike, down to the beginning of the thirteenth century. To lead the life of the Apostles and to be their true successors is the gist of the heretics' claim; and it was this claim that brought about their breach with the Church. . . . [Theological] speculations retire quite into the background in face of what was really the principal question—the question whether the true Church of Christ is to be found among those who claim for themselves the Apostolic Succession and, with it, the exclusive and effective authority to confer all ecclesiastical orders, or whether, on the contrary, it is to be found among those who live as the Apostles lived and as the Gospel demands.'³

These two evangelical ideals of the Apostolic life and a voluntary poverty made a powerful appeal to the *Plebs Christiana* of the Western World in the second chapter of Western history: in the first place because at this time and place these ideals had the charm of novelty;⁴ in the second place because they shone out so dazzlingly against the dark foil of current conduct in the life of the Established Church; and in the third place because the advocates of this new evangelicalism were impressive practisers of what they were preaching. The Cathars were not disgruntled proletarians⁵ who, under a show of piety, were seeking—even if only half-consciously—to reduce their more prosperous neighbours to a level of poverty above which they themselves had no hope of rising. Catharism was not a protest against the experience of poverty; it was a revulsion from the experience of wealth.⁶ Waldes, for

¹ For the distinction between an 'Adoptionist' and a 'Conceptionist' version of Christianity see IV. C (iii) (c) 2 (β), Annex III, above, and V. C (ii) (a), in vol. vi, pp. 267–75, below.

² See the passage quoted from Grundmann in IV. C (iii) (c) 2 (β), Annex III, p. 628, footnote 8 (on p. 629), above.

³ Grundmann, *op. cit.*, pp. 21 and 25–6.

⁴ *Ibid.*, p. 15.

⁵ *Ibid.*, pp. 29 and 157.

⁶ *Ibid.*, pp. 58–9, 168–9, and 194–5.

example, the eponymous founder of the Waldenses, was a rich man who had made his fortune by usury.¹ And, while some of the heretics were uneducated (*rusticani*),² the cultivated and well-to-do element predominated.³ Clerics and nobles, but never proletarians, are expressly mentioned as joining their ranks, and the legal profession was well represented among them.⁴ It was the self-imposed rules of these religious communities, and not any involuntary circumstances in the previous state of life of their members, that debarred them from retaining wealth and from accumulating it;⁵ and, if their preachers acquired the name of weavers, this was because they were preachers-turned-weavers (on the model of Saint Paul), not weavers-turned-preachers.⁶

When the rich and noble thus embraced an evangelical poverty for Christ's sake, this was a sure sign of the genuineness of their religious conviction.⁷ The potency of their preaching was proportionate to the degree of their own personal sacrifice. This was a movement which the medieval Western Established Church could not afford either to flout or to ignore. Yet the first reaction of the Church to Catharism was aridly negative. When the ecclesiastical authorities found that they could not snuff Catharism out by giving it the bad name of Manichaeism, they denounced the Cathars on the better substantiated grounds that they were setting up a Counter-Church and that their programme of going back to the Gospels involved the abandonment of a number of vital Catholic institutions.⁸ Even when the authorities did not set themselves to suppress the heresy by force, they refused the heretics permission to put their evangelical ideals into practice. For instance, when in A.D. 1179 the Waldenses petitioned the Roman Curia for licence to live their Apostolic life, they were refused the right to preach after being put through a mere travesty of an examination.⁹ Such levity and lack of vision in high places, of course, merely confirmed, instead of refuting, the heretics' indictment of the Church, and accelerated the progress of the heresy instead of retarding it.

This was the state of affairs as Innocent III found it on his accession; and the policy that he devised for dealing with it is his chief title to be regarded as a great pontiff.

'The decisive turn in the relations between the hierarchical Church and the religious movement was taken during the pontificate of Innocent III. Until then the religious movement had grown, through its own native forces, outside the Church and in increasing opposition to it—

while the Curia had neglected (apart from the relatively trivial attempts at the beginning of the twelfth century) to look for ways of creating a field of activity inside the Church for the new forms of religious life: voluntary poverty and itinerant preaching. All efforts to secure ecclesiastical recognition for these forms of life had been answered by the Church with a veto and with an instruction that any transgression of this veto was to be punished as heresy. But at the same time the Church lacked both the means and the energy to enforce this veto in practice and to suppress the religious movement effectively.

This was the strained situation which Innocent III found when he mounted the Papal Throne at the beginning of 1198. In this situation he did not immediately intervene with a definite comprehensive programme; and in fact he never attempted to transform the situation on uniform and radical lines by taking systematic creative measures. On the other hand, from the beginning of his pontificate until his death, in all the measures which the Curia felt itself obliged to take *vis-à-vis* the religious movement and the heresy, Innocent steadfastly and unwaveringly maintained a position, and pursued aims, which betokened a fundamental departure from the policy of his predecessors. He sought to bridge the gulf between the religious movement and the hierarchical Church by conceding to the demands for Apostolic itinerant preaching and for evangelical poverty a possibility of finding scope for action inside the Church—but this only on condition that the orthodox doctrine was not tampered with and that the Papal and hierarchical authority received an unqualified recognition. By this policy he compelled the devotees of the evangelical life, voluntary poverty and Apostolic preaching to make the choice between the Church and heresy—without maintaining the previous ruling that allegiance to the Roman Church should imply a renunciation of the ideals of the religious movement. On the other side he showed an uncompromising severity, and brought into action all the forces and the means at his command, in combating heresy in so far as it refused to accept, in consideration of these concessions, its own reincorporation into the ecclesiastical order. And finally he enlisted for this struggle against heresy precisely those circles which shared with the heretics their participation in the religious movement but which had duly consented to be incorporated into the society of the Catholic Church. This policy resulted on the one hand in the formation of a series of communities, congregations and orders (the mendicant orders, above all) in which the movement for religious poverty found its ecclesiastically recognized orthodox expressions, while on the other hand it produced the new ways of combating heresy: the Albigensian War and later the Inquisition. This does not mean that Innocent either created or even willed these new structures and new methods. The living forces that led to them had not proceeded from him, and he had no part or lot in them. His policy was not the expression of a religious conversion of the governing element in the Church; it sprang from a clear insight into the Church's tasks *vis-à-vis* the religious movement of the age—a movement that could never be mastered by mere vetos and condemnations

without any constructive work on the Church's part. Innocent III did not experience in himself the religious forces of his time, but he did recognize their existence; and he has to his credit the important achievement of having known how to incorporate these forces into the hierarchical Church and having exercised the cleverness and the tact, the foresight and the energy, that were requisite for this task. Thereby he not only averted the danger that the hierarchical Church might irretrievably cut itself off from the living religious forces of that age; he also smoothed the path and pointed the way for the reformation of the Christian life in the Catholic Church of the thirteenth century. His policy decided that the formless fermentation of the religious movement should succeed in bringing forth the great new orders and ordinances.¹

If Innocent had not adopted this policy in his Roman Curia, Francis in his Umbrian city-state might have been driven out of the Church's fold into the Cathars' wilderness. Both Francis himself and Bernard of Quintavalle came from just the same social milieu as Waldes;² the first generation of Franciscans, like their Cathar contemporaries, were mainly drawn from the well-to-do bourgeoisie and the nobility and the clergy;³ and they were mistaken for heretics on their first appearance in France.⁴ This affinity between Franciscanism and Catharism in respect of their common virtue of unworldliness enabled the spirit of Saint Francis to prevail over the spirit of Waldes and Bogomil-Theophilus and Constantine-Silvanus and Paul of Samosata when the Western Church had signally failed to quell this alien spirit by calumny and obstructiveness and violence. And on this showing we must conclude that, while Francis might never have been given the scope for doing his work within the bosom of the Church if it had not been for Innocent, it is equally improbable that Innocent's dual policy would have been blessed with success if it had not been for Saint Francis and Saint Dominic. If this is our conclusion, we shall be more than ever at a loss to understand the apparent superciliousness of Innocent's bearing towards Francis at his first encounter with this heaven-sent executant of the worldly will of a hard-pressed ecclesiastical statesman.

V

THE DISINTEGRATIONS OF CIVILIZATIONS

A. THE PROBLEM OF THE DISINTEGRATIONS OF CIVILIZATIONS

IN passing from the breakdowns of civilizations to their disintegrations we have once more to run the gauntlet of a question which has already confronted us, at an earlier point in this Study, when we were passing from the geneses of civilizations to their growths.¹ At that point we found ourselves constrained to pause in order to consider whether we were setting ourselves a genuine problem. If we had previously probed as far as we were able to probe into the geneses of civilizations, had we not thereby already won the right to take their growths for granted, on the assumption that growth must follow birth as automatically and as inevitably as day follows dawn? Now that, in the later part of our Study at which we have since arrived, we have again reached our Pillars of Hercules in probing, this time, into the problem of breakdowns, can we not be content to dismiss the problem of disintegrations, which occupies the next place in our plan of inquiry, as a mere formality, on the assumption that disintegration must follow breakdown as surely as night follows evening?

Perhaps the best way to deal with this question that confronts us now will be to remind ourselves of how we dealt with the analogous question that has presented itself to us before. In this previous case we found that our impulse to dismiss a problem summarily on the strength of an abstract argument *a priori* was checked—as soon as we took our customary precaution of exploring the ground empirically—by an immediate discovery of concrete evidence which showed, in the mere fact of its palpable existence, that our problem was not an empty formality after all. The problem of the growths of civilizations was found to be raised in practical terms by the enigmatic but substantial presence, in the historical landscape, of five arrested civilizations,² every one of which had failed to grow in spite of having succeeded—unlike the four abortive civilizations³—in coming to birth. If we follow this clue in applying our well-tried empirical method once again, we

¹ See Part III. A, vol. iii, p. 1, above.

² The Polynesian, the Eskimo, the Nomadic, the 'Osmanli, and the Spartan (see Part III. A, in vol. iii, above).

³ The abortive Far Eastern Christian, Far Western Christian, and Scandinavian civilizations, and an abortive Syriac Civilization (see Part II. D (vii), in vol. ii, above).

shall find that our present problem of the disintegrations of civilizations is likewise substantiated by certain palpable matters of fact which have already come under our observation. The set of civilizations that have been arrested after their birth, before they have had time to begin to grow, has its analogue in another set of civilizations that have been petrified after their breakdown before they have had time to complete the downward course that runs through disintegration to dissolution.

The classic example of a petrified civilization is presented by a phase in the history of the Egyptiac Society which we have already had occasion to consider in several different contexts.¹ We have noticed that, after the Egyptiac Society had broken down under the intolerable burden that was imposed upon it by the Pyramid-Builders, and after it had then duly passed through the first and the second into the third of three phases of disintegration—a 'Time of Troubles' and a universal state and an interregnum—this apparently moribund Egyptiac Society then departed unexpectedly and abruptly, at a moment when it was on the verge of completing its life-course, from what we may provisionally regard as the standard pattern of the disintegration-process if we take for our norm the Hellenic case in which these three phases of disintegration first came to our notice.² At the point where the disintegration of the Hellenic Society reached what might be thought to be its natural termination—that is to say, at the point where this disintegration culminated in dissolution—the Egyptiac Society passionately refused to pass away and emulated the legendary *tour de force* of its own historic King Mycerinus³ by rebelling against the execution of the death-sentence which it had lawfully incurred and successfully doubling the period of grace which Fate had allotted to it. When we take the time-measure of the survival of the Egyptiac Society from the moment of its galvanic reaction against the Hyksos invaders in the first quarter of the sixteenth century B.C.⁴ down to the eventual obliteration of the last traces of a distinctive Egyptiac style of culture in the fifth century of the Christian Era, we find that this span of 2,000 years is at least as long as the combined span of the birth, growth, breakdown, and almost completed disintegration of the Egyptiac Civilization—reckoning back from the date of its passionate reassertion of itself in the sixteenth century B.C. to its first emergence above

¹ See I. C (ii), vol. i, pp. 136-46; III. C (i) (d), vol. iii, pp. 212-15; IV. C (ii) (b) 2, vol. iv, pp. 84-6; IV. C (iii) (c) 2 (β), vol. iv, pp. 408-14 and 418-23, above.

² See I. C (i) (a), vol. i, pp. 52-62, above.

³ See Herodotus, Book II, chaps. 129-34, for the legend of King Mycerinus (Ménakaure) of the Fourth Dynasty of the Egyptiac United Kingdom. (The legend has been cited in this Study already in IV. C (iii) (c) 2 (β), vol. iv, p. 409, above.)

⁴ See I. C (ii), vol. i, p. 144, above.

the primitive level at some unknown date in the fourth millennium B.C. Thus the Egyptiac Society did actually succeed—in spite of having broken down and gone into disintegration—in surviving for double the term of its natural expectation of life; but this unnatural longevity was bought at a price; for the life of the Egyptiac Society during this second aeon of existence which it had wrested from Fate was a kind of life-in-death. During those two supernumerary millennia a civilization whose career during the two preceding millennia had been so full of movement and of meaning—and this during its fall as well as during its rise—lingered on, on a level with the arrested civilizations and indeed with the primitive societies, as one of 'the peoples that have no history'. In fact, it survived by becoming petrified.¹

This extraordinary case of petrification which confronts us in Egyptiac history is perhaps sufficient in itself to dispose of the assumption that the breakdown of a civilization must inevitably be followed by a process of disintegration that runs straight out into dissolution in the Hellenic way. But the Egyptiac example of petrification does not stand alone. If we turn to the history of the main body of the Far Eastern Civilization in China, in which the moment of breakdown may be equated with the break-up of the T'ang Empire in the last quarter of the ninth century of the Christian Era,² we can trace the consequent process of disintegration duly following the normal course through a 'Time of Troubles' into a universal state—only to be pulled up in the universal state stage by a reaction of the same unexpected and abrupt and passionate kind as the Egyptiac Society's reaction in the interregnum following the Egyptiac universal state's disappearance. The Southern Chinese revolt, under the leadership of the founder of the Ming Dynasty, Hung Wu,³ against a Far Eastern universal state that had been established by the barbarian Mongols, is strongly reminiscent of the Theban revolt, under the leadership of the founder of the Eighteenth Dynasty, Amosis, against the 'successor-state' which had been erected on part of the derelict domain of the defunct Egyptiac universal state (the so-called 'Middle Empire') by the barbarian Hyksos.⁴ And

¹ For Ikhnaton's abortive act of creation, which was the exception that proved the rule of life-in-death during the Egyptiac aeon of petrification, see I. C (ii), vol. i, pp. 145-6, above, and V. C (i) (d) 6 (δ), Annex, in the present volume, pp. 695-6, below.

² See IV. C (ii) (b) 2, vol. iv, p. 86, above.

³ For the Ming Dynasty see II. D (v), vol. ii, pp. 121-2, and IV. C (ii) (b) 2, vol. iv, p. 87, above.

⁴ The common vein of convulsive fanaticism in the Chinese Anti-Mongol reaction and in the Theban Anti-Hyksos reaction may be accounted for by a characteristic which the Mongols and the Hyksos displayed in common. Neither of these intruding barbarian war-bands was unadulteratedly barbarian. Each of them had already acquired the tincture of a civilization which was different from the civilization towards which they were now playing the part of an external proletariat. The Hyksos had been

there has been a corresponding similarity in the sequel. For, like the Egyptiac Society, the Far Eastern Society in China has prolonged its existence in a petrified form instead of passing expeditiously through disintegration to dissolution by way of a universal state running out into an interregnum.

It is true that the survival of the Far Eastern Society in China in its petrified state cannot yet compare in duration with the period for which the Egyptiac Society contrived to survive in the same condition. So far, less than six centuries have elapsed since Hung Wu drove the Mongols out beyond the Great Wall in A.D. 1368; and at the present moment it looks as though the Far Eastern Society were fast losing its identity through being merged in 'the Great Society' of a Westernized World. The Egyptiac parallel suggests, however, that these present appearances in China may be deceptive; for if we take the expulsion of the Mongols from China in A.D. 1368 as having its Egyptiac counterpart in the expulsion of the Hyksos from Egypt *circa* 1580 B.C., we find that the year A.D. 1938, in which this volume went to press, is represented in the annals of Egyptiac history by some year in the neighbourhood of 1010 B.C.; and any open-eyed and candid-minded observer, either foreign or native, of the state of the Egyptiac Society in the latter decades of the eleventh century B.C. would almost certainly have taken then as pessimistic a view of the Egyptiac Society's expectation of life as we are apt to take now of the prospects of the Far Eastern Society in China. In spite of that, the Egyptiac Society actually continued to survive—weathering one storm after another in its state of quite incurable yet almost invincible decrepitude—for a further period of nearly 1,500 more years. And, on this showing, we may well hesitate to pronounce that, in our day, a petrified Far Eastern Society in China is within sight of extinction.¹

Thus, in the last phase of Chinese as well as Egyptiac history, we have an empirical proof that the breakdown of a civilization is not necessarily followed by a disintegration that runs out straight

infected with the Sumeric Civilization (see I. C (ii), vol. 1, p. 139, footnote 1, above) and the Mongols with the Abortive Far Eastern Christian Civilization (see II. D (v), vol. ii, p. 122, footnote 2; II. D (vi), vol. ii, pp. 237-8; II. D (vii), Annex VIII, vol. ii, pp. 449-51, above). This touch of an alien civilization in the social 'make-up' of the Hyksos and the Mongols is perhaps the common element which accounts for the exceptionally fanatical reaction which they evoked from their Egyptiac and Far Eastern victims. (On this question see further V. C (i) (c) 4, pp. 348-53, below.)

¹ So far from there being any certainty that the end of the Far Eastern Civilization in China was at hand in the year A.D. 1938, it seemed possible that this petrified society might be galvanized into a fresh lease of life-in-death by the extreme pressure of the Westernization which was now being applied to China through Japanese as well as through European and American channels. The galvanic effect, both upon the Far Eastern and upon the Egyptiac Society, of successive impacts of alien bodies social has been touched upon already in IV. C (ii) (b) 3, vol. iv, pp. 116-18, above.

into dissolution. And there is a possibility that these two clear cases of the phenomenon of petrification may be reinforced by no less than nine others, if we eventually decide that ten of the twenty-one civilizations which we provisionally identified in the first part of this Study are not, after all, independent societies existing in their own right, but are simply the 'dead trunks' of other trees which we have already counted in our list.¹ On this reckoning the Far Eastern Society itself would have to be regarded as being simply the 'dead trunk' of the Sinic Society; and this would apply to the offshoot of the Far Eastern Society in Korea and Japan, as well as to its main body in China. Similarly the Orthodox Christian Society, both in its Near Eastern main body and in its Russian offshoot, would figure as the 'dead trunk' of the Hellenic Society; and the Iranic and Arabic societies would assume the same role in Syriac history, the Mexic and Yucatec societies in Mayan history, the Hindu Society in Indic history, and the Babylonian Society in Sumeric history. If we take separate account of each of the two limbs of any bifurcating stem this procedure would bring our number of petrified civilizations up to eleven, namely:²

The Egyptian *inde ab Amosi*.

The Sinic in its Far Eastern epilogue in China.

The Sinic in its Far Eastern epilogue in Korea and Japan.

The Hellenic in its Orthodox Christian epilogue in the Near East.

The Hellenic in its Orthodox Christian epilogue in Russia.

The Syriac in its Iranic epilogue.

The Syriac in its Arabic epilogue.

The Mayan in its Mexic epilogue.

The Mayan in its Yucatec epilogue.

The Indic in its Hindu epilogue.

The Sumeric in its Babylonian epilogue.

Moreover, in the history of the Sinic Society in its Far Eastern epilogue in China, we should have one example of something which might aptly, though perhaps rather quaintly, be described as a kind of social biscuit, in which the process of petrification had been undergone twice over: first, when the Sinic Society became petrified in the shape of the Far Eastern Society after the interregnum (*circa* A.D. 175-475) following the break-up of the universal state of the Han Dynasty; and for the second time when the Chinese branch of this petrified form of the Sinic Society became petrified to a still higher degree through that process of reaction

¹ This question has been raised in I. C (ii), vol. i, pp. 133-46, above.

² Compare this catalogue with those in I. C (ii), vol. i, pp. 131-3, above.

against the Mongol universal state which resulted in the establishment of the Ming Dynasty in A.D. 1368.

Perhaps we shall be wise to dispense with these reinforcements; for we have already discovered that we cannot actually disqualify our ten contested civilizations without exposing ourselves to serious difficulties. For example, if we decide to regard the Orthodox Christian Society as being merely a 'dead trunk' of the Hellenic Civilization, then we cannot refuse—without falling into an unwarrantable inconsistency—to regard our own Western Society in the same light, since the Western and Orthodox Christian societies are sister growths whose relation to the Hellenic Society is manifestly identical, whatever the relation may prove to be. Yet it would be as repugnant to our common sense to dismiss our own Western history as a mere epilogue to Hellenic history, and to decline to see in it the history of an independent society existing in its own right,¹ as conversely it would seem unreasonable to us to

¹ In the table of affinities that has been adopted in this Study the Hellenic and the Western Civilization appear as two separate and independent societies which are connected with one another by the relation for which we have coined the name 'Apparentation-and-Affiliation'. A closer kinship between these two civilizations, in virtue of a common quality which distinguishes the pair of them from all others, is suggested in the following passage of a letter which the writer of this Study has received from Dr. Edwyn Bevan:

"You see the process of history rather as a continual repetition of civilizations, running courses in many respects analogous, whereas it looks to me much more like a single process of unique stages. At least that seems to me the case with our European or "Western" Civilization, though, of course, I allow that civilizations like the Chinese or Indian are separate movements which may now be debouching into a common stream (as Polybius says the history of the Mediterranean peoples did in the third century B.C.) but which have hitherto run alongside of our "Western" Civilization. We should both, no doubt, allow that any bit of the historical process has both certain unique characteristics and also certain characteristics common to other bits of the process; but, while your attention and interest is directed mainly to the common characteristics, it is the uniqueness which impresses me.

"For instance, to begin at the end, the present condition of the World seems to me something like which nothing has ever been before, since *Homo Sapiens* was on the planet. And behind our modern world in time is the ancient Greco-Roman Civilization, the "Hellenic Civilization", as you call it, which I see, not simply as a civilization, but as the unique beginning of something new in the history of Mankind. Never before the Greek culture came into being, never in parts of the globe outside the sphere of that culture, can we see a civilization of the same rationalist character. (I admit it is a question of *degree*: all Mankind are rationalist up to a point.) That started a particular section of Mankind on a new track. Yet rationalist civilization in its first embodiment came to grief and was overrun by primitive barbarians. Then, when it had gradually worked its way up again through the barbarian mass, it got a fresh embodiment in our modern "Western" Civilization. That is to say, rationalist civilization is to-day making only its *second* try, and it seems to me hazardous to found any large generalizations about "civilizations", when, in regard to the particular kind of civilization in which we are primarily interested, you have only *two* examples. I see the movement of rationalist civilization in human history as it might be a battalion's assault on a fortress. The first attack is brought to a standstill and then thrown back by the coming in of an alien body of troops; but, that alien body having been disposed of, the attack is made again under conditions markedly different. No doubt, as one studied the first attack and the second attack, one would see analogous points in them: they would both go over the same ground, and meet some of the same obstacles. But the whole process containing the two attacks would be a single process, a single *élan spirituel* in two efforts."

The writer of this Study has to confess that, on this important point, he finds himself unable to agree with a scholar for whose judgement he has a deep respect. To the present writer's eye the common element of rationalism which may be discernible in

erect the epilogue of Egyptiac history, in the aeon of petrification inaugurated by the establishment of the Eighteenth Dynasty, into the history of a distinct civilization claiming to be as independent of the Egyptiac as our Western Civilization appears in our eyes to be independent of the Hellenic. In this dilemma we shall probably still prefer to retain our original list of twenty-one distinct civilizations that have succeeded in passing from birth into growth, instead of attempting to reduce the number to ten.¹ On the other hand we shall be on sure ground in seeking reinforcements for our two undoubted specimens of petrification—the Egyptiac *post* 1580 B.C. and the Far Eastern in China *post* A.D. 1368—in our existing collection of fossils. Though we may not be warranted in labelling the Hindu Civilization as a petrified form of the Indic, or again the Iranic and Arabic civilizations as petrified forms of the Syriac, we need not doubt that we have discovered

the Hellenic and the Western Civilization is not so distinctive a quality as to mark this pair of societies off from all other representatives of the species. The Hellenic Society may have had a bent for rationalism—as the Western Society may have had one for machinery or the Indic Society one for religion (see III. C (iii), vol. iii, pp. 377-99, above). But the *floruit* of this Hellenic flower was as brief as it was brilliant (see IV. C (iii) (c) 2 (α), vol. iv, pp. 269-74, above, and V. C (i) (d) 6 (δ), pp. 545-68, below); and while it is, of course, true that there has been a renaissance of the Hellenic culture in the bosom of an 'affiliated' Western Society, and no less true that this Hellenic renaissance has tended to play an ever larger part in our Western life in the course of our Western history up to date, it would be begging the question (see I. B (iii), vol. i, p. 34, above) of what the essential character of the Western Civilization may be if we were simply to take it for granted that this is represented by just those elements in our Western life that can be traced to a Hellenic source. If we were to regard the Christian element in our Western culture as being the essence of it, then our reversion to Hellenism might be taken (as is suggested in Part VII, below) to be, not a fulfilment of the potentialities of Western Christendom, but an aberration from the proper path of Western growth—in fact, a false step which it may or may not be possible now to retrieve. In the present writer's view 'a unique beginning of something new in the history of Mankind' is to be seen, if anywhere, not in the flowering of a brilliant rationalism in the springtime of Hellenic history, but in the discovery—or revelation—of a new conception of God, and of Man's relation to God, which was made in the last phase of the dissolution of the Sumeric Society (if that is indeed the date and the provenance of Abraham), and which, ever since then, has gone on gathering light through a series of epiphanies of which the culmination has been Christianity. This view, which is put forward in Part VII, below, is not at variance with that of Mr. Bevan, as he has communicated it to the writer of this Study in a later letter in the same correspondence:

'I see I didn't make my view quite clear in one respect. I should hardly say that the significant central thread of History is the rise of Rationalism: I should say, rather, with you that the central thread is the preparation for the Kingdom of God and its partial coming. . . . I don't think that Rationalism is enough. It enables men to get hold better of the pattern of the Physical World, and by so doing gives them a much greater command of the physical means for accomplishing their ends; but it does not tell them what their ends ought to be. That is where the Kingdom of God comes in. . . . By "Civilization" I don't mean a right development of the whole spirit of Man or a right adjustment of human relations. I mean only an organization of society on rational principles for the attaining of certain ends, good ends or bad ends. . . . The word [Civilization] is ambiguous. You really want a different word for the kind of civilization which implies high moral and spiritual values and the kind which is simply scientific organization. . . . You may say: "A state in which the higher values of the human spirit are suppressed cannot be called 'Civilization'." Then you must find some word to distinguish such a state from an "uncivilized" condition in the sense of Primitive Barbarism. Might we say "Satanic"?'

¹ These ten civilizations which would then remain on our list would be the Egyptiac, Sinic, Hellenic, Syriac, Mayan, Indic, and Sumeric, together with the Hittite, the Minoan, and the Andean.

what are unmistakably fossilized fragments of the Indic Civilization in the Jains of India, the Hinayanian Buddhists of Ceylon, Burma, and Siam, and the Lamaistic Mahayanian Buddhists of Tibet and Mongolia, and similar fossilized fragments of the Syriac Civilization in the Parsees and the Jews and the Nestorians and the Monophysites.¹

In any case, however cautiously and conservatively we may feel it wise to interpret the findings of the empirical survey that we have just been attempting to make, the evidence seems amply sufficient to demonstrate that the disintegration of broken-down civilizations is not an automatic and inevitable process that can simply be taken for granted. Even when disintegration has set in it does not necessarily run straight out into dissolution; and, though this may still prove to be the normal course of events, the cases of departure from the norm, by way of petrification or fossilization, are numerous enough and striking enough to raise the question of the reasons why the declines and falls of civilizations should sometimes have this alternative denouement. Our classic example of disintegration running straight out into dissolution has been the latter end of the history of the Hellenic Civilization; yet, as an eminent modern Western historian has pointed out, this society which eventually made way for two fresh representatives of the species was at one stage all but overtaken by the petrification which has been the Far Eastern Civilization's fate:

'The spirit of the two most famous nations of Antiquity was remarkably exclusive. . . . The fact seems to be that the Greeks admired only themselves, and that the Romans admired only themselves and the Greeks. . . . The effect was narrowness and sameness of thought. Their minds, if we may so express ourselves, bred in and in, and were accordingly cursed with barrenness and degeneracy. . . . The vast despotism of the Caesars, gradually effacing all national peculiarities and assimilating the remotest provinces of the Empire to each other, augmented the evil. At the close of the third century after Christ the prospects of Mankind [*sic*] were fearfully dreary. . . . That great community was then in danger of experiencing a calamity far more terrible than any of the quick, inflammatory, destroying maladies to which nations are liable—a tottering, drivelling, paralytic longevity, the immortality of the Struldbrugs, a Chinese civilisation. It would be easy to indicate many points of resemblance between the subjects of Diocletian and the people of that Celestial Empire where, during many centuries, nothing has been learned or unlearned; where government, where education, where the whole system of life, is a ceremony; where knowledge forgets to increase and multiply, and, like the talent buried

¹ For the identification of these Indic and Syriac fossils see I, B (iii), vol. i, p. 35, and I. C (i) (b), vol. i, pp. 90-2, above.

in the earth or the pound wrapped up in the napkin, experiences neither waste nor augmentation. The torpor was broken by two great revolutions, the one moral, the other political, the one from within, the other from without.¹

This merciful release for which, on Macaulay's showing, the Hellenic Society in the Imperial Age was indebted to the Church and the Barbarians, is a relatively happy ending which cannot be taken for granted. So long as life persists it is always possible that, instead of being cut off sharp by Clotho's beneficently ruthless shears, it may stiffen, by imperceptible degrees, into the paralysis of life-in-death; and the possibility that this may be the destiny of the Western Civilization² haunts the mind of at least one distinguished Western historian of the present generation.

'I do not think the danger before us is anarchy, but despotism, the loss of spiritual freedom, the totalitarian state, perhaps a universal world totalitarian state. As a consequence of strife between nations or classes there might be local and temporary anarchy, a passing phase. Anarchy is essentially weak, and in an anarchic world any firmly organized group with rational organisation and scientific knowledge could spread its dominion over the rest. And, as an alternative to anarchy, the World would welcome the despotic state. Then the World might enter upon a period of spiritual "petrification", a terrible order which for the higher activities of the human spirit would be death. The petrification of the Roman Empire and the petrification of China would appear less rigid, because [in our case] the ruling group would have much greater scientific means of power. (Do you know Macaulay's essay on "History"? He argues that the barbarian invasions were a blessing in the long run because they broke up the petrification. "It cost Europe a thousand years of barbarism to escape the fate of China.")³ There would be no barbarian races to break up a future world totalitarian state.)

'It seems to me possible that in such a totalitarian state, while philosophy and poetry would languish, scientific research might go on with continuous fresh discoveries. Greek science did not find the Ptolemaic realm an uncongenial environment, and I think, generally speaking, natural science may flourish under a despotism. It is to the interest of the ruling group to encourage what may increase their means of power. That, not anarchy, is, for me, the nightmare ahead, if we do not find a way of ending our present fraternal strife. But there is the Christian Church there, a factor to be reckoned with. It may have to undergo martyrdom in the future world-state, but, as it compelled the Roman world-state in the end to make at any rate formal submission to Christ,

¹ Macaulay, Lord: 'History', in *Miscellaneous Writings* (London 1860, Longmans, Green, 2 vols.), vol. i, pp. 263-7.

² This possibility has been touched upon in this Study already in IV. C (iii) (b) 4, vol. iv, p. 179, above.

³ Macaulay, op. cit., vol. i, p. 268.—A.J.T.

it might again, by the way of martyrdom, conquer the scientific rationalist world-state of the future.¹

These reflections show that the disintegrations of civilizations present a genuine problem which demands consideration.²

¹ Dr. Edwyn Bevan, in the second of the two letters to the writer of this Study that have been quoted above.

² In this respect the history of Man in process of civilization runs true to the larger movement of the history of Life on this planet.

'The present condition of the Earth reveals to us an assemblage of differing forms of life. These different forms . . . are not all of the same age, they have existed for longer or shorter periods of time; some have persisted practically unchanged from the earliest observable geological formations, others are of relatively recent origin. A just view of the facts demands recognition, therefore, of the phenomenon of modification or change, in relation to the forms of life' (Teggart, F. J.: *Theory of History* (New Haven 1925, Yale University Press), p. 144).

B. THE NATURE OF THE DISINTEGRATIONS OF CIVILIZATIONS

LIKE the phenomenon of petrification, which compels us to study the problem of the disintegrations of civilizations, the different phenomena which reveal the nature of these disintegrations have already come to our notice incidentally. We have encountered them, for instance, in the history of the Hellenic Society, in our examination of the effects of the impact of the Solonian Economic Revolution upon the domestic politics of the Hellenic city-states¹ and upon the international politics of the Hellenic World.² We have met with other illustrations in the history of the Egyptiac Society, in our examination of a failure to throw off, before it was too late, the social incubus of a deified kingship, and a subsequent failure to avoid exploitation at the hands of a series of other social parasites: litterati and priests and professional soldiers.³

These passages of history bring to light certain likenesses and certain differences between the nature of the disintegrations of civilizations and the nature of their growths.

In studying the growths of civilizations we found⁴ that they could be analysed into successions of performances of the drama of Challenge-and-Response, and that the reason why one performance followed another was because each of the responses was not only successful in answering the particular challenge by which it had been evoked, but was also instrumental in provoking a fresh challenge, which arose each time out of the new situation which the successful response had brought about. Thus the essence of the nature of the growths of civilizations proved to be an *élan* which carried the challenged party through the equilibrium of an effective response into an overbalance which declared itself in the presentation of a new challenge; and it was this element of overbalance that converted the single act of Challenge-and-Response, which we had detected in the geneses of civilizations, into the repetitive, recurrent rhythm which the concept of growth implies. This repetitiveness or recurrency is likewise implied in the concept of disintegration, which resembles the concept of growth in signifying a process and not a mere single act; and we duly discern a corresponding rhythm in those illustrations of the

¹ In IV. C (iii) (b) 9, vol. iv, pp. 200-6, above.

² In IV. C (iii) (b) 10, vol. iv, pp. 206-14; and also in IV. C (iii) (c) 2 (β), vol. iv, pp. 304-15, above.

³ In IV. C (iii) (c) 2 (β), vol. iv, pp. 408-14 and 418-23, above.

⁴ In Part III. B, vol. iii, pp. 113-27, above.

nature of the disintegrations of civilizations that have already come under our eye.

In each individual performance of the drama of Challenge-and-Response we have, of course, here to write failure for success and to change the plus sign into a minus; but the successive defeats through which the process of disintegration works itself out do nevertheless resemble the successive victories which build up the process of growth inasmuch as they, too, constitute a continuous series in which each performance leads on to the next. For example, in the history of the international politics of the Hellenic World, from the time when the Solonian economic revolution first confronted the Hellenic Society with the task of establishing a political world order, we can see that the failure of the Athenian attempt to solve the problem by means of the Delian League led on to Philip of Macedon's attempt to solve it by means of the Corinthian League, and Philip's failure to Augustus's attempt to solve it by means of a *Pax Romana* upheld by a Principate. Similarly, in the history of the Egyptiac Society's struggle with the problem of social incubuses, we can see that the failure to throw off the incubus of a deified kingship led on to a progressive complication of the unsolved problem as the litteratus and the priest and the professional soldier successively mounted, behind the king, upon the peasant-packhorse's back. In this matter of recurrency in rhythm the nature of the disintegrations of civilizations unmistakably resembles the nature of their growths. On the other hand our examples have already brought out a point of diversity which is no less striking or important than the point of likeness.

In a repetition of performances of the drama of Challenge-and-Response, where the outcome is a process of growth, the fact that the successive performances constitute a series, in which each performance is a consequence of its predecessor, does not mean that the play is staged each time with exactly the same plot. So far from that, we find that in the growth-process a particular challenge is never presented more than once, and indeed, *ex hypothesi*, could not be presented for a second time, since, *ex hypothesi*, so long as growth is being maintained, each successive challenge in the series is being successfully met or, in other words, disposed of as a living issue and relegated to the archives of the Recording Angel as another chapter of past history. By contrast, we can see that, in a series in which the outcome of each successive encounter is not victory but defeat, the unanswered challenge can never be disposed of and is therefore bound to present itself again and again until it either receives some tardy and imperfect answer or else brings about the destruction of a society which has shown

itself inveterately incapable of responding to it effectively.¹ Thus, in the disintegrations of civilizations, the perpetual variety which gives light and life to their growths is replaced by a merciless uniformity;² and intensification, instead of diversification, is the form of change which now relieves the monotony of the series of performances. At each performance, now, the challenge is the same as it has been at every performance that has gone before since the tragic performance which witnessed the original breakdown; but, after each successive failure to respond to it, the old unanswered challenge presents itself ever more insistently and in an ever more formidable shape, until at last it quite dominates and obsesses and overwhelms the unhappy souls that are being progressively defeated by it.

Thus the disintegration of a civilization, like its growth, is a cumulative as well as a continuous process. At the same time, when we are dealing with disintegration, there might seem, at first sight, to be no necessity to deny ourselves the use of the convenient spatial metaphor of 'direction', which we hesitated to apply when we were attempting to comprehend the nature of growth.³ The direction in which disintegration runs might seem to be only too clear. Does not the disintegration of a civilization run to a defeat which brings with it the alternative penalties of an extinction without reprieve and a petrification which is no true mercy, since it is bound to end in dissolution sooner or later and amounts, for however long it may last, to nothing but a meaningless and savourless life-in-death?

This view of the nature of the disintegrations of civilizations may convey a part of the truth. It may be true, as far as it goes, to say that, when once a civilization has broken down—or, at any rate, if and when an original breakdown has been confirmed by a certain number of failures to retrieve the lost position—then the broken-down civilization is (in mythological language) remorselessly condemned to eventual destruction or (in scientific language) mechanically dispatched to the same grim goal on a travelling belt of interlocking cause and effect that can be neither reversed nor broken nor checked. In so far as this is true, the last word on the disintegration of a civilization would seem to be the sublime and chilling Lucretian *Concede: necessest*.⁴ But it would hardly be wise to concur in this famous verdict without being sure that our judgement has been formed in the light of the whole truth, as far as it may be possible for us to comprehend it. The Solonian *Respite*

finem,¹ if it hits the mark at all, is presumably pertinent to all cases; and, until we have seen the end of an individual or a society, to pronounce an absolute verdict of either happiness or unhappiness may be equally premature. 'Whom the Lord loveth he chasteneth'² may be as near to the ultimate truth as the dictum, attributed to Solon by Herodotus, that 'to many people God has given a glimpse of happiness in order to destroy them root and branch'.³ The 'son' whom we now see being 'scourged' may be found, in a later act, to be 'received'⁴ after he has passed through his appointed ordeal. We cannot say our last word about the nature of the disintegrations of civilizations till we have studied the process of disintegration from beginning to end, and this in its inward experiences as well as in its outward manifestations.

C. THE PROCESS OF THE DISINTEGRATIONS OF CIVILIZATIONS

(I) THE CRITERION OF DISINTEGRATION

(a) A LINE OF APPROACH

IN our study of the process of the growths of civilizations we began by looking for a criterion of growth¹ before we attempted to make an analysis of the process;² and in studying now the analogous process of the disintegrations of civilizations we may take our cue from the analogy³ by applying the same plan of operations *mutatis mutandis*. One welcome difference in our procedure will be that we shall find ourselves absolved, this time, from re-tracing all the steps of our previous inquiry; for this inquiry has already led us to the conclusion that the criterion of growth is not to be found in an increasing command over the environment, either human or physical,⁴ while conversely a loss of command over the environment of either kind has not proved to be the cause of the breakdowns of civilizations.⁵ An empirical survey has left us doubtful whether there is any ascertainable correlation at all between the historical variations in the degree of a society's control over its environment and the historical change in the fortunes of a society whose growth is cut short by a breakdown running into a disintegration. And the evidence, so far as it goes, suggests that, if some correlation did prove to exist, we should find that an increase in command over the environment was a concomitant of breakdown and disintegration and not of growth.⁶

It looks, in fact, as though the internal struggles within the bosom of a society which bring the society's breakdown about, and which become more and more violent as its consequent disintegration proceeds, were actually more effective than the activities of genesis and growth in promoting the extension of the society's command both over the life of other living societies and over the inanimate forces of Physical Nature. In the downward course of a broken-down civilization's career there may be truth in the Ionian philosopher Heracleitus's saying that 'War is the father of all things'.⁷ The sinister concentration of the society's dwind-

¹ In III. C (i), vol. iii, above.

⁴ See III. C (i) (a) and (b), vol. iii, above.

⁵ See IV. C (ii), vol. iv, above.

⁶ See III. C (i) (a), vol. iii, pp. 139-54, and III. C (i) (b), vol. iii, *passim*, as well as IV. C (ii), vol. iv, above.

⁷ Heracleitus, fragment 45. It may be noted that, in the life-time of Heracleitus (*vivebat circa* 500 B.C.), Ionia, which had been the cradle of a creative minority in the first chapter of the growth of the Hellenic Society (See III. C (ii) (b), vol. iii, pp. 338-9, above), was already verging towards her decline, though the Hellenic Society as a whole was at that time still in vigorous growth.

ling powers upon the absorbing business of fratricidal warfare may generate a military prowess that will place the neighbouring societies at the war-obsessed society's mercy, and may strike out a military technique that will serve as a key to the acquisition of a far-reaching technical mastery over the Material World. Since the vulgar estimates of human prosperity are reckoned in terms of power and wealth, it thus often happens that the opening chapters in the history of a society's tragic decline are popularly hailed as the culminating chapters of a magnificent growth; and this ironic misconception may even persist for centuries. Sooner or later, however, disillusionment is bound to follow; for a society that has become incurably divided against itself is almost certain to 'put back into the business' of war the greater part of those additional resources, human and material, which the same business has incidentally brought into its hands.

For instance, we see the money-power and man-power which had been won for the Hellenic Society through Alexander's conquest of the Achaemenian Empire being poured into the civil wars between Alexander's successors. The power of the same two kinds which was subsequently swept together into Roman hands through the establishment of Rome's military supremacy over the Hellenic World was almost as quickly expended in the Roman civil wars that preceded the establishment of the *Pax Augusta*. The first charge on the spoils taken by the Spanish *conquistadores* from the Aztecs and the Incas was the provision of the sinews of war for fratricidal struggles between the demoralized parvenu masters of a New World, while the residue that reached the coffers of these adventurers' lawful sovereign in Spain was blown from the cannon's mouth on the battlefields of sixteenth-century and seventeenth-century Europe.¹ Finally, in this same Western Society in our own generation, we have seen all the human and material resources of a Westernized and industrialized world being mobilized to feed the furnaces of Moloch in which *Homo Occidentalis* has made a holocaust of his own children in our great Western civil war of A.D. 1914-18.

Thus the increasing command over the environment which an ironic or malicious or retributive Providence is apt to bestow upon a society in disintegration only serves, in the end, to put a greater driving-power into the suicidally demented society's chosen work of self-destruction; and the story turns out to be a simple illustration of the theme that 'the wages of Sin is Death'.² Our criterion

¹ The historical 'law' exemplified in the self-destruction of the Macedonian and Castilian *conquistadores* has been examined in IV. C (iii) (c) 3 (α), vol. iv, pp. 484-6, above.

² Romans vi. 23.

for the process of the disintegration of a civilization has to be sought elsewhere; and the clue is given to us in the spectacle of that division and discord within the bosom of a society to which an increase in its command over the environment can so often be traced back. This is only what we should expect; for we have found already¹ that the ultimate criterion and the fundamental cause of the breakdowns of civilizations is an outbreak of internal discord through which they forfeit their faculty for self-determination.

The social schisms in which this discord partially reveals itself rend the broken-down society in two different dimensions simultaneously. There are 'vertical' schisms between geographically segregated communities and 'horizontal' schisms between geographically intermingled but socially segregated classes.

In the 'vertical' type of schism the articulation of the society into a number of parochial states gives rise to an internecine warfare on a crescendo note between these nominal members of one and the same body social; and this warfare exhausts the energies of the society before it brings itself to an end through a 'knock-out blow' in which a single surviving state is left staggering, half-dead, among the corpses of its fellow combatants. In an empirical survey of a considerable range we have seen how frequently the fatal discord takes this 'vertical' form of destructive warfare between states. Indeed, in no less than fourteen out of the sixteen cases² in which we can pronounce with assurance that a broken-down civilization has brought the breakdown upon itself, we have found that a reckless indulgence in the crime of inter-state warfare has been the main line of suicidal activity.³ At the same time we may observe that this 'vertical' kind of schism is perhaps not the most characteristic manifestation of the discord by which the breakdowns of civilizations are brought about; for the articulation of a society into parochial communities is, after all, a phenomenon which is common to the whole genus 'Human Societies', and is not peculiar to the species 'Civilizations'. This 'vertical' articulation is part of the heritage which civilizations have derived from societies of the primitive species. The so-called 'civilized' state is merely an imposing, 'high-powered' version of the primitive

¹ In IV. C (iii) (a), vol. iv, pp. 119-33, above.

² For these sixteen cases see IV. C (ii) (b), *passim*, vol. iv, especially p. 115, above.

³ The two exceptional cases are the Egyptiac and the Iranic. The breakdown of the Egyptiac Civilization seems to have been due mainly to the idolization of an institution (a deified kingship), and the breakdown of the Iranic Civilization mainly to a religious schism (a recrudescence of the long dormant conflict between Sunnah and Shi'ah). The militant outbreak of Shi'ism in the Iranic World was, of course, followed by fratricidal warfare between the Safawis and the 'Osmanlis (see I. C (i) (b), Annex I, in vol. i, above). For the incubus of the Pharaonic Crown see IV. C (iii) (c) 2 (β), vol. iv, pp. 408-14, above.

tribe; and, while the internecine warfare between states in the bosom of a civilization is vastly more destructive than the feeble and desultory warfare between tribes in the bosom of a primitive society, this method of suicide is merely an abuse of a potential instrument of self-destruction which is within the reach of any society of either species. On the other hand the 'horizontal' schism of a society along lines of class is not only peculiar to civilizations but is also a phenomenon which first appears at the moment of their breakdowns and which is a distinctive mark of the phases of breakdown and disintegration, by contrast with its absence during the phases of genesis and growth.¹

We have come across this 'horizontal' kind of schism already in several different contexts in earlier parts of this Study.

We encountered it first when we were exploring the extension of our own Western Society backwards in the Time-dimension. We found ourselves led back to the Christian Church and to a number of barbarian war-bands which had come into collision with the Church in Western Europe inside the northern frontiers of the Roman Empire; and we observed that each of these two institutions—the war-bands and the Church—had been created by a social group which was not, itself, an articulation of our own Western body social and which could only be described in terms of another society, antecedent to ours, which we have labelled 'the Hellenic'. We found that we had to describe the creators of the Christian Church as 'the internal proletariat' and the creators of the barbarian war-bands as the 'external proletariat' of this Hellenic Society.²

At a later point in our inquiry³ we made use of the three institutions upon which we had thus accidentally stumbled—that is to say, the Roman Empire and the barbarian war-bands and the Christian Church—as tokens of a relation which we had found

¹ This is not, of course, to say that either in a primitive society or in a civilization in its growth-stage horizontal lines of social articulation are unknown. So far from that, it is manifest that the structure of both these kinds of society is often highly hierarchical; and some of the hierarchical distinctions to which they are prone are also of a genealogical order which opposes a formidable barrier to the transit of individuals or families from one rank in the hierarchy to another. Even, however, where the gulfs between ranks cannot easily be crossed on bridges of intermarriage or adoption, this 'racial' cleavage in a primitive society or in a growing civilization is not apt to produce a moral schism, because the different ranks which are divided in 'race' are apt to be united morally by a common consciousness of having reciprocal functions to perform which are all indispensable for the welfare, and even perhaps for the preservation, of a society which is one and indivisible. (An example of this unity in diversity is the social relation between knights and vassals which was the ideal—though not always the practice—of our own medieval Western feudal system.) The other chief 'horizontal' line of division in primitive societies is the distinction between different age-classes; and this hierarchy of ages is sometimes elaborately articulated and graded; but an age-class is, of course, in its very nature, a form of 'horizontal' division which is transcended inevitably through the passage of Time.

² See I. B (iv), vol. i, pp. 40-3, above.

³ In I. C (i), vol. i, above.

subsisting between the Hellenic Society and our own Western Society, and which we had labelled 'Apparentation-and-Affiliation'. Our immediate purpose at that stage was to discover, by the test of these tokens, whether there were other known instances of this relation between two civilizations which we had come across so far in a single example; and our ulterior purpose was to identify as many representatives as possible of the species of society which we have labelled 'Civilizations'. In order, however, to employ our three tokens with better effect, we found ourselves led to examine and define them more closely; and this inquiry led on, in its turn, to a subsidiary inquiry¹ into the respective origins and natures, and into the mutual relations, of the different social groups to which our three institutions severally owed their existence in the Hellenic World in which we had come across them.

We found that 'the internal proletariat' of the Hellenic Society, which was the creator of the Christian Church, and its 'external proletariat', which was the creator of the barbarian war-bands, had each arisen through an act of secession from the Hellenic body social during a 'Time of Troubles' in which the Hellenic Society itself was manifestly no longer creative but was already in decline; and, pushing our inquiry another stage back, we further found that these secessions of an internal and an external 'proletariat' had been provoked by an antecedent change in the character of the ruling element in the Hellenic body social. A 'creative minority' which had once evoked a voluntary allegiance from the uncreative mass, in virtue of the gift of charm which is the privilege of creativity, had now given place to a 'dominant minority' which found itself unable to exert the charm because it was destitute of the creative power. This uninspired minority, into whose hands the heritage of leadership had thus passed, could not bring itself to surrender a position of authority and eminence that it lacked the genius to earn; and, rather than climb down from the saddle, it set itself to keep its seat by force. This policy of sheer repression on 'the dominant minority's' part—a policy which was as impracticable as it was wrong-headed—was the grievance which had estranged the 'proletariat' to the point of revolt. The secessions which had eventually resulted in the creation of the barbarian war-bands and of the Christian Church were reactions to the sting of 'the dominant minority's' whip and to the prick of its spurs. Yet this defeat of its own intentions—through the disruption of a society which it was attempting, however perversely, to hold together—is not the only achievement of 'the dominant minority' that came to our notice in this context. If the barbarian

¹ In I. C (i) (a), vol. i, pp. 52-62, above.

war-bands and the Christian Church are the Hellenic 'proletariat's' handiwork, the Hellenic 'dominant minority' has also left a monument of itself in the shape of the Roman Empire; and the Empire not only took shape earlier than either the Church or the war-bands: its mighty presence in the world in which these 'proletarian' institutions grew up was a factor in the growth of both of them which cannot be left out of account. This universal state in which the Hellenic 'dominant minority' encased itself was like the carapace of a giant tortoise; and while the Church was reared under its shadow—partly profiting by the protection of this borrowed shield, and partly fighting for life against the crushing pressure of its weight—the barbarians trained their war-bands by sharpening their claws on the tortoise-shell's outer face.

Finally, at a third point in the course of this Study,¹ we tried to obtain a clearer view of the nexus of cause and effect between the loss of a leading minority's gift for creation and the loss of its faculty for attracting the majority by charm without having to think of resorting to force. And here we put our finger upon the Creative Minority's expedient of social drill—as a short-cut for bringing the uncreative mass into line—in which we had already² found the weak spot in the relation between minority and majority in the growth-stage. On this showing, the estrangement between minority and majority which eventually comes to a head in the secession of the Proletariat is a consequence of the breaking of a link which, even in the growth-phase, has only been maintained by playing upon a well-drilled faculty of mimesis; the leaders' failure to continue to play upon this faculty in the rank-and-file is a consequence of the same leaders' failure to reply to a particular challenge by making a creative response; and it is no longer surprising to find that the link inevitably snaps when the leaders' creativity gives out, considering that, even in the growth-stage of the society's history, this link of mimesis has always been precarious by reason of a treacherous duality—the revenge of an unwilling slave—which is part of the nature of any mechanical device.³

These are the threads of inquiry into the 'horizontal' kind of schism in a broken-down society that are already in our hands; and perhaps the most promising way of attempting to pursue our inquiry farther will be to draw these threads together and then spin out the strand.

Our first step⁴ will be to take a closer and wider survey of the three fractions—Dominant Minority and Internal and External

⁴ In V. C (i) (c), pp. 35-276, below.

Proletariats—into which a broken-down society splits when a 'horizontal' schism rends its fabric. So far we have only had occasion to glance at the Hellenic examples; but, since we have found¹ that the respective institutional products of the Dominant Minority and the two divisions of the Proletariat—the institutions of universal state and universal church and barbarian war-bands—are not peculiar to the Hellenic Society but can also be identified in the histories of a number of other societies in their later phases, there is a presumption that each of these other societies, likewise, has split into fractions corresponding to the three which, as creators of the three institutions aforesaid, have already come to our attention in the history of the Hellenic Society in its decline. Our second step² will be to turn—as we turned at a certain point³ in our study of the process of growth—from the Macrocosm to the Microcosm; for, after studying the 'horizontal' schism in the fabric of a disintegrating society under its outward aspect of an increasing discord in the body social, we shall find ourselves moved to re-study it under the complementary inward aspect of an increasing distraction in the soul. Both these lines of search for a criterion of disintegration will lead us to the, at first sight, paradoxical discovery that the process of disintegration works out, at least in part, to a result which is logically incompatible with its nature—works out, that is to say, to a 'recurrence of birth' or 'palíngenesia'.⁴ And this paradox will command our attention⁵ before we address ourselves to an analysis of disintegration by examining, first the relation between disintegrating civilizations and the individual human beings who are 'members' of them,⁶ and then the interaction between these individuals through which the process of disintegration works itself out.⁷ Thereafter, when we are in a position to view the whole course of the process in retrospect,⁸ we shall find, as indeed we might expect, that the qualitative change which it brings with it is exactly opposite in character to that which is the outcome of growth. In a previous part of this Study⁹ we have seen that in the process of growth the several growing civilizations become differentiated from one another. We shall now find that, conversely, the qualitative effect of the disintegration-process is standardization.

This tendency towards standardization is the more remarkable when we consider the extent of the diversity which it has to over-

come. The broken-down civilizations bring with them, when they enter upon their disintegration, the extremely diverse dispositions—a bent towards Art or towards Clockwork, or whatever the bent may be—that they have severally acquired during their growth. And they are also further differentiated from one another in a second sense by the fact that their breakdowns overtake them at widely different ages. The Syriac Civilization, for example, broke down, *post mortem Salamonis*, circa 937 B.C.,¹ at a date which was probably less than two hundred years removed from the date of the original emergence of this civilization out of the post-Minoan interregnum. On the other hand the sister Hellenic Civilization, which emerged out of the same interregnum coevally, did not break down for another five hundred years, if we are right in equating its breakdown with the outbreak of the great Atheno-Peloponnesian War in 431 B.C.² Again, the Orthodox Christian Civilization broke down upon the outbreak of the great Bulgaro-Roman War in A.D. 977,³ while in this case the sister civilization, which is our own civilization of the West, unquestionably went on growing for several centuries longer and—for all that we know—may not have broken down even yet,⁴ at an age when the breakdown of the Orthodox Christian Civilization is now little less than a thousand years behind us in the past.⁵ If sister civilizations can run to such different lengths of growth-span as we find in these two examples, it is manifest that the growths of civilizations are not predestined to any uniform duration; and indeed we have failed to find any convincing reason *a priori* why a civilization that has successfully come to birth, and has avoided the danger of becoming arrested in infancy, should not be able to go on growing *in saecula saeculorum*.⁶ These considerations make it clear that the differences between growing civilizations are extensive and profound. Nevertheless, in the history of a civilization that has been overtaken by the catastrophe of breaking down, we shall find that, as its subsequent disintegration proceeds, the process tends to conform to a standard pattern. A 'horizontal' schism regularly splits the disintegrating society into the same three fractions—Dominant Minority and Internal and External Proletariats—and these three separate social groups which the schism has brought into

¹ See IV. C (ii) (b) 1, vol. iv, pp. 67–8, above.

² See IV. C (ii) (b) 1, vol. iv, p. 62, above.

⁴ For a tentative diagnosis of the symptoms see V. C (ii) (b), vol. vi, pp. 312–21, and also Part XII, below.

⁵ Even if the Western Civilization were to prove, in retrospect, to have broken down upon the outbreak of the Wars of Religion in the sixteenth century, its growth-span would be longer, even so, than the growth-span of the sister Orthodox Christian Society by a tale of little less than 600 years.

⁶ This problem has been discussed in IV. C (i), vol. iv, above.

existence then regularly create the three institutions—universal state and universal church and barbarian war-bands—that are severally their characteristic handiwork.

We shall have to notice these institutions, as well as their respective creators, if our study of the disintegrations of civilizations is to be comprehensive. But, we shall find it convenient, so far as it may prove possible, to study the institutions for their own sakes in separate parts of the book¹—partly because an attempt to complete our examination of them in the present part would heavily overload it, but also for the stronger reason that these three institutions that are apt to arise in the course of the disintegration of a civilization are something more than mere products of the disintegration-process. Our early encounters with them in this Study² have shown us that they may also play a role in the relations between one civilization and another; and when we examine the universal churches we shall find ourselves led to raise the question whether churches can really be comprehended in their entirety in the framework of the histories of civilizations, within which they make their first historical appearance, or whether we have not to regard them as representatives of another species of society which is at least as distinct from the species 'Civilizations' as the civilizations are distinct from the primitive societies.

This may prove to be one of the most momentous questions that a study of history, within our present range of vision, can suggest to us; but the question lies near the farther end of the line of inquiry which we have just been sketching out. We must begin by returning to our starting-point, which is the 'horizontal' schism of a broken-down society into the three fractions that we have labelled the Dominant Minority and the Internal and External Proletariats.

(b) THE MOVEMENT OF SCHISM-AND-PALINGENESIA

In an anticipatory attempt³ to picture to ourselves the progressive estrangement of the Proletariat from the Dominant Minority in the Hellenic World, in the course of the decline of the Hellenic Civilization, we helped ourselves out by quoting a brilliant and penetrating passage from a famous work of a nineteenth-century French philosopher, de Gobineau.⁴ We may fitly cap this quotation now by another from the *Summa Philosophiae*

¹ In parts VI, VII, and VIII, below.

³ In I. C (i) (a), vol. i, p. 54, above.

⁴ De Gobineau, le Comte J. A.: *Essai sur l'Inégalité des Races Humaines*, vol. i, pp. 93-4.

of de Gobineau's countryman of an older generation, Saint-Simon,¹ for in this passage the social schism that follows the transition from an 'organic period' (i.e. an age of growth) to a 'critical period' (i.e. an age of disintegration)² is delineated in general terms and not merely with reference to the Hellenic instance.

'Aux époques organiques le but de l'activité sociale est nettement défini; tous les efforts . . . sont consacrés à l'accomplissement de ce but, vers lequel les hommes sont continuellement dirigés, dans le cours entier de leur vie, par l'éducation et la législation. Les relations générales étant fixées, les relations individuelles, modelées sur elles, le sont également; l'objet que la société se propose d'atteindre est révélé à tous les cœurs, à toutes les intelligences; il devient facile d'apprécier les capacités les plus propres à favoriser sa tendance, et les véritables supériorités se trouvent naturellement alors en possession du pouvoir; il y a légitimité, souveraineté, autorité, dans l'acception réelle de ces mots. L'harmonie règne dans les rapports sociaux. . . .

'Les époques critiques offrent un spectacle diamétralement opposé. On aperçoit, il est vrai, à leur début, un concert d'activité, déterminé par le besoin généralement éprouvé de détruire; mais la divergence ne tarde pas à éclater et à devenir complète, de toutes parts l'anarchie se manifeste, et bientôt chacun n'est plus occupé qu'à s'approprier quelques débris de l'édifice qui s'écroule et se disperse, jusqu'à ce qu'il soit réduit en poussière. Alors le but de l'activité sociale est complètement ignoré, l'incertitude des relations générales passe dans les relations privées; les véritables capacités ne sont plus et ne peuvent plus être appréciées; la légitimité du pouvoir est contestée à ceux qui l'exercent; les gouvernants et les gouvernés sont en guerre; une guerre semblable s'établit entre les intérêts particuliers, qui ont acquis chaque jour une prédominance plus marquée sur l'intérêt général.'³

This Saint-Simonian sketch of the social strife that accompanies the disintegration of any civilization has been almost effaced in the minds of Posterity by that tremendous picture of the class-war which has been painted—in colours borrowed from the apocalyptic visions of a repudiated religious tradition—by another Western philosopher of a later generation: the German Jew Karl Marx (*vivebat* A.D. 1818–83). The extraordinary impression which the Marxian materialist apocalypse has made upon so many millions of minds—and this often at second or third hand, and at levels of intellectual culture at which the Master's *ipsissima verba* would be unintelligible—is, of course, due in part to the political militancy, as well as to the philosophical impressiveness, of the Marxian

¹ De Gobineau *vivebat* A.D. 1816–1882; Saint-Simon *vivebat* A.D. 1760–1825.

² For these two technical terms of Saint-Simon's philosophy see I. C (iii) (b), vol. i, p. 154, footnote 4, and Part II. B, vol. i, pp. 199–200, above.

diagram; for, while this 'blue-print' is the kernel of a general philosophy of history, it is also a revolutionary call to arms in which the industrial proletariat of our latter-day Western World is incited to secede from a 'capitalist' dominant minority and is invited to carry this act of secession to its logical conclusion by shaking off physically an odious and intolerable yoke against which it is assumed already to have risen in spiritual revolt. Whether the invention and the vogue of this Marxian formula of the class-war are to be taken as signs that the civilization of our Western World, in which this portent has now appeared, has its feet already set upon the path of disintegration, is a question which will occupy us in a later part of this Study¹ when we come to look into the prospects of this Western Civilization of ours. In this place we have cited Marx for other reasons: first, because he is the classic exponent of the doctrine of the class-war for our world in our age; and, second, because his formula conforms to the traditional Zoroastrian and Jewish and Christian apocalyptic pattern in unveiling, beyond a violent climax, the vision of a gentle finale.

According to the Communist prophet's intuition of the operations of his familiar goddess Historical Materialism or Determinism or Necessity, the class-war is bound to issue in a victorious proletarian revolution; but this bloody culmination of the struggle will also be the end of it; for the victory of the Proletariat will be decisive and definitive and 'the Dictatorship of the Proletariat', by which the fruits of the victory are to be safeguarded and harvested during the post-revolutionary period, is not to be a permanent institution. A time is to come when a new society that has been classless from birth will be old enough and strong enough to dispense with 'the Dictatorship of the Proletariat'—as, in the Gospel story, the paralytic who has been miraculously healed by Jesus demonstrates the reality of the cure by obeying the Master's command to take up his bed and walk.² Indeed, in its final—and permanent—acme of well-being the New Society of the Marxian Millennium will be able to cast away not only 'the Dictatorship of the Proletariat' but also every other institutional crutch, including the State itself; for in that Marxian earthly paradise to come 'they neither marry nor are given in marriage, but are as the angels which are in Heaven'.³

The interest of the Marxian eschatology for our present inquiry lies in the surprising yet unquestionable fact that this lingering political shadow of a vanished religious belief does accurately

¹ In Part XII, below.

² Matt. ix. 1-8 = Mark ii. 1-12 = Luke v. 18-26 = John v. 1-16.

³ Mark xii. 25.

plot out the actual course which the class-war, or 'horizontal' schism, in a broken-down society is apt to follow as a matter of historical fact that can be ascertained from an empirical survey of the histories of societies in disintegration. History duly reveals to us in the phenomenon of disintegration a movement that runs through War to Peace; through Yang to Yin;¹ and through an apparently wanton and savage destruction of precious things, created in the Past by Time and Toil and Love, to fresh works of creation that seem to owe their special quality to the devouring glow of the flame in which they have been forged.

The schism in itself is a product of two negative movements, each of which is inspired by an evil passion. First the Dominant Minority attempts to hold by force—against all right and reason—a position of inherited privilege which it has ceased to merit; and then the Proletariat repays injustice with resentment, fear with hate, and violence with violence when it executes its act of secession. Yet the whole movement ends in positive acts of creation—and this on the part of all the actors in the tragedy of disintegration. The Dominant Minority creates a universal state, the Internal Proletariat a universal church, and even the External Proletariat a bevy of barbarian war-bands.

These three achievements are, no doubt, extremely unequal in the respective degrees of the creativity that they manifest. We have noticed at an earlier point² that the universal church, alone of the three, has a prospect in the Future as well as a footing in the Past, while the universal state and the war-bands belong to the Past exclusively. And it hardly needs to be pointed out that, of the two backward-looking institutions, the barbarian war-bands are poor affairs indeed compared with the universal state. By creating a universal state the Dominant Minority performs the worthy feat of checking, for a time, the process of social disintegration which its own past action has precipitated, and thus enabling the temporarily reprieved society to enjoy a brief 'Indian Summer'.³ In creating barbarian war-bands the External Proletariat has merely sharpened its predatory beak and claws in preparation for a carrion-crow's feast upon a dead civilization's carcass. Nevertheless there is a gleam of creativeness to be discerned, even here, in the contrast that strikes our eye if we compare the war-bands that were led by Theodoric the Ostrogoth to Rome, or by Mu'ā-wiyah the Umayyad to Damascus, with the hordes of Cimbri and

¹ For the alternating forces or phases in the rhythm of the Universe which Sinic philosophers have called Yin and Yang, see Part II. B, vol. i, pp. 201-4, above.

² In I. C (i) (a), vol. i, pp. 56-62, above.

³ For this phenomenon of 'Indian Summers' in the penultimate stage of the disintegrations of civilizations see IV. C (ii) (b) 1, vol. iv, pp. 56-76, above.

Teutones that had flooded across the Alps at the turn of the second and the last century B.C., or with the hordes of Ituraeans that had silted up, at about the same date, out of the North Arabian Desert against the eastern flanks of Hermon and Antilibanus.¹

Thus the social schism that is the outward criterion of the disintegration of a broken-down society is not just a schism and nothing more. When we grasp the movement as a whole, from beginning to end, we find that we have to describe it as Schism-and-Palingenesia² if we wish to give it a title that does it justice. And, considering that a secession is manifestly a particular manner of withdrawal, we may classify the specific double movement of

¹ For the difference in degree of barbarity between different representatives of the Hellenic external proletariat see further V. C (i) (c) 3, pp. 223-7, below.

² 'Palingenesia' is a Greek word (*παλιγγενεσία*) which occurs twice in the New Testament—in Matt. xix. 28 and in Titus iii. 5—and which in both these passages is translated by the English word 'regeneration' in the Authorized Version. This compound abstract substantive noun is derived from the verbal phrase *παλιν γίγνεσθαι*, which is used by Plato, in a passage (*Timaeus*, 23 B) that has been quoted in IV. C (i), vol. iv, pp. 24-5, above, to describe the fresh start which has to be made periodically by Human Society in Hellas and elsewhere, in contrast to an allegedly unbroken continuity of Civilization in the Egyptian World. The substantive was perhaps coined out of the verbal phrase in order to serve as a technical term in the vocabulary of the Stoic philosophy (see Dey, J.: *Παλιγγενεσία* (Münster i. W. 1937, Aschendorff), pp. 6-13 and 25), which needed a special word to describe the opening of each round of an endlessly and unvaryingly repeated cyclic movement of the Universe. (For this theory of cycles, which is not peculiar to Stoicism, see IV. C (i), vol. iv, pp. 23-38, above.) There is a clear case of this Stoic usage of the word from a Stoic hand in Marcus Aurelius Antoninus: *Meditations*, Book XI, chap. 1, and there are nine examples of it in the Anti-Stoic treatise *De Aeternitate Mundi* which is traditionally attributed to the Jewish philosopher Philo of Alexandria (Dey, op. cit., pp. 8-11). Somewhat later the word seems to have been either borrowed or independently invented for the description of the transmigration of souls in those schools of Hellenic thought into which this doctrine entered (Dey, op. cit., pp. 13-24, 25, and 32). Thereafter the currency of the word spread from the metaphysical to the mundane sphere on the one hand and to the religious sphere on the other. In the mundane sphere *παλιγγενεσία* had made its way, by the last century B.C., into the non-technical vocabulary of cultivated circles, and in this environment at this time it was used in a variety of contexts which provide us with our earliest extant historical evidence for its employment (see Dey, op. cit., pp. 25-30 and 32-3). For example, Josephus uses it (in *The Antiquities of the Jewish People*, Book XI, sec. 3, chap. 9, § 66) in the sense of a political *risorgimento* (the return to Judaea from the Babylonish Captivity), and Cicero (*Ad Atticum*, vi. 6) in the sense of a personal reinstatement into a temporarily forfeited political position (Cicero's amnesty and return from banishment). In the religious sphere, outside the Christian field, the only worship in which the presence of the concept of *παλιγγενεσία* can be traced with any certainty are the Hermetic variety of Gnosticism, the so-called 'Mithras Liturgy', and the personal religion of Philo of Alexandria, in so far as this can be reconstructed from his surviving literary works (Dey, op. cit., pp. 36-128 and 132). In the Epistle to Titus the word *παλιγγενεσία* is used to describe the spiritual effect, upon the Soul, of the Christian rite of Baptism; in the Gospel according to Saint Matthew it is used to describe the social effect of the inauguration of the Kingdom of the Messiah.

The literal meaning of 'palingenesia' is 'a recurrence of birth' or, more vaguely, 'a recurrence of coming into existence' (Dey, op. cit., pp. 23 and 33); and in either variant of this meaning there is an element of ambiguity; for the recurrence might refer exclusively to the event of birth (or of coming into existence) or alternatively its reference might extend to the nature of the thing born (or brought into existence); and while in the latter use the word 'palingenesia' would mean a repetitive re-birth of something that has been born before, in the former use it would mean an unprecedented new birth of something that is now being born for the first time. The Stoic and Orphico-Pythagorean origins of the term indicate (see Dey, op. cit., pp. 7, 23-4, 33, and 125) that, as a matter of history, the use of the word in the sense of 'repetitive re-birth' was the original one. For an application of it in the other possible use, in which it figures in the New Testament, see V. C (i) (e), vol. vi, pp. 169-75, below.

Schism-and-Palingenesia as one version of the generic double movement of Withdrawal-and-Return.¹

Schism-and-Palingenesia certainly runs true to the type of Withdrawal-and-Return in so far as the second beat of the movement is the significant feature in it. The happiness of the palingenesia is not only a reparation for the foregoing agony of the schism; it is also the point of the schism, or, in frankly teleological language, its purpose. And in fact we find that, when once the schism has occurred, nothing but frustration results from a closing of the breach before the due palingenesia has been accomplished. A case in point is the 'union sacrée' between the dominant minority of the Egyptiac Society and its internal proletariat against the external proletariat as represented by the Hyksos;² for it was this reconciliation at the eleventh hour that prolonged the existence of the Egyptiac Society—in a petrified state of life-in-death³—for two thousand years beyond the date when the process of disintegration would otherwise have reached its natural term in dissolution. And this life-in-death was not merely an unprofitable burden to the moribund Egyptiac Society itself: it was also a fatal blight upon the growth of the living Osirian Church⁴ which had been created by the Egyptiac internal proletariat; for the 'union sacrée' between internal proletariat and dominant minority took the form of an amalgamation of the living worship of Osiris with the dead worship of the official Egyptiac Pantheon; and this artificial act of syncretism killed the religion of the internal

¹ For this movement of Withdrawal-and-Return see III. C (ii) (b), in vol. iii, above.

² For this Egyptiac 'union sacrée' and its historical consequences see I. C (ii), vol. i, pp. 144-6, and Part V. A, pp. 2-3, with the references on p. 2, footnote 1, above.

³ For this phenomenon of petrification see Part V. A, above.

⁴ The word 'church' is used here, and throughout this Study, to mean no more than the collectivity of the devotees of a certain worship. A collectivity of this kind may be united solely by the inward-spiritual bond of their common worship of the same divinity, or alternatively this inward unity may find an outward expression in some kind of social organization. The classic example of an organized church is, of course, the Primitive Christian Church; and this feature of the life of the original Christian community has been preserved not only in the Western Catholic Church but also, on a smaller scale and on a looser rein, in many of the other branches into which the Christian Church has ramified in the course of its history. Another example of a highly organized church is the Egyptiac Church which was established, under the presidency of the Chief Priest of Amon-Re of Thebes, by the Pharaoh Thothmes III in the restoration period of Egyptiac history, after the expulsion of the Hyksos (see I. C (ii), vol. ii, p. 145, footnote 5, and IV. C (iii) (c) 2 (β), vol. iv, p. 421, above, and V. C (i) (d) 6 (δ), in the present volume, p. 530, and V. C (i) (d) 6 (δ), Annex, pp. 653-4 and 695, below). On the other hand the Osirian Church (see V. C (i) (c) 2, pp. 150-2, below), its offshoot the Isiac Church in the post-Alexandrine Hellenic World (see V. C (i) (c) 2, p. 81, below), and likewise the Orphic Church (see I. C (i) (b), vol. i, pp. 95-100, above, and V. C (i) (c) 2, in the present volume, pp. 84-7, below), are examples of churches of the unorganized kind. For the distinction between these two types of church see further, for the Isiac Church, Nock, A. D.: *Conversion* (Oxford 1933, Clarendon Press), pp. 135-6 and 147; for the Orphic Church, Boulanger, A.: *Orphée* (Paris 1925, Rieder), p. 50, and Fracassini, U.: *Il Misticismo Greco e il Cristianesimo* (Città di Castello 1922, 'Il Solco'), pp. 83-5. The structure of the Orphic and Isiac churches was 'congregational' rather than 'hierarchical'.

proletariat without availing to bring the religion of the dominant minority back to life.

The unfortunate outcome of this Egyptian 'union sacrée' suggests that this exceptional sequel to a social schism is one of those exceptions that prove a rule; and we may take the broken rule to be that a new birth, rather than a healing of the breach, is the one possible happy ending of a schism, besides being the normal ending of this particular variation on the movement of Withdrawal-and-Return.

We shall hardly be permitted, however, to take our interpretation of Schism-and-Palingenesia in terms of Withdrawal-and-Return for granted without being challenged to account for one feature in Schism-and-Palingenesia which, at first sight, might look as though it were quite incompatible with the nature of Withdrawal-and-Return as this is displayed in the process of growth. We have seen that civilizations owe their growth to the withdrawal and return of a minority—the Creative Minority which withdraws in order to find a response to some challenge that is confronting the whole society, and then returns in order to persuade an uncreative majority to follow it along the path which it has opened up. On the other hand, in the movement of Schism-and-Palingenesia that manifests itself in the process of disintegration, it would seem, at first sight, to be a majority that withdraws in the Secession of the Proletariat, while a minority—the Dominant Minority—now remains stolidly stationary. Is not this an exact inversion of the minority's and the majority's respective roles? And does not this mean that, after all, the movement of Schism-and-Palingenesia is of a different order from the movement of Withdrawal-and-Return, instead of being—as we had thought—a variation upon a theme with which we are already familiar?

Our best approach to this question will be to consider one difference, of which we have not yet taken note, between the Dominant Minority in a disintegrating civilization and the Creative Minority to which a growing civilization owes its growth.

In the succession of victorious responses to challenges in which the process of growth consists, the Creative Minority to whose enterprise and energy and resoluteness the victory is due is apt to be recruited from different individuals, with different social heritages and different ideas and ideals, at each successive performance of the drama.¹ This is the rule in a growing society even where the powers of government, in the widest sense of the word,

¹ This point has been touched upon, by anticipation, in III. C (ii) (b), vol. iii, p. 375, footnote 1, above.

are the hereditary monopoly of a close aristocracy of birth;¹ for in such circumstances the rule operates within these social limits no less surely than it operates throughout the society in cases where the whole of the society is enfranchised. In an aristocratically governed society that is in process of growth, we find one group of aristocratic families playing the part of Creative Minority in response to one challenge, and a different group in response to the next; and, if eventually the society is confronted with some challenge which is not successfully met by any group at all within the closed aristocratic circle, the aristocracy's failure does not necessarily bring the society's growth to an end; for the new challenge may still evoke a victoriously creative response from some minority in a stratum of the society that has hitherto been given no opportunity of playing a leading part in the society's affairs; and thus the series of challenges and responses, as it lengthens, may give occasion for the enfranchisement of one social stratum after another. In the history of the Hellenic Society, for example, we have seen how the old agrarian aristocracy was eventually worsted by the Malthusian problem when this was presented in a new form in the sixth century B.C. owing to the success of hostile neighbours in bringing the sheer extensive expansion of the Hellenic Society to a halt; and in the case of Attica (for which our historical record of this age happens to be less meagre than it is for other parts of Hellas) we have observed how the problem was solved nevertheless by the new-fangled class of merchants which made its appearance at Athens in the person of Solon, and how the consequences of the Solonian 'bourgeois' revolution led on in time to the enfranchisement of a new urban working class, side by side with the new urban bourgeoisie.² In the history of our own Western Society, in the so-called 'medieval' chapter of its growth, we can see another instance of the rise of successive creative minorities, outside the circle of a hereditary aristocracy, in the enfranchisement first of a bourgeoisie, and then of an urban working class, in the bodies politic of the North Italian city-states.

This tendency in a growing society for the Creative Minority to be recruited on each successive occasion from a new source can be accounted for by the combined operation of two distinct causes, one positive and the other negative. The positive cause is to be found in a fact which has already come to our notice.³ A con-

¹ The nature of the 'horizontal' lines of social cleavage in growing societies has been touched upon already in V. C (i) (a), p. 18, footnote 1, above.

² For the Attic version of this particular performance of the drama of Challenge-and-Response in the history of the Hellenic Society see I. B (ii), vol. i, pp. 24-5; II. D (ii), vol. ii, pp. 37-42; Part III. B, vol. iii, p. 122; III. C (i) (a), vol. iii, pp. 139-40; III. C (i) (d), vol. iii, p. 197; III. C (ii) (b), vol. iii, p. 273, above.

³ In Part V. B, above.

tinuance of growth implies that, in each successive round of Challenge-and-Response, the challenge which is presented is a new one (since *ex hypothesi*, if growth is still being maintained, the last challenge has been victoriously met and, in being met, has been disposed of). But if the challenge, each time, is new, it is only to be expected that this new challenge will be met, each time, by a newly recruited minority which can bring some hitherto unutilized talent into play in wrestling with a hitherto unfamiliar problem. The tendency for a new creative minority to be called up, in each successive emergency, by the operation of this positive factor will be accentuated by the effect of a negative factor which we have found to be a potent cause of the breakdowns of civilizations. We have seen in that context¹ that the gift of creativity is subject to its own peculiar nemesis; and that a minority which has demonstrated its creative power by responding to one challenge victoriously is likely to inhibit itself from repeating its exploit—that is to say, from responding, later on, to a different challenge with equal success—by succumbing to one or other of the two diverse temptations with which every successful creative minority or individual is beset: the temptation to rest on one's oars and the antithetical temptation to kick over the traces and run amok.

For this combination of reasons the Creative Minority in a growing society is apt to be perpetually changing—and this not simply in its personnel, but more profoundly, by far, in its ideas and its ideals. By contrast, the Dominant Minority in a disintegrating society tends to degenerate into a close corporation whose ideas and ideals have the legendary rigidity of the unchanging 'laws of the Medes and Persians'—and this even when its personnel is radically re-cast through the admission of *novi homines* to some share in the corporation's jealously guarded privileges.²

¹ In IV. C (iii) (c), vol. iv, above.

² The personnel of the Dominant Minority does frequently change almost completely in its physical composition in the course of the Dominant Minority's career between the original breakdown and the final dissolution of the disintegrating society; for the Dominant Minority is violently self-destructive, and it would be likely to annihilate itself long before it had come to the end of its brief turn on the stage if its strength were not perpetually recruited by infusions of fresh blood. The Dominant Minority does its best—or worst—to destroy itself by indulging in dissensions in its own ranks in the midst of its truceless warfare with the Proletariat. Its members exterminate one another in civil wars within the bosom of a single commonwealth as well as in wars between state and state; and at the same time they sap their own vitality by running to extremes of luxuriousness and vice and of sluggishness and frenzy. The new blood—'*viscera magnarum domum dominique futuri*' (Juvenal: *Satires*, III, l. 72; quoted again in V. C (i) (c) 2, p. 67, below)—which keeps the Dominant Minority alive is drawn in ever larger draughts from ever more alien sources. For example, the Roman senatorial class which represented the dominant minority of the Hellenic Society in the penultimate phase of its disintegration—between the convulsions in the third century of the Christian Era and the death-throes in the fifth and sixth centuries—would perhaps not have been able to trace more than a tincture in its blood back to the veins of the Roman senatorial class of the Republican Era, with which it was officially identical. The families which were the representatives

This social and mental and spiritual fixity that is characteristic of dominant minorities, in contrast to creative minorities, and that persists through one round after another of the series of unsuccessful responses that constitutes the disintegration-process, can be accounted for by the fact that in the disintegration of a civilization, in contrast to its growth, the challenge that is presented in each successive bout of Challenge-and-Response is always, now, the same.¹ The unanswered challenge recurs again and again, and the discomfited minority keeps the field in order to invite and incur as many successive defeats at the hands of an adversary whom it can neither overcome nor elude. The discomfiture, each time, is a foregone conclusion, since the minority which has become merely dominant has ceased, *ex hypothesi*, to be creative. The defensive posture which it substitutes for a creative activity may be either indolent or recalcitrant; but, whether it is insanely defying the lightning or inertly resting on its oars, in either posture the Dominant Minority is refusing to hand over to other aspirants the protagonist's role which it has already proved itself incompetent to play.

These postures that remain rigidly the same, through one bout after another of a losing battle, are the marks of the Dominant Minority in a disintegrating civilization. The contrast to the fluidity and versatility of the successive creative minorities in a growing civilization is extreme. The creative minorities are in perpetual flux because they are successive incarnations of the diverse forms in which the creative spirit manifests itself in response to challenges which are never the same twice running. The Dominant Minority stands stiff, like the pillar of salt into which Lot's wife was transformed as the penalty for looking back upon the abandoned Cities of the Plain instead of turning her face

of this class at the turn of the fourth and fifth centuries of the Christian Era were probably descended in the physical sense almost entirely from *ci-devant* members of the internal and external proletariats; from Orientals and barbarians who had acquired the Roman citizenship, or even from slaves who had purchased their freedom. Indeed, in terms of 'Race' there was almost certainly a much greater infusion of new blood into the Roman senatorial class in its decadence as a dominant minority than the aristocracies of the Roman Republic or the Macedonian Kingdom or the Athenian City-State had ever received in their prime when they were still furnishing creative minorities for a growing civilization. In physical race it is the Creative Minority of the springtime, rather than the Dominant Minority of the decadence, that is able to boast of its 'purity'. At first sight this will seem paradoxical; but on a closer view it will be seen to confirm our previous conclusion (reached in II. C (ii) (a) 1, vol. i, above) that Race counts for very little in human affairs. The telling factors are the ideas and the ideals. The Dominant Minority remains, from first to last, the rigid and static corporation that we have described, because the *novi homines* who change its racial composition are only allowed to bring in their new blood on condition of accepting the old tradition of the body into which they are being initiated. Conversely, an aristocracy in a society in the growth-stage may keep itself racially 'pure' without ceasing to throw up one creative minority after another so long as its members forbear to steel their souls against the influence of the spirit that bloweth where it listeth.

¹ On this point see Part V. B, above.

resolutely towards the mountain in which she might have found a happier habitation.

In so far as it takes this stand, the Dominant Minority condemns itself, in advance, to have no further part or lot in the work of creation; but in making its 'great refusal' it impoverishes no one but itself. By disqualifying itself from serving as an instrument, it does not bring the work to an end; for, while this civilization is falling and that civilization is rising, the work of creation still goes on. It not only goes on; it also continues to be performed through that action of Challenge-and-Response and Withdrawal-and-Return with which we have become familiar in our analysis of the process of growth. When the growth of a civilization is cut short by a breakdown, and the would-be creative minority that has stiffened into a dominant minority begins to repeat an ineffective gesture which never varies at each onset of an unanswered challenge which never ceases to recur, this monotonous celebration of the tragedy of defeat is not the only drama that is played upon the broken-down civilization's social stage. During the disintegration of a civilization two separate plays with different plots are being performed simultaneously side by side. While an unchanging dominant minority is perpetually rehearsing its own defeat, fresh challenges are perpetually evoking fresh creative responses from newly recruited minorities which proclaim their own creative power by rising, each time, to the occasion.

These ever-changing new creative minorities stand in no fixed relation to the Dominant Minority which persists in holding the floor side by side with them for as long as it retains the strength to remain upon its feet. They are not bound *a priori* to be recruited entirely outside its ranks,¹ any more than they are bound to coincide with the Dominant Minority in their membership, either wholly or in part. Manifestly the chances are in favour of their being recruited from among outsiders, since *ex hypothesi* the Dominant Minority has placed itself in a rigid posture which is inimical to creativity; yet the creative spirit does not wholly depart from the souls of the Dominant Minority before it has performed through them at least two mighty works: the creation of a school of philosophy which prepares the way for a universal church—filling some of the valleys and bringing some of the mountains low² in the spiritual wilderness of a society in disintegration—and the creation of a universal state as a material framework within which a universal church can flower in its tender infancy. Both these

¹ For the recruitment of leaders of the Internal Proletariat from the ranks of the Dominant Minority see V. C (ii) (a), vol. vi, pp. 236-41, below.

² Luke iii. 4-5.

things are the work of creative minorities and creative individuals who arise among the members of the Dominant Minority; but at the same time they are only a part of the work of creation that is being accomplished during the age of disintegration in the disintegrating society's ambit; for at the same time another creative minority's handiwork can be discerned in the creation of a universal church, and another's, again, in the creation of a bevy of barbarian war-bands.

We have now found our answer to the question whether the movement of Schism-and-Palingenesia, as we see it in the process of disintegration, does not differ from the movement of Withdrawal-and-Return, as we have seen this in the process of growth, in the point that in Schism-and-Palingenesia it is a majority that withdraws from a minority. We can see now that the answer to our question is, after all, in the negative. In Schism-and-Palingenesia it is still a minority that withdraws—and this, as before, for the purpose of finding a creative response to a challenge. But in a disintegrating civilization the uncreative mass, from which the Creative Minority distinguishes itself, is differently constituted from the uncreative mass of a civilization that is still in growth. Instead of consisting wholly of an impressionable rank-and-file whom the Creative Minority, when it returns, can induce to follow its lead by playing upon the faculty of mimesis, the uncreative mass now also consists in part of a Dominant Minority which is almost entirely intractable to the new creative minority's influence. What we are watching in the Secession of the Proletariat is thus not really the withdrawal of a majority from a minority. It is the performance of the Creative Minority's familiar work in the familiar way, but in the teeth of another minority of a different order—a recalcitrant minority which is persisting in a hopeless attempt to dominate a situation in which it does not any longer command the initiative. The secession which is thus accomplished by a creative minority under these special difficulties only appears to be the work of a majority because the Creative Minority attracts to itself, as usual, the mimesis of the uncreative mass apart from the fraction of this mass which is now stubbornly resisting this attraction because it has cast itself for the Dominant Minority's role. As usual, 'the floating vote' is given to the Creative Minority every time, while the Dominant Minority attracts no mimesis to itself and can do no more than withhold its own support from its creative rival. It is only this negative power of making 'the great refusal' that distinguishes the Dominant Minority from the rest of the uncreative mass;¹ and this distinction is not fundamental. The

¹ A classic illustration of this is afforded by the contrast between the status and the

most significant, though not the most conspicuous, line of division is still that which divides the whole of the uncreative mass from the Creative Minority in each successive round of Challenge-and-Response.

That the Secession of the Proletariat should thus prove, after all, to be the work of a minority and not of a majority is only what we might have expected. For an act of secession is manifestly an act that requires the exercise of initiative and courage and imagination in a high degree; and these are not the virtues of sheep without a shepherd. This point is illustrated by the historic 'Secessions of the Plebs' in the history of the Roman Republic—in allusion to which our own term 'Secession of the Proletariat' has been coined. It is notorious that in the earlier bouts of the conflict between Plebeians and Patricians the Plebs strove in vain to break its economic and political chains. It was only gradually that the challenge of oppression evoked the latent powers of leadership in a minority of the Plebeian mass; and it was this creative minority—an inchoate 'Plebeian aristocracy', to describe it through a contradiction in terms—that conceived and executed the plan of secession as a stratagem for bringing the oppressive Patricians to their knees. If this minority had not taken the lead, the rank-and-file of the Plebeians would assuredly never have struck out for themselves the master-stroke of first escaping from the pen in which their oppressors fancied that they held them corralled, and then turning at bay in the security of the open wilderness.

(c) SCHISM IN THE BODY SOCIAL

I. *Dominant Minorities*

Our preliminary inquiry into the movement of Schism-and-Palingenesia has incidentally brought out the fact that no one of the several fractions into which a disintegrating society is apt to split—neither the Dominant Minority nor the Proletariat, Internal or External—is all of one homogeneous *êthos* in the spirit that animates its members.

We can now see that there is an element of variety even in the Dominant Minority, notwithstanding the fact that a certain fixity and uniformity of *êthos* is this Dominant Minority's characteristic mark. The Dominant Minority may perform prodigies of sterilization in converting to its own barren *esprit de corps* the *novi homines* whom it is continually drafting into its repeatedly self-decimated

state of mind of the French *noblesse* on the eve of the Revolution (see the quotation from de Tocqueville in IV. C (iii) (c) 2 (γ), Annex, vol. iv, p. 638, footnote 6, above). In the France of that generation the aristocracy had stamped itself unmistakably as a dominant minority, whereas in the England of the same generation the aristocracy had not yet ceased to be creative.

ranks; yet, for all its perversity, it cannot prevent itself from putting forth the creative power and activity that are revealed in the creation of a universal state and of a school of philosophy. And accordingly we find that even the Dominant Minority is apt to include a certain number of members who depart very strikingly from the characteristic type of the closed corporation to which they belong.

In the Dominant Minority this characteristic type displays two variants—one passive and the other active—which have both come to our notice already in an extreme form in our study of the arrested civilizations.¹ The passive variant resembles the Nomad who has conquered a sedentary population and who is ruthlessly exploiting his conquest in a *Raubwirtschaft* which is as reckless, and therefore as self-destructive, as it is immoral. The active variant resembles the 'Osmanli or the Spartiate who takes sufficient thought for the morrow to forgo the immediate delight of enjoying what he has won, in order to dedicate himself to the grim task of holding his prize by main force. In the dominant minority of the Hellenic Society in disintegration the nearest approach to the Avar or the Hyksos in *partibus agricolarum* is to be seen in the Roman knighted man of business (*vir equestris*) who fleeced the conquered populations in the second and the last century B.C. by farming the collection, or financing the payment, of their taxes; or in the Roman aristocrat (*vir senatorius*) who, according to his opportunities, played ducks and drakes with the wealth and happiness of a province as a Verres or of a continent as a Lucullus or of a world as a Nero. The nearest approach, in the same social milieu, to a Spartiate 'Peer' or to an Ottoman *qul* is to be seen in a Rupilius stamping out the embers of the Sicilian slave-revolt of 135-131 B.C.;² or in a Crassus planting an avenue of agony—six thousand crosses with a captured follower of the insurgent gladiator Spartacus nailed alive on each—along the whole length of the Great

¹ In Part III. A, vol. iii, above.

² In justice to the Roman name it should be mentioned that in this first of the two Sicilian slave-wars neither Rupilius nor any other Roman was the villain of the piece. The monster who provoked the outbreak was not a Roman citizen but a native Sicilian slave-owner, Dāmophilus of Enna, whose home city-state was politically a subject community. (For a vivid picture of Dāmophilus see Diodorus of Agyrium: *A Library of Universal History*, fragments of Books XXXIV-XXXV, chap. 2, §§ 34-7, quoted in V. C (i) (c) 2, p. 72, footnote 2, below.) The role here played by Dāmophilus points the fact that the criterion of membership in the Hellenic dominant minority, in the sense in which we are using the term, was not political citizenship but social class and, above all, economic 'pull'. This dominant minority included many oppressors who did not possess the Roman franchise; and conversely there were many Roman citizens in Dāmophilus's generation (e.g. the common soldiers in the Roman forces that put down the slave-revolt which Dāmophilus had provoked) who had sunk into being members of the proletariat—as is testified by the words and deeds of Tiberius Gracchus. (For the saying attributed to Tiberius Gracchus see IV. C (iii) (c) 3 (β), vol. iv, p. 508, above, and V. C (i) (c) 2, pp. 70-1, and V. C (ii) (a), Annex II, vol. vi, p. 381, with Table VIII, logion (α), p. 414, below.)

South Road from Rome to Capua;¹ or in a Titus sowing the site of Jerusalem with salt.

This pair of types—the wastrel and the hangman^a—that are characteristic of the members of a dominant minority in power, has its necessary historical complement in a third type which must evidently have been on the scene in a previous act of the play: and that is the conqueror who has originally won the loot which the hangman is trying to guard and the wastrel is trying to dissipate. This third type, again, can be illustrated by conspicuous examples from Hellenic history. In the disintegration of the Hellenic Civilization the conqueror can first be seen at work in those internecine wars between sovereign states which raged with ever greater violence until the Roman ‘knock-out blow’ imposed a peace of exhaustion. This conqueror in the fratricidal warfare within the bosom of the Dominant Minority was incarnate in a Philip selling the Olynthians into slavery; in an Alexander crushing Thebes; in a Mummius razing Corinth; in a Sulla devastating Samnium;² and in the successive victor-victims of a century of Roman civil wars in which the last round ended in the overthrow of Mark Antony by Augustus. In another field we see the conqueror turning these arms that have been exercised in fratricidal warfare to the conquest of aliens:³ both alien civilizations and alien primitive societies. The outstanding Hellenic example of the conqueror of alien civilizations is Alexander the Great (though his greatness lies, as we shall see,⁴ in a vision of unity through reconciliation which is seldom granted to those who draw the sword to cut the Gordian Knot). The Hellenic conquerors of primitive societies are represented by the long series of consuls and pro-consuls who imposed the Roman yoke upon the necks of all the barbarians of Western Europe and North-West Africa from the Ligurians in the Appennines to the Brigantes in the Plain of York, and from the Kabyles in the Aures to the Dacians in Transylvania: a Publius Cornelius Scipio rewarding the Boii for laying down their arms in 191 B.C. by confiscating half their land to provide allotments for Roman colonists;⁵ a Marcus Claudius Marcellus expelling the peaceful Gallic settlers from Venetia in 183 B.C.;⁶ a Publius Cornelius Cethegus and a Marcus Baebius Tamphilus deporting 40,000

120.

² Strabo: *Geographica*, Book V, chap. 11, pp. 249–50, cited already in IV. C (iii) (c) 2 (β), vol. iv, p. 391, above.

³ For this explanation (so far as it goes) of the geographical expansion of disintegrating civilizations see III. C (i) (a), vol. iii, p. 150, and V. C (i) (a), in the present volume, pp. 15–16, above.

⁴ In V. C (i) (d) 7, vol. vi, pp. 6–10, and V. C (ii) (a), vol. vi, p. 254, below.

⁵ Livy, Book XXXVI, chap. 39.

⁶ Idem, Book XXXIX, chap. 54.

Apuani from the Appennines to the Abruzzi in 180 B.C.;¹ a Quintus Petillius Spurius annihilating in 176 B.C. the desperate defenders of Mounts Letus and Balista;² a Marius leading a Jugurtha in chains; a Caesar mastering a Vercingetorix.

The sheer conqueror is an even more destructive and repellent representative of the Dominant Minority than the wastrel and the hangman who enter into his heritage; yet these are not the only three types that the Hellenic dominant minority has to show. This close corporation which disgraced itself by producing the Roman conquerors and wastrels and hangmen lived on to become the fertile recruiting-ground of those innumerable and mostly anonymous Roman soldiers and civil servants who partly atoned for the misdeeds of their predatory equestrian and senatorial predecessors by creating and preserving the Hellenic universal state and so making it possible for a moribund society to bask for a moment in the clear pale sunshine of an 'Indian Summer'.³ These later and nobler representatives of the Hellenic dominant minority are to be seen at their fine flower, on the eve of the first sharp winter frost, in the figures of an Arrian and a Pertinax and a Dio Cassius,⁴ while the moral power of the altruistic tradition of social

¹ Livy, Book XL, chap. 38. Later in the same year 7,000 more Apuani were deported to the Abruzzi—in this case by sea—by Quintus Fulvius Flaccus (*idem*, Book XL, chap. 41).

² *Idem*, Book XLI, chap. 18.

³ See IV. C (ii) (b) 1, vol. iv, pp. 58-61, above.

⁴ While some of the most gifted natures and attractive personalities in the goodly company of Roman Imperial public servants are to be found among its representatives at the turn of the second and third centuries of the Christian Era—more than two hundred years after the organization of the service by Augustus—it is noteworthy that the sense of moral responsibility to which Augustus gave a classic institutional expression can be traced back among the Roman governing class to the dark days of the first generation after the Hannibalic War. In the dealings of the Roman Government with the primitive peoples in its path the victory of the policy of humanity over the policy of extermination was won as early as 173-172 B.C. (see V. C (i) (c) 1, Annex, below). The record of Roman dealings with communities which were Rome's equals or superiors in cultivation is much blacker; yet the prosecution and conviction of Verres in 70 B.C., which was made immortal by Cicero's oratory, had been anticipated, by more than a hundred years, in the proceedings which were taken against Marcus Fulvius Nobilior, one of the consuls of 189 B.C., for his treatment of the Greek city-state of Ambracia during his year of office. The story is told by Livy (Book XXXVIII, chaps. 3-9, 43-4; Book XXXIX, chaps. 4-5, 22). Ambracia, being an ally of the Aetolian Confederacy, with which Rome was at war, stood a siege from Fulvius's army but capitulated unconditionally, before being taken by storm, when the Aetolian Government opened negotiations for peace. Thereupon the Ambraciots 'gave' the consul a gold crown of 150 pounds' weight, and the city was stripped by him of all the works of art—bronzes, marbles, and canvases (*Hellenic* 'boards')—for which it was famous. Two years later an Ambraciot deputation appeared before the Roman Senate and accused Fulvius of having perpetrated against their city an enormity which was indisputably perpetrated against the Ligurian Statelli in 173 B.C. by Marcus Popillius Laenas. The Ambraciots declared that the Roman commander had made an unprovoked attack on them when they were showing themselves entirely amenable to the Roman Government's will, and that he had then despoiled them as a punishment for the crime of having exercised the right of self-defence. In response to this plea the Senate resolved that restitution should be made to the Ambraciots of their political and economic sovereignty as well as of their confiscated property, and that Ambracia should not be treated as a city that had been taken by storm (a merciful ruling, since, according to Roman customary law, a conquered community was condemned in perpetuity to put up with a much worse status

duty which this long line of great public servants had marvellously built up out of a poisonous heritage of moral nihilism is to be seen at its strongest in its hold upon natures which were intrinsically violent and self-seeking. One of the most impressive surviving testimonies to the spirit with which the public servants of the Hellenic universal state were imbued is to be found in the last words which are attributed to the Emperor Lucius Septimius Severus.¹

Moreover the Roman public servant is neither the only nor the earliest epiphany of the Hellenic dominant minority in an altruistic role. In the age of the Severi, when the reign of the Stoic Emperor Marcus was an accomplished fact of Roman history, and when a school of Stoic jurists was translating the Stoic *êthos* into terms of Roman Law, it was manifest that the miracle of converting the Roman wolf into a Platonic watch-dog had been the work of Greek philosophy. The high-minded philosopher thus reveals himself as another altruistic representative of the Hellenic dominant minority whose existence and influence are attested and presupposed by the eventual emergence of the dutiful public servant. If the Roman administrator was an altruistic agent of the Hellenic dominant minority's practical ability, the Greek philosopher was a still nobler exponent of its intellectual power; and the golden chain of creative Greek philosophers, which ends with Plotinus (*vivebat circa* A.D. 203-62) in the generation that lived to see the Roman public service collapse, had begun with Socrates (*vivebat circa* 470-399 B.C.) in a generation that was already grown up in 431 B.C., when the Hellenic Civilization broke down.² To retrieve, or at any rate to mitigate, the tragic consequences of that breakdown was the Greek philosopher's, as well as the Roman administrator's, life-work; and the philosopher's labours produced

than that of a community which had accepted Rome's political supremacy by treaty). This was a notable judgement; but the outcome was more dubious, and the precedent created was therefore less effective, than in the parallel case of Popilius. On the one hand the Senate's action against Fulvius seems to have been determined not only by the merits of the case but also in part by the intervention of one of the consuls of the year who was moved by personal motives. On the other hand the moral effect of the judgement was partly undone by the Senate's subsequent action in allowing Fulvius (though this only after a hot debate) to celebrate a triumph in which the stolen works of art from Ambracia figured among the paraded spoils, and to follow this up by spending a considerable part of the gold which he had extorted from the Ambraciots on an elaborate show for the entertainment of the Roman proletariat.

¹ 'Ultima verba eius dicuntur haec fuisse: "Turbatam rem publicam ubique accepi, pacatam etiam Britannis relinquo, senex ac pedibus aeger firmum imperium Antoninis meis relinquens ac boni erunt, imbecillum si mali." iussit deinde signum tribuno dari "Laboremus", quia Pertinax, quando in imperium adscitus est, signum dederat "Militemus".'—'Severus', chap. 23, in the so-called *Historia Augusta*. These words, if authentic, were uttered by Severus at York, within sixteen miles of the place where these lines were being written.

² Greek philosophy may be said to have been born in the hour in which Socrates abandoned his youthful studies of Physical Science in order to concentrate his mind upon the Soul (see the passage from Plato's *Phaedo*, 96-7, which has been quoted in III. C (i) (c), vol. iii, pp. 186-7, above).

a more valuable and more durable result than the administrator's, just because they were less closely woven into the material texture of the disintegrating society's life. While the Roman administrators built a Hellenic universal state, the philosophers endowed Posterity with a *κτῆμα εἰς αἰεί*¹ in the Academy and the Peripatus, the Stoa and the Garden, the Cynic's freedom of the highways and hedges, and the Neoplatonist's unearthly Land of Heart's Desire.

If we now extend our survey from the field of Hellenic history to the histories of other civilizations that have broken down and gone into disintegration, we shall find that the noble streak of altruism which relieves the sombre record of the Hellenic dominant minority is not a peculiar grace of the Hellenic Civilization. The types that we have now identified in the dominant minority of the Hellenic Society in disintegration all reappear elsewhere.

If we look for wastrels to match the Roman plunderers of a conquered Hellenic World in the age preceding the establishment of the *Pax Augusta*, we shall find them in the war-lords, lay and ecclesiastic, who ground the faces of the Japanese peasantry in the age preceding the foundation of the Tokugawa Shogunate. We shall find their like again, in the Arabic World, in the Mamlûks who ground the faces of the Egyptian peasantry more outrageously in their military decadence than in an earlier age when they were performing a certain public service in return for their feudal dues.² And our own Western history in its latter days furnishes a long gallery of portraits which are unmistakable examples of the same type: from the flauntingly predatory princes of the sixteenth and seventeenth centuries—a Rodolfo Gonzaga of Castiglione and a Henry VIII of England and a Louis XIV of France—who had shaken off the moral discipline of the medieval Church,³ to the more discreetly predatory plutocrats of the nineteenth and twentieth centuries, who have put the princes in irons in order to usurp for their own bourgeois profit the adventurer's self-conferred privilege of playing the game of *Raubwirtschaft* with the whole World for their oyster.

Similarly, if we look for hangmen to match a Crassus and a Titus, we shall find them in the Assyrian war-lords, from Tiglath-Pileser III to Asshurbanipal, as they wrestle ever more savagely with their self-imposed *tour de force* of holding down a conquered

¹ Thucydides, Book I, chap. 22.

² For the Egyptian Mamlûks see Part III. A, vol. iii, pp. 30-1; and IV. C (iii) (c) 3 (α), vol. iv, pp. 447-61, above.

³ For the revolt of the local secular princes against the moral authority of the Catholic Church in the Western World at the beginning of the Modern Age, and for the princes' seizure and exploitation of the instruments and methods of public administration which the Papal Curia had invented, see IV. C (iii) (c) 3 (β), vol. iv, pp. 534-5 and 539-40, above.

Syria with one hand and a conquered Babylonia with the other, with no hand left free for retaining their hold upon Egypt.¹ We shall find other representatives of the hangman type in the Tsars—an Ivan the Terrible and a Peter the Great and a Nicholas I—who have had recourse to all the weapons in the armoury of political repression in order to keep the yoke of a universal state upon the shoulders of a restive nobility and a ground-down peasantry and a thwarted intelligentsia. And the hangman type, like the wastrel type, presents itself in our own Western World as well. It is unmistakably represented by the sinister figures of sixteenth-century German princes hanging and burning alive their rebellious Anabaptist peasants² (with the approbation of a Martin Luther!). And the same type reappears as plainly in the figures of these princes' latter-day National-Socialist supplanters, who, at the moment when these words were being written, were attempting to break the spirit of Jews, Marxians, Liberals, Pacifists, Christians, and Prussian officers by employing our twentieth-century methods of barbarism in pursuit of a sixteenth-century aim. Nor is this savagery a mere local German departure from a milder Western norm; for the English observer, writing smugly in his study, will find his pen refusing to obey his fingers if he begins to thank God that he and his kinsfolk are not as men are on the Continent. If he is tempted to offer the Pharisee's thanksgiving, his conscience will rise up to remind him of the English-speaking peoples' responsibility for the crime of Negro Slavery,³ and of those English penal laws⁴—repealed scarcely a century ago—under which an English labourer convicted of a petty theft might be sentenced by an English magistrate to deportation for life if he were lucky enough to escape the gallows.

If we want an example of the wastrel and the hangman combined in one person, we shall find it in the Egyptian World in the Pyramid-Builder⁵ whose hold over his subject peasantry was so complete that he could wear them out for the gratification of his own megalomania without having to fear that his victims would rebel under the lash.

We can also add portraits from the histories of other disintegrating civilizations to our gallery of Hellenic conquerors.

The fratricidal warfare within the bosom of the dominant minority of the Hellenic Society which ended in the delivery of

a Roman 'knock-out blow' has its analogue in the Sinic World in the struggle between the contending states which ended in the triumph of Ts'in,¹ and in the Far Eastern Society in Japan in that Ishmaelitish warfare of all against all which required three successive Caesars—a Nobunaga and a Hideyoshi and an Ieyasu—to bring it to a close.² The disintegration of the Babylonian and Iranian civilizations was carried to its consummation by a duel between two sister Powers: Assyria and Babylonia in the one case,³ and the 'Osmanlis and the Safawis in the other.⁴ In Orthodox Christendom the duel between the East Roman Empire and Bulgaria in the tenth century of the Christian Era opened the way for the Frankish and Turkish inroads of the century following.⁵ And in the Syriac and Hindu worlds a similar orgy of fratricidal warfare likewise opened the way for the Assyrian inroads into Syria⁶ and for the Turkish inroads into Hindustan.⁷ In Central America the forcible incorporation of the Yucatec Society into the Mexic Society seems to have been one of the penalties of the fratricidal 'War of Mayapan' in which a Yucatec dominant minority had enlisted Mexic mercenaries to help it in the suicidal work of tearing itself to pieces;⁸ and it is certain that it was the war between the Aztecs and the Tlaxcalecs that afterwards condemned the Mexic Society itself to become the prey of the Spanish *conquistadores*.⁹

In the abortive cosmos of city-states which tried and failed, in the second chapter of our Western history, to convert a feudal society, within which it had arisen, to its own way of life, this failure can be traced everywhere—in Italy and in Flanders, in Swabia and in the Rhineland—to the internecine strife between the patriciates of one city-state and another.¹⁰ In consequence of this failure our Western Society discarded the city-state and fell back, as we have seen, upon the old-fashioned kingdom-state, with its feudal heritage, when it was groping after a new standard unit of parochial civic organization at the beginning of the third chapter of our Western history. And, when we remind ourselves of that curious check and throwback with which the political history of this third chapter began, we are led to ask ourselves whether by making this fresh start the princes and oligarchies and

democracies of our latter-day Western kingdom-states and national states have succeeded—while this third chapter in our Western history has been running its course and finally passing into a fourth¹—in avoiding the fratricidal warfare through which the fair promise of the medieval Western city-states was blighted, in an earlier chapter of the same story, by the perverse pugnacity of the city-state patriciates. Unhappily the answer to this fateful question is emphatically in the negative.²

As soon as the modern political map of our Western World began to take shape, the masters of the new-model states made haste to engage in fratricidal warfare on the larger scale which their ampler resources made possible for them. The contest for hegemony between the Hapsburgs and the Bourbons, which inaugurated the Modern Age of our Western history, has been followed by the wars of Philip II and the wars of Louis XIV and the Revolutionary and Napoleonic Wars of A.D. 1792-1815; our own 'Post-Modern' Age has been inaugurated by the General War of 1914-18; and every one of these major conflicts has brought with it a crop of minor wars—some preceding it as its overture, and others following it as its sequel.³ The life of our Western Society has been as grievously infested by the plague of War during these last four centuries as in any earlier age; and we have already observed⁴ how this social evil, in persisting, has been keyed up to an unprecedented intensity by a new 'drive' that has been put into it since the invention of Democracy and Industrialism, until the former 'sport of kings' has become the absorbing business of whole nations: *la Guerre Totale*. If a furore of fratricidal warfare within the bosom of a society is presumptive evidence that a dominant minority has come on to the scene, we must confess that, to judge by the recent course of our Western history, our Western Society, in its present fourth chapter, has arrived at the stage upon which the Hellenic Society entered after the opening of the third chapter of Hellenic history *post Alexandrum*.

Nor has the dominant minority of the disintegrating Hellenic Civilization been unique in begetting conquerors who turn their arms against aliens.

For example, there are other disintegrating civilizations, besides the Hellenic, that can show their Alexanders (though these non-

⁴ In IV. C (iii) (b) 3, vol. iv, above.

Hellenic Alexanders are apt to be mere men of blood unredeemed by the spiritual vision of Alexander the Great). The Sumeric Society can display a string of them: Lugalzaggisi, Sargon, Naramsin.¹ The Egyptiac Society can show the militarists of 'the New Empire'—a Thothmes I and a Thothmes III and a Ramses II—who conquered and re-conquered the domain of an abortive Syriac Civilization² from Gaza to the Euphrates. In the disintegration of the main body of the Orthodox Christian Society the 'Osmanlis had no sooner completed their work of establishing a universal state in which a *Pax Ottomanica* was imposed upon the whole of Orthodox Christendom apart from Russia³ than they sought new worlds to conquer, both east and west. Selīm I was consciously following in the footsteps of Alexander when he marched against the Persians; and, though his Janissaries insisted on turning back at Tabriz instead of allowing themselves to be led, like Alexander's Macedonians, to the banks of the Beas,⁴ Selim did successfully repeat Alexander's exploit of conquering Egypt;⁵ and his successor Suleymān the Magnificent attempted the superhuman feat of mastering the Safawī Empire with one hand and Western Christendom with the other. The disintegration of the Far Eastern Civilization in Japan produced a counterpart of Suleymān in Hideyoshi, who had scarcely completed Nobunaga's work in the Japanese Isles before he recklessly diverted an exhausted society's last energies to grandiose schemes of conquest on the Continent—only to be foiled in Korea without ever coming within range of China. The same megalomania was displayed by the Muscovite makers of the Orthodox Christian universal state in Russia when they attempted to expand their dominions simultaneously at the expense of Western Christendom in the Balticum and Finland and Poland and at the expense of the Iranic World in the Caucasus and Central Asia. This insatiable appetite for territory in potentates who are already gorged, and who cannot digest the resources of the vast tracts which they have inherited, is an example of that mania for sheer magnitude which we have already recognized⁶ as a pathological effort to find some alternative means of self-expression in lieu of a lost creative power. Again, the Iranic Society threw up, in the course of its disintegration, a Nādir Shāh⁷ (*dominabatur* A.D. 1736-47) whose career looks like nothing so

much as a caricature of Alexander's as we watch this parvenu Avshār soldier of fortune ramping up and down the famous Macedonian's historic South West Asian stage—now showing his flag for a moment at Baghdad, and now rushing off to plunder Delhi—until suddenly we see him, to our astonishment, being enlightened by a gleam of the genuine Alexandrine vision of reconciliation and unity, and courting—in his daring effort to bring back the Shi'ah to the Sunnah—the assassination that swiftly overtakes him.¹

These non-Hellenic counterparts of Alexander the Great can be matched by corresponding counterparts of the Roman conquerors of the West European and North-West African barbarians. There is a Roman touch in the conquest of Nubia by the Caesars of the Egyptiac universal state—an Amenemhat I (*imperabat circa* 2000–1971 B.C.) and a Senwosret III (*imperabat circa* 1887–1850 B.C.)²—and likewise in the conquest of Yunnan by the Mongol makers of the Far Eastern universal state in the main body of the Far Eastern Society on the Asiatic Continent, while in the insular offshoot of the Far Eastern Society in Japan the subjugation of the primitive Ainu in an age when the Japanese war-lords were strenuously engaged in rending one another³ is as astonishing a feat as the Roman subjugation of Gaul and Numidia in the age of the Roman civil wars.

If we turn in conclusion, as before, to the history of our own Western World in its Modern and its 'Post-Modern' Age, we shall find, here too, the counterparts of a Caesar in Gaul and a Marius in Numidia and an Alexander in Asia—and this in an arena that expands over the whole surface of the planet. Alexander's over-running of the Syriac and Egyptiac and Babylonian and Indic worlds of his day has been rivalled in the Spanish conquest of the Mexic and Andean worlds and the British conquest of the Hindu World and the Dutch conquest of Indonesia and the French conquest of the Maghrib. The Roman conquests of barbarians have been rivalled in the Portuguese colonization of Brazil, in the French and British colonization of North America between the Rio Grande and the Arctic Circle,⁴ and in the opening up of the

¹ See Browne, E. G.: *A Literary History of Persia*, vol. iv (Cambridge 1928, University Press), pp. 135–8, and Lockhart, L.: *Nadir Shah* (London 1938, Luzac).

² For this first Egyptiac conquest of Nubia by the Theban Emperors of the Eleventh and Twelfth Dynasties see II. D (v), vol. ii, p. 115, above. For the role played by the so-called 'Middle Empire' as an Egyptiac universal state see I. C (ii), vol. i, p. 137. Senwosret III has commemorated the hardness of his heart in the inscription on the frontier-stele which he erected at Samnah in the sixteenth year of his reign (English translation in Hall, H. R.: *The Ancient History of the Near East* (London 1913, Methuen), pp. 161–2).

³ See II. D (v), vol. ii, p. 159, above.

⁴ For the victory of the Western Civilization over the Mexic Civilization in the race for winning the prize of North America see II. C (ii) (a) 2, vol. i, p. 265, footnote 1, above.

whole interior of Tropical Africa, between the Kalahari Desert and the Sahara, by a simultaneous converging movement of French and Belgian and German and English and Afrikaner pioneers.

In sheer geographical range this Western expansion in the last four centuries dwarfs the combined achievements of the Romans and the Macedonians; but the Hellenic conquerors of alien worlds need not fear to measure themselves against their Western counterparts when the comparison is extended from the physical to the spiritual dimension. If the British Rāj in India has succeeded in becoming as humane as the Seleucid régime in Babylonia, on the other hand the Dutch rule in Java is infected with the same taint of commercial exploitation that blights the memory of the Ptolemaic rule in Egypt, while the atrocities committed by the Spanish *conquistadores* in Mexico and Peru surpass the misdeeds of the Roman army which pillaged Asia Minor in 189-188 B.C. Nor, when he turns to consider the treatment of primitive peoples, can the Western historian congratulate himself very heartily upon the fact that the behaviour of the French colonists in Canada towards the local Red Indians can bear comparison with the best practice of the Romans in their dealings with European and African peoples on the same low level of culture; for unhappily this clean French page in the history of our modern Western colonization is an exceptional leaf in the Recording Angel's book. The lion's share of North America has fallen in the end to the French Canadians' English-speaking rivals;¹ and, although the French have played one of the leading parts in the subsequent opening up of Africa, and have partially maintained on the Senegal in the nineteenth and twentieth centuries the noble reputation which they first earned on the St. Lawrence in the seventeenth and eighteenth centuries,² the Western conquest of Africa has not, as we have seen, been by any means an exclusively French achievement. When we turn from the single French page to the record of the Belgians in the Congo and of the English-speaking peoples in North America and Kenya, we have to blush at passages which are almost without parallel in the history of Roman imperialism. The Romans did not exterminate the primitive inhabitants of Transappennine Europe,³ as the primitive inhabitants of North America have been exterminated by the English-speaking settlers of the United States.⁴

¹ For this victory of the English-speaking colonists in the struggle between the Western competitors for the acquisition of North America see II. C (ii) (a) 1, vol. i, p. 211, and II. D (ii), vol. ii, pp. 65-73, above.

² See II. C (ii) (a) 1, vol. i, p. 225, above.

³ See V. C (i) (c) 1, Annex, pp. 569-74, below.

⁴ For the vein of ruthlessness in the modern English method of overseas settlement see II. C (ii) (a) 1, Annex, in vol. i, above. For the fate of the Red Indians in the United States see II. C (ii) (a) 1, vol. i, pp. 212 and 214, and II. D (vii), vol. ii, p. 277, footnote 2, above.

Nor, when they reduced the conquered native populations to the status of hewers of wood and drawers of water,¹ did the privileged citizens of a Roman colonial city-state attempt to segregate themselves from their fallāhīn by an impassable barrier of caste like the gulf of race-feeling that divides the English-speaking settlers in Kenya Colony from their Indian fellow immigrants and from their Bantu native labour force. When we remind ourselves of the historical fact that, in spite of this more liberal attitude and *éthos*, these Roman colonies in *partibus barbarorum* degenerated into parasitic growths which were eventually swept away by a proletarian revolution,² we shall find ourselves wondering what expectation of life there may be for a modern Western colonial enterprise like Kenya Colony, where a community of about 18,000 White immigrants is striving to-day to dominate about 55,000 Indian and Arab immigrants and 3,200,000 Black African 'Natives' in order to subordinate their welfare to the White minority's interests.

It is now manifest that our own Western Society, as well as the other non-Hellenic societies, can furnish us with examples of three social types—the conqueror, the wastrel, and the hangman—of which we identified our first specimens among the members of the dominant minority of the Hellenic Society in its disintegration. Happily, however, the comparison works out for good as well as for evil; for we have also seen that the Hellenic dominant minority displays a wide range of spiritual variety beyond the narrow limits of these three repulsive types; and the figures that are blazoned on the brighter side of a Hellenic shield can likewise be matched by examples from the membership of the other civilizations.

For instance, the Roman public servant, as he shows himself at his best over a span of two and a half centuries in Augustus's minister Agrippa (*vivebat* 63–12 B.C.) or in Severus's minister Dio Cassius (*vivebat circa* A.D. 155–235), has his worthy counterpart in the Hindu World to-day in 'the Indian Civilian': a child of the British Rāj who has been aptly named, since it is India's need of civic salvation that has called him into existence, while the standard of service which he has set before himself is not a racial idiosyncrasy of the European founders of this Indian institution, but is a spiritual ideal which can captivate and convert and inspire any human soul, irrespective of the shape or colour of its bodily tenement. The medium through which the tradition of the Indian Civil Service is transmitted is not the physical heritage of racial kinship but the spiritual communion of *esprit de corps*; and

¹ See Part III. A, vol. iii, pp. 98–9, above.

² *Ibid.*, pp. 99–100, above.

it is a recognition of this truth that has nerved British statesmanship in our generation to undertake the task of transferring the responsibility for the government of India from English to Indian shoulders. An Englishman of little faith, who finds himself doubting whether this hazardous enterprise can ever be brought to a successful issue, may take heart from the reflection that in the history of the Roman Civil Service the spiritual force of *esprit de corps* did prove equal to the demand that was made upon it when the responsibility for the government of the Hellenic universal state was handed on from an Italian Agrippa or Agricola to an Asiatic Arrian or Dio.

The fact remains, however, that the genesis of the Indian Civil Service is to be found in the labours of Europeans who have been bred in the tradition of Western Christendom; and, while this historical fact may not reveal the whole truth about the Indian Civil Service itself, or foreshadow its ultimate destiny as an Indian institution, it may still serve to remind us that our own Western Society, in its Modern and its 'Post-Modern' Age, has displayed other types in its governing class besides those of the war-lord and the despot and the capitalist. In England in the sixteenth century of the Christian Era this governing class brought forth not only a Henry VIII to play the tyrant's part, but also a Saint Thomas More to lay down his life rather than lend his countenance to the tyrant's policy. In the same century in Lombardy 'the poisoned field' which produced a weed after its own kind in the person of Rodolfo Gonzaga at the same time gave birth to a saint in Rodolfo's brother Aluigi.¹ In the seventeenth century in France the parasitic *noblesse* from which Louis XIV recruited his corrupt and extravagant court was also the recruiting-ground for the high-minded religious community of Port Royal. Nor are we dependent, for proving our point, upon a more or less capricious selection of individual illustrations. The truth is more convincingly demonstrated by a general change of aim and *ethos* which has declared itself unmistakably in the lives of the states of our modern Western World in the course of the last hundred years. It is true that these states have not put off the Old Adam. They are still the expressions and instruments of a lawless will to power—a power of evil which, in our generation, is threatening to bring our society to irretrievable disaster. At the same time we can see that they have latterly begun to assume a second aspect which is so alien from the other that ultimately the two must assuredly prove to be mutually incom-

¹ See the brilliant picture in *The Vocation of Aloysius Gonzaga* (London 1929, Sheed and Ward), by Father C. C. Martindale, S.J., of the identic social environment in which these two brothers grew up to lead two lives which were as different from each other as any two lives could well be.

patible. While continuing to be used as instruments of an immoral violence, these states are now also beginning to be used simultaneously as a means to social welfare. Even in the most old-fashioned communities of our twentieth-century Western World the traditional military state and police-state is now concerning itself to some extent with the promotion of health and education and employment. Nor is the modern Western State only shifting its balance of activity in practice; it is also laying more and more emphasis upon the novel aspect of its functions; and the public pose is perhaps even more significant than the underlying reality; for in thus seeking to present itself to its subjects in the guise of a ministering angel or a fairy godmother, instead of parading as a strong man armed or as a beast of prey, the modern Western State is implicitly concurring in a moral condemnation of its own blood-stained past. In this changing picture of the Western State we can discern at least a partial change of heart in our modern Western governing class; and this change is clearly analogous to the change that came over the Roman governing class in and after the generation of Augustus.¹

Our own society is not, however, unique in furnishing us with counterparts of the Roman civil service. The Confucian litterati who administered the Sinic universal state under the Han Dynasty (*imperabant* 202 B.C.—A.D. 221) attained a standard of service and acquired an *esprit de corps* that place them on a moral level with the Roman civil servants of the first and second centuries of the Christian Era in the Hellenic World and with the English civil servants of the nineteenth and twentieth centuries in Europe and India. Even the *chinovniks* who administered the Orthodox Christian universal state in Russia for two centuries, from the reign of Peter the Great (*imperabat* A.D. 1682–1725) to the reign of Nicholas II (*imperabat* A.D. 1894–1917), and who became a byword, at home as well as in the West, for their incompetence and corruption, may be let off more lightly by the verdict of History when their record can be compared with that of the régime which has now taken their place. On this showing, Posterity will perhaps pronounce that, after all, this Petrine Russian officialdom did not acquit itself so discreditably in wrestling with the gigantic dual task of maintaining the Muscovite Empire as a going concern and at the same time transforming it into a new-fangled polity on the

¹ For an illuminating use of this analogy to illustrate the change of heart in the modern Western governing class in England towards the middle of the nineteenth century—a change which here found its practical expression in the passage of the Factory Acts and in the establishment of the Home Civil Service—see J. L. and Barbara Hammond: *The Rise of Modern Industry* (London 1925, Methuen), chap. 15, especially pp. 255–7.

Western pattern.¹ In the main body of Orthodox Christendom the Slave-Household of the Ottoman Pādishāh, which has likewise become a byword for its repression of the *ra'īyeh*, will also perhaps come to be remembered as an institution which performed at least one signal service for the Orthodox Christian Society in imposing upon it, even by main force, that *Pax Ottomanica* which gave a self-tormented world a brief spell of quiet between two weary ages of anarchy.² In the Far Eastern Society in Japan the feudal daimyos and their henchmen the Samurai, who preyed upon Society, in preying upon one another, during the four centuries preceding the establishment of the Tokugawa Shogunate, survived to redeem their own past by lending themselves to Ieyasu's constructive work of converting a feudal anarchy into a feudal order; and at the opening of the next chapter of Japanese history they rose to a height of self-abnegation which was almost sublime when they voluntarily divested themselves of their ancestors' harshly won and tightly held privileges because they were convinced that this supreme sacrifice was required of them in order to enable Japan to hold her own in the environment of a Westernized World from which she could no longer hold aloof.

This vein of nobility which reveals itself to a discriminating eye in the Japanese Samurai and in the Ottoman *qullar* is the notorious virtue of two other ruling minorities: the Incas who were the masters of the Andean universal state, and the Persian grandees who governed a Syriac universal state as vicegerents of an Achæmenid King of Kings. The nobility of the *orejones* and the *megistânes* is vouched for by the testimony of alien conquerors who supplanted them and reigned in their stead and put on record, from first-hand acquaintance, the only accounts of them that we possess (for both these ruling minorities were singularly dumb, considering the importance and the eminence of their historic roles). This testimony is unimpeachable where it gives a good report, since the alien usurpers had two strong incentives to blacken their predecessors' memory. They would be prone to

¹ Since this sentence was written, there have been indications that the reputation of the Imperial Russian *chinovniks* may be destined to be rehabilitated by the piety of their Communist successors in office! *The Manchester Guardian* of the 16th September, 1937, contains an account of a text-book of Russian history, produced under the direction of a Professor Shestakov, which is reported to have been officially commended as approaching, more nearly than any one of forty-five competing pieces of work, to Stalin's idea of what such a text-book ought to be. The merit of Professor Shestakov's work, from Stalin's point of view, appears (according to the *Izvestiya* of the 24th August, 1937) to have lain, among other things, in the fact that, in this Communist presentation of Russian history, the Tsars Ivan III and Ivan the Terrible and Peter the Great are given their meed of praise as empire-builders who laid the foundations of the U.S.S.R.

² See Part III. A, vol. iii, pp. 26-7, and IV. C (ii) (b) 1, vol. iv, p. 70, above, and V. C (ii) (a), vol. vi, pp. 190-1, below.

depreciate the military prowess of warriors whom they had easily beaten at their own game, and they would be tempted to vilify the moral character of rulers whom they had wrongfully despoiled of their empire.¹ With these considerations in mind, we may believe without hesitation any good that the Spaniards tell us of the Incas, or the Greeks of the Persians; and in both records the good report conspicuously predominates over the bad.

In the Greek portrait of the Persians Herodotus's famous thumbnail sketch of the Persian boys' education—'they train them from the age of five to the age of twenty to do three things, and three things only: to ride and to shoot and to speak the truth'²—is not discredited by the companion picture that is presented to us of these same Persians in their manhood. There is the Herodotean tale of Xerxes' suite in the storm at sea doing obeisance to their Imperial Master and then leaping overboard to their deaths in order to save the Pādishāh's life by lightening the vessel in which the discomfited Achaemenian war-lord was fleeing from Europe to Asia after his defeat at Salamis.³ And there is the less tragic incident, of which Xenophon was an eye-witness, when the grandees on the staff of Cyrus the Younger responded with the same unhesitating promptness to the summons of their master to sacrifice—on this occasion not their lives but their hardly less precious finery. The spectacle of these Persian nobles in their gorgeous raiment eagerly plunging into the mud in order to put their shoulders to the wheels of the baggage wagons made a deep impression on the mind of the Greek observer, as any reader of his narrative can tell.⁴ But the most impressive of all Greek testimonies to Persian virtues is that of Alexander the Great, who showed by grave acts, and not just by easy words, how highly he thought of the Persians after he had made their acquaintance. He had no sooner come to know these Persians by the searching test of their reaction to an overwhelming disaster than he took a decision which was not only bound to offend his own Macedonians

¹ For the influence of these motives on the minds of the Spanish historians of the Incas see Baudin, L.: *L'Empire Socialiste des Inka* (Paris 1928, Institut d'Ethnologie), p. 4. On the other hand, one of the most influential of these historians, Garcilaso de la Vega, shows a bias—which has to be discounted—in favour of the Incas owing to the pride that he took in the Inca blood that ran in his own veins. (His mother was a niece of the Emperor Huayna Capac.) For a less favourable interpretation of the record of the Incas as a ruling minority see Cunow, H.: *Geschichte und Kultur des Inkareiches* (Amsterdam 1937, Elsevier,) pp. 34, 35-6, 41, 42, 46-7, 48, 49-50. The author draws attention to the vigour and obstinacy of the resistance which the Incas encountered at every stage of their progressive conquest of their empire, and he finds no reason for believing that the conquered peoples ever became reconciled to the Incas' rule. This judgement, however, seems to be exceptional, and it is modified by Cunow himself when he comes down to details (see, for example, op. cit., pp. 88-9, for the moderation of the *corvées* which the Incas imposed on their subjects).

² Herodotus, Book I, chap. 136.

⁴ See Xenophon: *Expedition Cyri*, Book I, chap. 5, §§ 7-8.

but was the surest way of outraging their feelings that he could have hit upon if this had been his deliberate aim. He decided to take the Persians into partnership in the government of an empire which the Macedonians' prowess had wrested, only yesterday, out of the Persians' hands; and he put this policy into execution with characteristic thoroughness. He took a Persian grandee's daughter to wife; he bribed or browbeat his Macedonian officers into following his example; and he drafted Persian recruits into his Macedonian regiments. A people who could evoke this extraordinary tribute from the leader of their hereditary enemies—and this on the morrow of their own utter military defeat—must have been transparently endowed with the classic virtues of 'a ruling race'.¹

We have now managed to marshal a considerable array of evidence for the capacity of dominant minorities to produce an admirable governing class; and this evidence is borne out by the catalogue of the universal states that have been created by the dominant minorities of disintegrating civilizations; for the establishment and maintenance of a universal state presupposes the existence of a governing class with a high standard of conduct, a strong *esprit de corps*, and a persistent tradition.

In the course of previous inquiries² we have found incidentally that, out of twenty civilizations which have unquestionably broken down,³ no less than fifteen have passed through a universal state on their road from breakdown towards dissolution. We have identified a Hellenic universal state in the Roman Empire;⁴ an Andean in the Empire of the Incas;⁵ a Sinic in the Empire of the Ts'in and Han dynasties;⁶ a Minoan in 'the thalassocracy of Minos';⁷ a Sumeric in the Empire of Sumer and Akkad;⁸ a Babylonian in the Neo-Babylonian Empire of Nabopolassar and Nebuchadnezzar;⁹ a Mayan in 'the Old Empire' of the Mayas;¹⁰ an Egyptian in 'the Middle Empire' of the Eleventh and Twelfth Dynasties;¹¹ a Syriac in the Achaemenian Empire;¹² an Indic in

¹ For the effect of Alexander's discovery of the Persians' true character in leading the Macedonian man of genius to his greater discovery of the unity of Mankind see V. C (i) (d) 7, vol. vi, p. 9, below.

the Empire of the Mauryas;¹ a Hindu in the Timurid Empire of Akbar and Awrangzib.² We have distinguished a Russian Orthodox Christian universal state in the Muscovite 'Empire of All the Russias',³ and another Orthodox Christian universal state, embracing the main body of Orthodox Christendom, in the Ottoman Empire;⁴ and in the Far Eastern World we have met with a corresponding pair: the Tokugawa Shogunate in Japan⁵ and the Mongol Empire in China.⁶

We have also observed that a number of these universal states have been prolonged (to their natural term) or restored (after a lapse) or reintegrated (after an interval of alien intrusion) by other hands than those which originally created them. The Empire of the Incas was taken over forcibly by the Spaniards and prolonged in the Spanish Viceroyalty of Peru.⁷ The Empire of Sumer and Akkad was restored by the First Dynasty of Babylon in the reign of Hammurabi.⁸ The Neo-Babylonian Empire was engulfed in the Achaemenian Empire,⁹ and this in its turn was taken over forcibly by Alexander, and was prolonged by Alexander's Seleucid successors, before it was eventually broken up by Roman and Parthian hammer-strokes and was subsequently reintegrated by the labours of the Umayyads and 'Abbasids after the complete and final expulsion of the Hellenic intruders from the Syriac Society's domain.¹⁰ The Egyptiac 'Middle Empire' of the Eleventh and Twelfth Dynasties was re-established, after a very much shorter breach of continuity, in 'the New Empire' of the Eighteenth and Nineteenth Dynasties.¹¹ The Empire of the Mauryas was partially taken over and prolonged by Hellenic conquerors from Bactria, and by these Greek empire-builders' Kushan successors, and was eventually reintegrated by the Guptas, who stand to the Mauryas as the 'Abbasids stand to the Achaemenidae.¹² The Timurid Empire of Akbar and Awrangzib was restored—in more solid masonry and also, perhaps, on a sounder architectural plan—in the British Rāj.¹³ The Mongol Empire over China was re-established, to all

⁹ I. C. (i) (b), vol. i, p. 119, above.

¹⁰ I. C. (i) (b), vol. i, pp. 72-7, above. It is noteworthy that this final reversal of Alexander's feat of imposing Hellenism upon the Syriac World by force of arms was followed by a voluntary reception of Hellenic culture on the part of the Syriac Society in the 'Abbasid Age. This cultural contact between the Syriac and Hellenic societies at this stage of their intercourse is examined in Part IX, below.

Chinese intents and purposes, in the Manchu Empire,¹ which stands to it as the Egyptian 'New Empire' stands to the Egyptian 'Middle Empire'.

It will be observed that—as might have been expected *a priori*—these works of rehabilitation have been performed, more often than not, by new arrivals on the scene who have been culturally alien from the original builders. The Spaniards, for example, were wholly alien from the Incas; the Achaemenidae from the Babylonians; the Macedonians from the Achaemenidae; the Greek and Kushan invaders of India from the Mauryas; and the British from the Timurids (as well as from the Hindus). Even the Amorite Hammurabi, though he was the sixth of his line to reign in Babylon, was probably looked askance at, as a not yet completely reclaimed barbarian, by his Akkadian subjects and *a fortiori* by their Sumerian fellow citizens of that 'Empire of the Four Quarters' which actually owed its restoration to Hammurabi's prowess and statesmanship. And this was certainly the attitude of the Chinese to the Manchus from beginning to end of the Manchu régime, in spite of the Manchus' almost complete freedom from that tincture of an alien civilization which had evoked in Chinese hearts a fanatical hatred against the Manchus' predecessors, the Mongols.²

We shall even find several further examples of alien handiwork among those universal states which were 'original work' and were not restorations of some older building. For example, the Timurid Turks, who made the first essay in providing the disintegrating Hindu Society with a universal state, were children of the Iranic Society and, by this token, were just as alien from the Hindu World as are their British successors. The 'Osmanlis, who gave the main body of Orthodox Christendom the only universal state that it has ever known, were the Timurids' cultural as well as racial brethren. The Mongols, who gave the main body of the Far Eastern Society its first universal state, were decidedly more alien in culture from their Chinese subjects than were the Manchus who afterwards repeated the Mongols' feat.³

Of the other original creators of universal states, a majority—which includes the Romans, the Incas, the Achaemenidae, the Ts'in, the Theban Dynasties, the Muscovites, and the Tokugawas—were Powers which had qualified for the role of empire-builders

¹ IV. C (ii) (b) 2, vol. iv, p. 87, above.

³ For the tinge of Far Eastern Christian culture in the social 'make-up' of the Mongols see II. D (vi), vol. ii, pp. 237-8, and II. D (vii), Annex VIII, vol. ii, above, and V. C (i) (c) 4, in the present volume, p. 348, below.

by serving an apprenticeship as wardens of the marches;¹ and these frontiersmen on an imperial throne have often been viewed by their more cultivated but less capable subjects in the interior with the eyes of a Sumerian litteratus looking down his nose at a Hammurabi. This, as we know from their own written testimony, was the attitude of Greek men-of-letters towards Roman statesmen and administrators as late as the Age of the Antonines, when these Romans were actually practising, with an effectiveness that no Greek had ever approached, that benevolent 'Hellenic superintendence' (*Ἑλληνικὴ ἐπιμέλεια*) which, five hundred years before, had been so earnestly commended to King Philip by Isocrates.²

In so far as the universal states of which we have made this summary survey³ prove to have been the work of alien hands, they cannot, of course, be taken as evidence of creative power in any fraction of the disintegrating society on whose ground they have been set up. It would, however, be hypercritical to stigmatize the frontiersmen empire-builders as aliens simply because the people of the interior have affected to regard them as such. If we examine more closely the Hellenic case in point, we shall probably come to the conclusion that the Greek rhetor's sensitiveness to the barbarism of the Roman official was not an entirely genuine feeling, but was partly the expression of a self-defensive mental attitude—a refusal to face the humiliating fact that the converted barbarian had proved himself, by Isocrates' own test, to be a better Hellene than the Greek himself.⁴ It would, indeed, be a paradox to maintain that the Romans were no true representatives of the Hellenic

¹ For 'the stimulus of pressures' which has so often given 'marches' an ascendancy over 'interiors' see II. D (v), vol. ii, above.

² Φημί γὰρ χρῆναί σε τοὺς μὲν Ἕλληνας εὐεργετεῖν, Μακεδόνων δὲ βασιλεῦν, τῶν δὲ Βαρβάρων ὡς πλείστων ἄρχεω· ἦν γὰρ ταῦτα πράττης, ἅπαντές σοι χάριν ἔξουσιν, οἱ μὲν Ἕλληνες ὑπὲρ ὧν ἂν εὖ πάσχωσι, Μακεδόνες δ' ἦν βασιλικῶς ἀλλὰ μὴ τυραννικῶς αὐτῶν ἐπιστατῆς, τὸ δὲ τῶν ἄλλων γένος ἦν διὰ σὲ Βαρβαρικῆς δεσποτείας ἀπαλλαγέντες Ἑλληνικῆς ἐπιμελείας τύχουσιν.—Isocrates; *Philippus*.

³ A complete table of the universal states that come within the purview of the present Study will be found at the end of V. C (iii), in vol. vi, p. 327, below.

⁴ In an earlier chapter of the story of the Greeks' encounter with the Romans—at a stage in which the Romans were still engaged in wrecking the Hellenic Society that they were afterwards to reconstruct—the Greek pretence that the Romans were barbarians had proved impossible to keep up:

'It is said that when Pyrrhus caught his first bird's eye view, from an observation post, of the Roman army in formation, he remarked that he could see nothing barbarous about the barbarians' order of battle; and similar confessions were extorted from Greeks who were making their first acquaintance with Titus [Quintus Flaminius]. They had had it from the Macedonians that a fellow in command of a barbarian host was on the war-path, conquering and enslaving as he came; and now they found themselves in the presence of a young man of gracious mien who was a Greek in speech and accent and was ambitious to deserve true honour. Of course they were extraordinarily charmed, and, when they left his presence to go off to their respective homes, they turned the tide of public feeling in Titus's favour—bringing tidings of him as a leader who had come to conduct the Greeks into the promised land of freedom.'—Plutarch: *Life of Titus Quintus Flaminius*, chap. 5. The fourth-century Greek scholar Heracleides Ponticus hit the mark when, in the earliest mention of Rome in extant Greek literature, he described her as 'a Hellenic city' (see V. C (i) (c) 3, p. 212, footnote 3, below).

dominant minority, or the Thebans of the Egyptian. And, even if we leave the borderline cases on one side, there are a number of instances still left in which there can be no dispute over the claim of the creators of a universal state to be representatives of the dominant minority of the society in whose domain the state has been established. Among these unquestionable exponents of a dominant minority's political creative power we may cite the Han Dynasty and 'Minos', the dynasty of Ur and the Neo-Babylonians, the Mauryas and the Guptas.

Is this political capacity the only kind of creative power that is a common attribute of dominant minorities? The question presents itself because in our analysis of the various types of character and activity in the Hellenic dominant minority we found that the creative type was not, in this case, confined to the political field. It was represented not only by the Roman public servant but also by the Greek philosopher;¹ and, if we now repeat the procedure, which we have been following so far, of surveying the lives of the other civilizations in their disintegration in order to learn whether the Hellenic phenomena reappear in them, we shall see that the Greek philosopher, as well as the Roman public servant, has his non-Hellenic counterparts. While we have found about ten disintegrating civilizations, besides the Hellenic, in which the Dominant Minority can be credited with the creative achievement of having established a universal state, we can find at least three, besides the Hellenic, in which the Dominant Minority has also thought out a philosophy.

In the history of the Babylonian Society, for example, the terrible eighth century B.C., which saw the beginning of the Hundred Years' War between Babylonia and Assyria,² seems also to have seen a sudden great advance in astronomical knowledge.³ In this age Babylonian men of science discovered that the rhythm of cyclic recurrence, which had been patent, from time immemorial, in the alternations of Night and Day and in the waxing and waning of the Moon and in the Solar Cycle of the Year, was also discernible on a vaster scale in the secular motions of a heavenly host which included the planets. These stars which were traditionally named 'the wanderers' *par excellence*, in allusion to their apparently erratic courses, now proved to be bound by as strict a discipline as the Sun or the Moon or 'the fixed stars' of the Firmament in the Cosmic Cycle of a *Magnus Annus*;⁴ and this exciting Babylonian discovery

¹ See pp. 39-40, above.

³ See Meyer, E.: *Geschichte des Altertums*, vol. i, part (ii), third edition (Stuttgart and Berlin 1913, Cotta), pp. 591-5; vol. iii, first edition (Stuttgart 1901, Cotta), pp. 132-4.

⁴ See IV. C (i) vol. iv, pp. 23-4 and 37, above.

of a hitherto unsuspected application of a familiar law of Physical Nature had much the same effect as our recent Western scientific discoveries have had upon the discoverers' conception of the Universe.

The never broken and never varying order that had thus been found to reign in all the known movements of the stellar cosmos was now assumed to govern the Universe as a whole: material and spiritual, inanimate and animate.¹ If an eclipse of the Sun or a transit of Venus could be dated with certainty to some precise moment hundreds of years back in the past, or predicted with equal certainty as bound to occur at some precise moment in an equally remote future, then was it not reasonable to suppose that human affairs were just as rigidly fixed and just as accurately calculable? And since the cosmic discipline implied that all these members of the Universe that moved in so perfect a unison were 'in sympathy'—*en rapport*—with each other, was it unreasonable to assume that the newly revealed pattern of the movements of the stars was a key to the riddle of human fortunes, so that the observer who held this astronomical clue in his hands would be able to forecast his neighbour's destinies if once he knew the date and moment of his birth? Reasonable or not, these assumptions were eagerly made; and thus a sensational scientific discovery gave birth to a fallacious philosophy of Determinism which has captivated the intellect of one civilization after another and is not quite discredited yet after a run of nearly 2,700 years.

The seductiveness of Astrology lies in its pretension to combine a theory which explains the whole *machina mundi* with a practice that will enable Tom, Dick, and Harry to spot the Derby Winner here and now. Thanks to this twofold attraction the Babylonian philosophy was able to survive the extinction of the Babylonian Civilization in the last century B.C.;² and the Chaldean *mathematicus* who imposed upon a prostrate Hellenic Society³ was represented until yesterday by the Court Astrologer at Peking and the Munejjim Bāshy at Istanbul.

We have dwelt on this Babylonian philosophy of Determinism because it has a greater affinity than any of the Hellenic philosophies

¹ For the belief in a rule of Fate, which is one of the intellectual expressions of a sense of drift that is itself one of the symptoms of a schism in the Soul, see V. C (i) (d) 4, pp. 412-31, below.

² For the incorporation of Astrology into Mithraism see V. C (i) (d) 6 (δ), p. 540, below.

³ See Wendland, P.: *Die Hellenistisch-Römische Kultur*, 2nd and 3rd editions (Tübingen 1912, Mohr), pp. 132-3, and Tarn, W. W.: *The Greeks in Bactria and India* (Cambridge 1938, University Press), pp. 59-60. In taking over Astrology from its Babylonian fathers in and after the 2nd century B.C. the Hellenes put their own imprint upon it, as is witnessed by the fact that, in India at the present day, some of the current technical terms of the practitioners of this pseudo-science are etymologically of Greek origin.

have with the still perhaps rather callow philosophical speculations of our own Western World in its present Cartesian Age. On the other hand there are counterparts of almost all the Hellenic schools of thought in the philosophies of the Indic and the Sinic World. The dominant minority of a disintegrating Indic Civilization brought forth the Jainism of Mahavira, the Primitive Buddhism of Siddhārtha Gautama,¹ the transfigured Buddhism of the Mahāyāna² (which differs from its acknowledged original at least as profoundly as Neoplatonism differs from the philosophy of Socrates), and the diverse Buddhistic philosophies that are part of the mental apparatus of a post-Buddhaic Hinduism. The dominant minority of a disintegrating Sinic Civilization brought forth the moralized ritualism and ritualized morality of Confucius and the paradoxical wisdom of the Tao which is ascribed to the legendary genius of Lao-tse.³

2. *Internal Proletariats*

A Hellenic Prototype.

When we pass from dominant minorities to proletariats, a closer examination of the facts will confirm, here too, our first impression that within each of the fractions of a disintegrating society there is a certain diversity of type. We shall also find, however, that, in the range of this spiritual diversity, the internal and the external proletariats are at opposite poles. While the external proletariats have a gamut which is narrower than that of the dominant minorities, the gamut of the internal proletariats is very much wider. Let us reconnoitre the wider field first.

If we wish to enter upon our survey of internal proletariats by our now customary way of approach—that is, by taking the Hellenic instance first as our standard of comparison—and if we also wish to follow the genesis of the Hellenic internal proletariat from the beginning of the embryo stage, we cannot begin better than by quoting a passage from Thucydides in which the historian of the breakdown of the Hellenic Society describes the consequent social schism in its earliest phase, as it showed itself first in Corcyra.⁴

¹ See I. C (i) (b), vol. i, p. 87, above, and V. C (i) (c) 2, in the present volume, pp. 131-2, below.

² See I. B (iii), vol. i, p. 35; II. D (vi), Annex, vol. ii, p. 405, footnote 1; IV. C (ii) (b) 1, vol. iv, p. 65, above; and V. C (i) (c) 2, in the present volume, pp. 133-46, below.

³ See I. C (i) (b), vol. i, p. 89, and III. C (i) (c), vol. iii, pp. 187-9, above, and V. C (i) (c) 2, in the present volume, pp. 146-7, below.

⁴ For the whole story of these Corcyraean faction-fights (*gerebantur* 427-425 B.C.) during the first phase of the Atheno-Peloponnesian War of 431-404 B.C. see Thucydides, Book III, chaps. 70-85, and Book IV, chaps. 46-8. The story has already been cited in IV. C (ii) (b) 1, vol. iv, p. 63, and IV. C (iii) (b) 9, vol. iv, p. 204, above.

'Such was the savagery of the class-war (*stasis*) at Corcyra as it developed, and it made the deeper impression through being the first of its kind—though eventually the upheaval spread through almost the whole of the Hellenic World. In every country there were struggles between the leaders of the Proletariat and the reactionaries in their efforts to procure the intervention of the Athenians and the Lacedaemonians respectively. In peace-time they would have had neither the opportunity nor the desire to call in the foreigner; but now there was the War; and it was easy for any revolutionary spirits in either camp to procure an alliance entailing the discomfiture of their opponents and a corresponding reinforcement of their own faction. This access of class-war brought one calamity after another upon the countries of Hellas—calamities that occur and will continue to occur so long as Human Nature remains what it is, though they may be aggravated or mitigated or modified by successive changes of circumstance. Under the favourable conditions of peace-time both countries and individuals display a sweeter reasonableness, because their hands are not forced by the logic of events; but War eats away the margins of ordinary life and, in most characters, adjusts the temperament to the new environment by its brutal training. So the countries of Hellas became infected with the class-war, and the sensation made by each successive outbreak had a cumulative effect upon the next.'¹

Having thus put his finger on the war-spirit as the demoralizing spiritual force which shattered the Hellenic Society's moral solidarity, Thucydides goes on to make a brilliant analysis, which is at the same time an overwhelming indictment, of the demonic impulses of evil which were thus let loose in men's souls like the swarm of evil sprites that poured out of Pandora's wantonly opened box.

'It was a competition of ingenuity in the elaboration of intrigue and in the refinement of reprisals. The customary meaning of words was arbitrarily distorted to cover the conduct of those who employed them. Reckless irresponsibility was treated as courageous loyalty, cautious reserve as cowardice masked under a high-sounding name, restraint as a cloak for poor-spiritedness, and the policy of reason as a policy of *laissez faire*. A frenzied fanaticism was the popular ideal of conduct, while intrigue that took no risks was regarded as a legitimate method of self-defence. Violence of feeling was a warrant of honesty, deprecation of violence a signal for suspicion. Success in intrigue was the test of intelligence and the detection of intrigue a testimonial to superior cleverness, while anyone who so shaped his policy as to dispense with such methods was pilloried as a nihilist towards his own group and a weakling in face of their opponents. In short, approbation was reserved for those who forestalled their enemies in striking a blow or who implanted that suggestion in minds which had not previously conceived

¹ Thucydides, Book III, chap. 82.

it. The ties of party actually became closer than those of kinship,¹ because partisans were readier than kinsmen to throw themselves into an adventure at a moment's notice, and the associations in question were formed, not to secure the benefits of established institutions, but to gain illegitimate advantages by violating them. Complicity in crime was a more effective sanction for loyalty to engagements than a solemn oath. A fair offer from opponents was received as a signal for practical precautions by the dominant party of the moment, instead of evoking any generous response. The exaction of reprisals was valued more highly than an immunity from wrongs demanding them. The rare covenants of reconciliation were only entered into on either side as a momentary last resort and only observed so long as no alternative resource presented itself. Any one who spied a weak spot in his adversary's armour and had the nerve to seize his opportunity took more satisfaction in obtaining his revenge by treachery than in obtaining it in fair fight, the dominating considerations being the elimination of risk and the added halo of intellectual brilliance investing the triumphs of perfidy. . . .

'The cause of this whole phenomenon was the thirst for power arising from the predatory and competitive impulses—impulses which engender conflict, from which passion is engendered in its turn. In all the countries of Hellas the party leaders invented high-sounding catch-words and posed as the champions of political equality for the masses or of moderate conservatism, in order to make spoils out of the public interest which they served with their lips. In their unscrupulous struggle to gain the upper hand over one another they hesitated at nothing and surpassed themselves in the prosecution of their vendettas.' So far from attempting to act within the bounds of moral right and national interest, they recognized no limitations on either side except the caprice of the moment. They did not shrink from bringing themselves into power by verdicts immorally obtained against their opponents, if not by naked force, in order to satiate their momentary rancour. In fact, Religion had lost its hold upon either party, and they relied upon their powers of misrepresentation to retrieve their good name whenever they had occasion to perpetrate an invidious action. Meanwhile the moderate elements in every country were preyed upon by the extremists of both camps, partly for their refusal to take sides and partly out of resentment at the prospect of their survival.

'Thus the class-war plunged the Hellenic Society into every kind of moral evil.'²

This spiritual débâcle which followed the outbreak of the Atheno-Peloponnesian War in 431 B.C. continued unchecked during the century of warfare and revolution which was the aftermath of the great catastrophe, and the first social effect was to

¹ Compare Matt. x. 21 and 34-7 = Luke xii. 51-3, xiv. 25-7, and xxi. 16-17 (quoting Micah vii. 6); Matt. xii. 46-50 = Mark iii. 31-5 = Luke viii. 19-21. —A.J.T.

² Thucydides, Book III, chaps. 82-3.

produce a large and ever larger floating population of 'stateless' exiles. During the growth of the Hellenic Civilization the experience of being thus uprooted from one's native social setting had been as rare to meet in Hellas as it had been dreadful to contemplate. Yet the surviving monuments of the Hellenic literature of that age testify clearly that this dreaded experience was foreknown to be the penalty for fratricide. It is one of the maxims of the Homeric Nestor's legendary wisdom that 'outcast, outlawed, out-homed is he who is in love with the lacerating warfare that rends the bosom of the People';¹ and an Athenian poet who was in his prime in the generation before the catastrophe of 431 B.C., and who was only just spared by Death from seeing his country brought low after twenty-seven years of demoralizing conflict, has written a stanza that is a judgement on his own civilization—and on ours.

The craft of his engines hath passed his dream,
In haste to the good or the evil goal.
One holdeth his city's law supreme
And the oath of God in his inmost soul;
High-cited he: citiless the other
Who striveth, grasping at things of naught,
On the road forbidden. From him be hidden
The fire that comforts and the light of thought.²

Sophocles himself lived to see Hellas smitten with this curse; and, within a hundred years of the date at which these foreboding lines were written,³ the Hellenic World was swarming with homeless exiles.⁴ The evil was not overcome by Alexander's great-hearted attempt to induce the reigning faction of the moment in each city-state to allow its ejected opponents to return in peace to their hearths and homes;⁵ and the fire made fresh fuel for itself; for the one thing that the exiles found for their hands to do was to

¹ 'Αφρότηρ, ἀθέμιστος, ἀνέστιός ἐστιν ἐκεῖνος ὃς πολέμου ἔραται ἐπιδημίου δκρύνετος.—*Iliad*, Book IX, ll. 63-4. In their present context these lines refer to the war between the Achaeans and the Trojans, and not to a civil war in the technical sense. This reference points the truth that all warfare is, 'in the last analysis', fratricidal.

² Sophocles: *Antigone*, ll. 365-75, translated by Gilbert Murray.

³ The *Antigone* appears to have been written in 440 B.C.

⁴ The state of Hellas in this age is luridly illustrated by the following anecdote, in Xenophon's *Hellenica* (Book VII. chap. 4, § 3), of an incident which appears to have occurred in the autumn of 366 B.C.:

'On his way back from Athens, [where he had been carrying out a diplomatic mission], Lycomedes [of Mantinea] met his death by a most extraordinary accident. Finding any number of ships at his disposal, he picked out the ship that took his fancy, contracted to have himself put on shore at whatever point he himself might designate, and selected for his landing-place the exact spot where the exiles [from his own country] happened to be encamped. So Lycomedes met his death in this way; but that did not prevent the alliance which he had been negotiating from being concluded.'

The tacit equation between meeting one's exiles and meeting one's death is more eloquent than words could be.

⁵ For Alexander's vision of *δμόνοια* see V. C (i) (d) 7, vol. vi, pp. 6-10, and V. C (ii) (d), vol. vi, p. 254, below.

enlist as mercenary soldiers;¹ and this glut of military man-power put fresh 'drive' into the wars by which new exiles—and thereby more mercenaries—were being created. This vicious circle of evil cause and effect first inflamed the fratricidal warfare in the bosom of Hellas itself, and then discharged the men of war who had been trained in this Hellenic school of arms to wreck the *Pax Achaemenia*—first by tempting ambitious provincial governors to break all the tabus of Persian loyalty by hiring this Hellenic weapon for use against the Pādishāh; then by giving Alexander of Macedon the means of successfully accomplishing the subversive feat which the traitor-sātraps had lacked the nerve to carry through; and finally by enabling Alexander's Macedonian successors to keep three continents in turmoil for forty years in their struggle over their master's stolen heritage.

The effect of these direct moral ravages of the war-spirit in Hellas in uprooting her children was powerfully reinforced by the operation of disruptive economic forces which the wars let loose.

For example, the wars of Alexander and his successors in South-Western Asia gave military employment to one swarm of homeless Greeks at the cost of uprooting another. For the mercenaries were paid by putting into circulation the bullion which had been accumulating for two centuries in the Achaemenian treasuries; and this sudden vast increase in the volume of currency in circulation worked havoc among those peasants and artisans in the Greek cities who had been spared by the flail of political strife. Prices soared without any immediate corresponding rise in wages,² and this financial revolution reduced to pauperism an element in the body social which had hitherto enjoyed a modest competence and a relative security.

The same effect of pauperization was produced again, a hundred years later, by the economic consequences of the Hannibalic War in Italy,³ where the peasantry were uprooted from the land, first by the direct devastation that was wrought by Hannibal's soldiery, and then by the ever longer terms of Roman military service which the Italian peasantry had to serve—and this not only in the main Italian war-zone, but in Transappennine and Transmarine 'side-shows'. These distant campaigns in the Po Basin, in the Iberian Peninsula, in Greece and in the East did not come to an end when

¹ For the melancholy history of this mercenary military service in a disintegrating Hellenic Society see Parke, H. W.: *Greek Mercenary Soldiers* (Oxford 1933, Clarendon Press); and Griffith, G. T.: *The Mercenaries of the Hellenistic World* (Cambridge 1935, University Press).

² For this indirectly but potentially subversive economic effect of Alexander's conquest of South-Western Asia see Tarn, W. W.: 'The Social Question in the Third Century' in *The Hellenistic Age* (Cambridge 1923, University Press).

Hannibal evacuated Italy or when Carthage sued for peace, but remorselessly continued to increase in range and scale and to demand ever larger drafts of Italian peasant soldiers. Under this tribulation the pauperized descendants of an Italian peasantry that had been uprooted against its will by the call of conscript military service had no resource left but to make a profession out of the career which had been imposed on their ancestors as a *corvée*; and, during the century of revolution and civil war which began in 133 B.C. with the tribunate of Tiberius Gracchus and which only ended in 31 B.C. with the Battle of Actium, 'the new poor' took their toll out of the spoils of the conquests that had been won at their grandfathers' cost by taking mercenary service under the rival war-lords who were now contending for the mastery of the new Roman Empire—as the mastery of the old Achaemenian Empire had been previously contended for, with Greek mercenary arms, by the rival successors of Alexander.

In this cruel process of 'deracination' we cannot doubt that we are watching the genesis of the Hellenic internal proletariat—and this notwithstanding the fact that, at any rate in the earlier generations, the victims of the process were *ci-devant* aristocrats as often as not. For proletarianism is a state of feeling rather than a matter of outward circumstance. When we first introduced the term 'Proletariat' into this Study, we defined it,¹ for our purpose, as a 'social element or group which in some way is "in" but not "of" any given society at any given stage of such society's history'; and this definition covers the exiled Spartiate Clearchus and the other aristocratic captains of Cyrus the Younger's Greek mercenary force whose antecedents Xenophon has sketched for us in his account of their adventure,² as well as the meanest of the unemployed Greek and Italian labourers who enlisted as mercenaries under the standard of a Ptolemy³ or a Marius. The true hall-mark of the proletarian is neither poverty nor humble birth but a consciousness—and the resentment which this consciousness inspires—of being disinherited from his ancestral place in Society and being unwanted in a community which is his rightful home; and this subjective proletarianism is not incompatible with the possession of material assets. The homeward-bound survivors of the Ten Thousand, whose home-sickness made them indignantly reject their leader Xenophon's prudent suggestion that they should close with Fortune's offer and should settle down to found a new

¹ In I. B (iv), vol. i, p. 41, above.

³ See Theocritus: *Dramatic Dialogues*, Number 14: 'All for Love of Cynisca'—a poem which must have been commissioned by the Ptolemaic Government to serve the purpose of our twentieth-century Western recruiting-posters.

Greek city-state on an ideal Asiatic site,¹ were desolated to find how unwelcome their reappearance was to their brethren at home in Hellas; and their soreness at this social rebuff was not healed by an offer of temporary economic security in the shape of a new contract for their employment as mercenary troops—this time in the Lacedaemonian service. The same iron must have entered far more deeply into the souls of the survivors of those other Greek mercenaries in a later generation who were massacred, as dangerous drones, by their Macedonian comrades-in-arms when, on the news of Alexander's death, the hirelings deserted their posts in his up-country garrisons and started on the long trek back towards Hellas. It is more surprising, and therefore more significant, to find the same consciousness of being not wanted, the same sense of grievance, and the same restlessness persisting in the souls of the time-expired veterans of Roman revolutionary armies—from Sulla's army to Octavian's—who had been fitted out with new homes and lands, and organized into new civic communities, at the cost of uprooting an equal number of innocent free-holders and contented tillers of the soil through ruthless and reckless measures of unprovoked expropriation.

Thus the Hellenic internal proletariat was recruited first of all from the free citizens, and even from the aristocrats, of the disintegrating Hellenic bodies politic; and these first recruits had been disinherited in the first instance by being robbed of a spiritual birthright; but of course their spiritual impoverishment was often accompanied, and was almost always followed, by a pauperization on the material plane; and they were soon reinforced by recruits from other sources who were material as well as spiritual proletarians from the start. The numbers of the Hellenic internal proletariat were vastly swollen by the aggression of Hellenic arms—made expert in the school of fratricidal warfare—at the expense of alien societies of both the primitive and the 'civilized' species. The conquests of Alexander and his successors swept the whole of the Syriac, Egyptian, and Babylonian societies, and a considerable part of the Indic Society,² into the Hellenic dominant minority's net, while the later conquests of the Romans swept in half the barbarians of Europe and North-West Africa.³

These involuntary alien reinforcements of the Hellenic internal proletariat were perhaps at first more fortunate than their fellow-proletarians of native Hellenic origin in one respect. Though they were morally disinherited and materially despoiled, they were not

¹ Xenophon: *Expedition of Cyrus*, Book VI, chap. 4, § 1—chap. 5, § 4.

yet physically uprooted; and a majority of them permanently escaped this fate and managed just to keep alive—like the Abbé Siéyès during the Terror of a modern revolution in the West—until they tasted, at last, their long-deferred revenge when they shook off the worn-out shackles of the Hellenic dominant minority nearly a thousand years after Alexander's passage of the Hellespont.¹ Their fortunes varied, however, according to the particular degree to which their respective Hellenic oppressors were minded to turn the screw.

In Asia the Seleucids were content (till they fell upon evil days after Antiochus the Great's disastrous encounter with the Romans)² to take a financial toll from their Oriental subjects for supplying the Royal Exchequer and for endowing newly founded city-states of the Hellenic pattern.³ Like the barbarian proletarians in Europe and North-West Africa who were similarly 'attributed' to the Roman colonial urban foundations of a rather later age, the Oriental proletarians under the Seleucid régime thus escaped comparatively lightly. In Egypt, on the other hand, the local tradition of 'the servile state', with its currency of some 2,500 years since the Age of the Pyramid-Builders,⁴ had acquired a momentum to which the Hellenic conquerors readily yielded; and here we see the Ptolemies, and their heirs the Roman Emperors,⁵ prostituting their Hellenic abilities to the prevailing Egyptian spirit, and making their 'Hellenic superintendence' a curse instead of a boon for its Egyptian recipients, by skilfully monopolizing, for the benefit of an alien Crown, the profits of all the agricultural and industrial production of the country. At the same time a Ptolemaic Egyptian peasant or factory-hand who had travelled westward and caught a glimpse of the contemporary state of the native population in the continental African dominions of Carthage would have come home thanking Isis that she had preserved her Egyptian

² In the Romano-Seleucid War of 192-188 B.C. For the effect of Roman pressure on the Seleucid Government in aggravating the Seleucid Government's own pressure upon its Oriental subjects see V. C (i) (d) 9 (β), vol. vi, pp. 103-5, especially p. 105, footnote 8, below.

³ For these foundations see Part III. A, vol. iii, pp. 98-100, and IV. C (iii) (c) 2 (β), vol. iv, pp. 311-13, above.

⁴ See III. C (i) (d), vol. iii, pp. 212-15; and IV. C (iii) (c) 2 (β), vol. iv, pp. 408-13 and 418-23, above.

⁵ The Roman Imperial Government gradually relaxed the centralized system of administrative control which it had inherited from the Ptolemies, and devolved upon Egyptian local authorities the responsibility for performing the thankless task of milking the Egyptian milch cow for the Imperial Exchequer's benefit. This policy—which was prompted by slackness and inefficiency rather than by enlightenment or benevolence—had the paradoxical result that, in Egypt alone among all the provinces of the Hellenic universal state, municipal self-government gained ground in an age when elsewhere it was losing ground to bureaucratic centralization (see Jones, A. H. M.: *The Cities of the Eastern Roman Provinces* (Oxford 1937, Clarendon Press), pp. 316-50).

servant from a worse than Egyptian fate; for, though the Egyptian worker might be robbed scientifically and systematically, like the domestic bee, of almost all the hard-won fruits of his labour, he at least remained in some sense personally free, whereas the Berber subject of Carthage was a hide-bound serf. Yet this serf, in his turn, must have thanked his stars when his conscript military service under his Carthaginian masters' flag brought him face to face with the slave-gangs on the plantations of Sicily. For the lure of the virgin western markets for wine and oil, which had led the Carthaginians to turn the conquered native inhabitants of their continental African hinterland into plantation-serfs, had simultaneously led the Agrigentines to extract the same profit from their own war-devastated and war-depopulated insular domain by stocking it with plantation slaves; and this West-Mediterranean economic régime of plantations worked with an imported slave-labour-force—a social evil of which we first catch sight in Greek Sicily in 480 B.C.—was extended, on a vaster scale and with a second string in the shape of slave-shepherded stock-breeding, to the devastated areas of Roman Italy after the Hannibalic War.¹

During the last two centuries B.C. the uprooted Italian peasant-proprietors were progressively supplanted by rootless slave-hoemen and slave-herdsmen. The wastage of this servile economic man-power on the Italian plantations and ranches was perhaps as heavy as the wastage of the nominally free military man-power of the Italian peasantry in its distant theatres of war, while the profits of the wholesale wine, oil, meat, wool, and leather production which was carried on at this human—or inhuman—cost were great enough to bear the capital charge of perpetually having to replace the human raw material (in contrast to the unprofitableness of the old-fashioned peasant proprietor's subsistence-farming, which could now no longer be made to pay, even when the state came to the peasants' aid by offering them opportunities of exchanging their ancestral holdings on the south side of the Appennines for new and larger plots carved out of the confiscated lands of conquered and evicted Gauls and Ligurians).² In consequence this age saw all the populations within range of the Mediterranean coast—both western barbarians and cultivated Orientals—being lawlessly laid under contribution in order to supply the demands of an insatiable Italian slave-labour-market.

We now see that the internal proletariat of the disintegrating Hellenic Society was composed of three distinct elements: disinherited and uprooted members of the Hellenic Society's own

¹ See III. C (i) (b), vol. iii, pp. 168–71, and IV. C (iii) (c) 3 (β), vol. iv, pp. 507–8, above.

² See V. C (i) (c) 1, Annex, pp. 569–74, below.

native body social; partially disinherited members of alien civilizations or of primitive societies who were conquered and exploited without being torn up by the roots; and doubly disinherited conscripts from these subject populations who were not only uprooted but were also enslaved and deported in order to be worked to death on distant plantations and ranches without any hope of ever seeing their homes or their kinsfolk again.¹ The sufferings of these three sets of victims were as various as their origins were diverse, but these differences were transcended by their overwhelming common experience of being robbed of their social heritage and being turned into exploited outcasts; and the confluence of these diverse streams of human misery into a single slough is celebrated in the famous lines in which the *colluvies gentium*²—Greeks, Orientals, and barbarians—in the slums of Rome is satirically described by a Roman poet whose pen was perhaps envenomed by a dread lest one day he himself might fall into the abyss and be swallowed up in this all-engulfing proletariat, like so many other *ci-devant* members of a Hellenic dominant minority.

Non possum ferre, Quirites,
Graecam urbem—quamvis quota portio faecis Achaei?
iampridem Syrus in Tiberim defluxit Orontes
et linguam et mores et cum tibicine chordas
obliquas necnon gentilia tympana secum
vexit et ad Circum iussas prostare puellas.
ite, quibus grata est picta lupa barbara mitra.
rusticus ille tuus sumit trechedipna, Quirine,
et ceromatico fert niceteria collo.
hic alta Sicyone, ast hic Amydone relictā,
hic Andro, ille Samo, hic Trallibus aut Alabandis,
Esquillas dictumque petunt a vimine collem—
viscera magnarum domuum dominique futuri.
ingenium velox, audacia perdita, sermo
promptus et Isaeo torrentior: ede, quid illum
esse putes? quemvis hominem secum attulit ad nos.
grammaticus, rhetor, geometres, pictor, aliptes,
augur, schoenobates, medicus, magus—omnia novit
Graeculus esuriens: in coelum miseris, ibit.
in summa non Maurus erat, nec Sarmata nec Thrax
qui sumpsit pennas, mediis sed natus Athenis.³

It is not the conquered barbarian nor even the Hellenized Oriental but the disinherited Hellene himself who is the most sordid representative of the Hellenic internal proletariat.

¹ For the fate of these slave-deportees, and their diverse reactions to the oppression which they suffered at the hands of the Hellenic dominant minority, see II. D (vi), vol. ii, pp. 213-16, above.

² Livy, Book IV, chap. 2, § 5.

³ Juvenal: *Satires*, No. III, ll. 60-80.

When we come to examine how these targets of satire and victims of injustice reacted to their fate, we shall not be surprised to find that one of their reactions was an explosion of savagery which surpassed in violence the cold-blooded cruelty of those conquerors, wastrels, and hangmen who first provoked them to revolt and then repressed them. It is only natural that the victims of a wanton and intolerable oppression should display a hotter passion in seeking revenge for injuries received than has been displayed by the aggressor in inflicting these injuries without provocation; and a uniform note of passion rings through a pandemonium of desperate proletarian outbreaks.

We catch this note in a series of Egyptian insurrections against the Ptolemaic régime of exploitation—an outbreak which began at the turn of the third and second centuries B.C., as soon as the Egyptian fallāhīn had acquired a stock of arms and *esprit de corps* and self-confidence as a result of the Ptolemaic Government's signal blunder of conscripting the natives into their army, alongside of the Macedonian colonists and the Greek mercenaries, in order to beat off a Seleucid invasion.¹ We hear the same note again in the more celebrated, and more momentous, series of Jewish insurrections against a Seleucid and a Roman policy of Hellenization²—an outbreak which began when Judas Maccabaeus took up arms against Antiochus Epiphanes in 166 B.C., and which was not quelled by the destruction of Jerusalem in the Great Romano-Jewish War of A.D. 66–70, but burst out again among the Jewish Diasporā in Cyrene and Egypt and Cyprus in A.D. 115–17,³ and among the Palestinian Jews in a last forlorn hope under the leadership of Bar Kōkabā in A.D. 132–5. It needed hardihood enough for the Palestinian Jews to defy the Seleucid Power in the twenty-fourth year after the Battle of Magnesia; for the loss of prestige which the Seleucid Monarchy had sustained through that defeat at Roman hands had hardly yet come to be felt in Asia Major, east of Taurus, and the latest local Seleucid feat of arms

¹ The newly conscripted native Egyptian phalangites in the Ptolemaic army won—and knew that they had won—the Battle of Raphia for Ptolemy IV Philopator against Antiochus III the Great in 217 B.C. For the part that may have been played by these Egyptian phalangites' mercenary comrades-in-arms in the evolution of the 'ideology' of the Hellenic internal proletariat see V. C (ii) (a), Annex II, vol. vi, pp. 496–500, below. See further Milne, J. G.: 'Egyptian Nationalism under Greek and Roman Rule' in *The Journal of Egyptian Archaeology*, vol. xiv, parts iii and iv (1928).

² For this lapse of Judaism into militancy see also IV. C (iii) (b) 12, vol. iv, pp. 224–5, above, and V. C (i) (d) 6 (δ), Annex, in the present volume, pp. 657–9, and V. C (i) (d) 9 (γ), vol. vi, pp. 120–3, below.

³ An account of this insurrection of the Jewish Diasporā in these three Roman provinces that had once constituted the Ptolemaic Empire will be found in Bell, M. I.: *Juden und Griechen im Römischen Alexandria* (Leipzig 1927, Hinrichs), pp. 36–40. Both the insurrection of A.D. 115–17 among the Diasporā and the insurrection of A.D. 132–5 in Palestine are dealt with in Lagrange, M.-J.: *Le Messianisme chez les Juifs* (Paris 1909, Gabalda), pp. 305–23.

in Coele Syria had been the triumphant conquest of the province from the Ptolemies in 198 B.C. In the second century before Christ the Maccabees' boldness was rewarded by a temporary military success; but nothing short of an invincible hatred was needed to nerve their successors, three hundred years later, to take up arms for a second and a third time against the omnipotence of Rome, when their first attempt to measure their strength against the Hellenic universal state had drawn upon them Titus's shattering blow. The same reckless fury also moved the semi-Hellenized and highly sophisticated natives of Western Asia Minor to expose themselves to Roman vengeance twice over: first in 132 B.C., when they joined the standard of the Attalid prince Aristonicus¹ upon hearing the appalling news that the last Attalus had bequeathed his kingdom to the Roman People; and for the second time in 88 B.C., when the cities opened their gates to Rome's rebel client-king Mithradates of Pontus, and the citizens took the opportunity to massacre the whole of the Italian business community—to a total, it was estimated, of 80,000 souls²—as a tardy revenge for the Roman filibustering expedition which had plundered Asia Minor, without provocation, just a hundred years before.

The rising of Aristonicus is the connecting link between the outbreaks of the subject Oriental peoples in the conquered provinces and the outbreaks of the imported slaves and the pauperized freemen in the homelands of the Hellenic Society. For slaves and 'mean freemen'³ fought side by side in Aristonicus's rebel band;⁴ and his rising was perhaps inspired by the news of the slave-revolt which had let loose the first of the two great slave-wars in Sicily (*gerebantur circa 135-131 B.C. et circa 104-100 B.C.*).⁵ These two Sicilian outbreaks were perhaps the largest in scale and the longest-drawn-out of the slave-revolts on the western plantations and ranches of the Hellenic World in the Post-Hannibalic Age,⁶ but they were neither the first nor the last of their kind, nor perhaps even the most savage. The series began, in the first decade after

¹ See IV. C (iii) (c) 3 (β), vol. iv, p. 507, above; and the present chapter and volume, pp. 179-80; V. C (i) (d) 6 (δ), Annex, p. 692, footnote 2; and V. C (i) (d) 11, Annex I, vol. vi, p. 351, below.

² Compare the similar wholesale massacre of the Italian business community in the East Roman Empire in A.D. 1183.

³ The phrase may be coined on the pertinent analogy of the 'Mean Whites' in the Southern States of the North American Union.

⁴ Strabo: *Geographica*, Book XIV, chap. 38, p. 646.

⁵ 'As the news' of the outbreak of the first Sicilian slave-war 'spread, slave-revolts flared up everywhere. At Rome a hundred and fifty persons entered into a conspiracy, in Attica over a thousand, and others in Delos and elsewhere.'—Diodorus of Agyrium: *A Library of Universal History*, fragments of Books XXXIV-XXXV, chap. 2, § 19. Delos, which was the principal slave-market of the Hellenic World in the second century B.C., was of course on the threshold of the Attalid Kingdom in Western Asia Minor, which was the theatre of Aristonicus's tragic adventure.

⁶ See III. C (i) (d), vol. iii, pp. 198-9, and IV. C (iii) (c) 3 (β), vol. iv, pp. 507-8, above.

the temporary restoration of peace between Rome and Carthage in 201 B.C., with an abortive conspiracy of the slaves of the Carthaginian hostages at Setia in 198 B.C.¹ and a rapidly suppressed slave-rising in Etruria in 196.² It was continued in a formidable insurrection of the slave-herdsmen in Apulia in 185;³ and, after a temporary shifting of the scene to Sicily, the climax was reached in the desperate exploit of the runaway Thracian gladiator Spartacus, who ranged up and down the length of the Italian Peninsula—defying the Roman wolf in his very lair—from 73 to 71 B.C.

While in Asia Minor, under Aristonicus's banner, the slaves and the 'mean freemen' made common cause, in Sicily these two wings of the local proletarian forces each went its separate way; and, of the two, it was not the Sicilian slaves, but the Sicilian paupers, who were the more revengeful and the more destructive.

'When Sicily was overtaken by these overwhelming disasters [in the first of the two slave-wars], the Free-Born Proletariat, so far from sympathizing with the victims [i.e. with the murdered slave-owners], actually exulted over them out of resentment at the existing inequalities of wealth and condition. This long-standing resentment was transformed from a painful into a gratifying emotion at the spectacle of magnificence reduced to the level of the misery upon which it had previously looked down with disdain. The most serious feature was that, whereas the [slave] insurgents, who took long and rational views, refrained from burning the farms or injuring the property and the stocks of agricultural produce which they found in them, and did not molest persons devoting their energies to work on the land, the social resentment of the Free Proletariat was, by contrast, so profound that they offered their services against the slaves simply as a pretext for going out into the country and not only pillaging property but burning farms.'⁴

The rancorous resentment against the Hellenic dominant minority which found this ugly vent was not confined to 'mean free' proletarians who were outside the pale of the Roman body politic. Their Roman fellow proletarians who were not only freemen, but were actually citizens of the city-state which was now politically omnipotent in the Hellenic World, were in the still more ironical position of being called 'the lords of the World' without having 'a single clod of earth to call their own', while for them the precious Roman citizenship, which gave their wealthy fellow citizens an invaluable economic 'pull', carried nothing with it but an obligation to 'go to the wars and sacrifice their lives for the sake of other men's wealth and luxury'.⁵ Thus the lot of a 'mean free'

⁵ Tiberius Gracchus, quoted by Plutarch in his *Lives of the Gracchi*, chap. 9 (see

pauper who had lost his freehold and had sunk to the position of a casual labourer on the land or an unemployed slum-dweller in the city was still less tolerable for a *togatus* than it was for a citizen of Centuripae or Pergamum; and the Roman pauper's feelings were proportionately bitter. The savagery with which the Roman citizen-proletariat turned and rent the Roman plutocracy in the civil wars, and particularly in the paroxysm of 91-82 B.C., was quite equal to the savagery of a Judas Maccabaeus or a Spartacus; and the most Satanic of all the dark figures that stand out in sinister silhouette against the glare of a world in flames are the Roman revolutionary leaders who had been flung headlong, by some unusually violent turn of Fortune's wheel, out of the *Ordo Senatorius* itself: a Sertorius and a Sextus Pompeius, a Marius and a Catiline.¹

In the desperate outbreaks of which we have given this summary catalogue, the Hellenic internal proletariat displayed a spirit like that of the Lacedaemonian underworld which hungered 'to eat' its Spartiate masters 'alive',² or like that of the Ottoman *ra'iyyeh* on Laconian ground who did succeed in wreaking their vengeance upon their Turkish masters in A.D. 1821, when they massacred every man, woman, and child of the dominant community in the captured fortress of Mistrà. In this spirit the outraged slaves of Dâmophilus repaid the monster in his own coin when at last they had him in their power; the Marians anticipated the worst excesses of the Sullans; and the ferocity of the Jewish Zealots³ was a match for the implacability of the Roman laws of war. In fact, in these orgies of ferocious violence the Hellenic internal proletariat went to the same lengths, in the same direction, as their oppressors the conquerors, wastrels, and hangmen in the Hellenic dominant minority; and this Shiva-like epiphany of the Proletariat, appalling though it may be, is not surprising, when we remind ourselves of the provocation to which it was a retort. It is, however, both

IV. C (iii) (c) 3 (β), vol. iv, p. 508, above, and V. C (i) (c) 1, Annex, in the present volume, p. 36, footnote 2, and V. C (ii) (a), Annex II, vol. vi, p. 381, Table VIII, logion (α), p. 414, below).

¹ See V. C (ii) (a), vol. vi, pp. 236-41, below.

² Xenophon: *Hellenica*, Book III, chap. 3, § 11, quoted in Part III. A, Annex III, vol. iii, p. 456, above.

³ Among the Jewish contingent in the Hellenic internal proletariat this spirit of unslaked vengeance found expression for itself in a special genre of literature: the Apocalypse. This genre was in vogue for nearly three centuries, if the critics are right in dating the composition of the Book of Daniel circa 166-164 B.C. and that of the Revelation of Saint John the Divine circa A.D. 93-5. Fragments of an Egyptian apocalypse, closely corresponding to the Jewish Book of Daniel in both content and construction, have now been discovered by our modern Western archaeologists. This Egyptian work seems, like its Jewish counterpart, to have been composed immediately after the local outbreak of the militant Anti-Hellenic revolt of the Proletariat, and, as we have noticed on p. 68, above, this broke out in Egypt some fifty years earlier than in Judaea. It is thus chronologically possible that the Book of Daniel may have been a Jewish copy of an Egyptian prototype (see Meyer, E.: *Ursprung und Anfänge des Christentums*, vol. ii (Stuttgart and Berlin 1921, Cotta), pp. 187-8).

astonishing and admirable to find that this was not the only response which was evoked from the Hellenic internal proletariat by the tremendous challenge to which it was subjected. There was also an antiphonal response which was at the opposite extreme of the spiritual gamut; and at this other extremity the internal proletariat not merely attained, but rose far above, the spiritual level which was reached by the altruists in the dominant minority—spurred though these altruists were by pricks of conscience which the proletarians had no occasion to feel, and equipped though they also were with intellectual resources that were quite beyond the proletarians' ken.

We find, in fact, that the outbreaks of violence which we have been recording hitherto were seldom or never the only reactions of the momentary victims to the momentary ordeal. While some of the victims were usually moved to respond to oppression by resorting to force on their own part, there were usually others who met force not by counter-force but by gentleness.¹ Even the frenzied slaves of the monster Dāmophilus had at least the humanity to refrain, in the flood-tide of their vengeance, from returning evil for good—as they showed by the pains that they took to save Dāmophilus's tender-hearted daughter when they were dragging to their deaths the tormenter himself and his equally inhuman wife.² In the semi-legendary Jewish recollections of the ordeal which the Palestinian Jewry had to meet in resisting Antiochus Epiphanes' policy of Hellenizing them by force, the passive resistance, under torture and unto death, of the old scribe Eleazar and of the Seven Brethren and their Mother³ precedes, in the narrative, the militant resistance of the mighty man of valour Judas Maccabaeus.⁴ In the story of the Passion of Jesus the leader's injunction to his companions—'he that hath no sword, let him sell his garment and buy one's—'is immediately followed by his 'it is enough' when two

¹ For the ambiguity of this term as it is used in this chapter see V. C (i) (c) 2, Annex III, pp. 588–90, below.

² [Dāmophilus and his wife Megallis] had a young unmarried daughter of a particularly unspoiled and humane disposition, who invariably did her utmost to intercede for slaves sentenced by her parents to floggings, and to relieve those in chains. Her goodness had won her an intense and universal affection, and on this terrible occasion the gratitude which she had earned enlisted on her behalf the better feelings of her former protégés. No one ventured to lay a violent hand upon her, and her honour was scrupulously respected by all concerned. The most efficient members of the band . . . were detailed to escort her to some relatives at Catana. . . . This was a demonstration that the treatment meted out to the others was not the expression of any innate barbarity in the slaves, but was simply retribution for the wrongs which had previously been inflicted upon them.—Diodorus of Agyrium: *A Library of Universal History*, fragments of Books XXXIV–XXXV, chap. 2, §§ 39 and 13.

³ In Eduard Meyer's view (*Ursprung und Anfänge des Christentums*, vol. ii (Stuttgart and Berlin 1921, Cotta), p. 161, footnote 2, the latter of these two stories is fabulous but the former substantially historical.

⁴ 2 Maccabees, chaps. vi–vii, in contrast with the remainder of the book.

⁵ Luke xxii. 36.

swords only are forthcoming among all the twelve;¹ and this perfunctory call to arms is finally stultified by the leader's own deliberate refusal to fight when he is on the point of being arrested. At that crucial moment, 'when they which were about him saw what would follow, they said unto him: "Lord, shall we smite with the sword?" And one of them smote the servant of the High Priest and cut off his right ear. And Jesus answered and said: "Suffer ye thus far." And he touched his ear and healed him.'² In the next chapter of the same story the behaviour of Jesus's Apostles, who boldly and obstinately refuse to obey the injunction not to preach, yet offer no physical resistance to the arm of the law, makes a deep impression upon the famous doctor Gamaliel, whose keen eye instantly perceives the striking contrast which the Apostles' behaviour presents to the conventional militancy of the contemporary epigoni of Judas Maccabaeus.

'Ye men of Israel, take heed to yourselves what ye intend to do as touching these men. For before these days rose up Theudas, boasting himself to be somebody, to whom a number of men, about four hundred, joined themselves—who were slain, and all, as many as obeyed him, were scattered and brought to naught. After this man rose up Judas of Galilee, in the days of the taxing, and drew away much people after him. He also perished; and all, even as many as obeyed him, were dispersed. And now I say unto you: Refrain from these men and let them alone. For if this counsel or this work be of men, it will come to naught; but if it be of God, ye cannot overthrow it—lest haply ye be found even to fight against God.'³

Here are two responses to an identic challenge which are not only different but are actually contradictory and incompatible. The gentle response is as genuine an expression of the Proletariat's will to secede as the violent response is; for the gentle martyrs who are commemorated in the Second Book of Maccabees are the spiritual progenitors of the Pharisees, and the Pharisees are 'they who separate themselves'⁴—a self-conferred title which would trans-

¹ Luke xxii. 38. For the origin of this incident see V. C (ii) (a), Annex II, vol. vi, p. 528, below.

² Luke xxii. 49-51. See V. C (ii) (a), Annex II, vol. vi, pp. 392 and 527-8, below.

³ Acts v. 35-9. For the movement of which this Theudas and Judas were representatives, see Lagrange, M.-J.: *Le Messianisme chez les Juifs* (Paris 1909, Gabalda), pp. 10-27; Meyer, E.: *Ursprung und Anfänge des Christentums*, vol. ii (Stuttgart and Berlin 1921, Cotta), pp. 402-6; von Gall, A.: *Βασιλειαν Θεού* (Heidelberg 1926, Winter), pp. 375-6. As a matter of history, Theudas' insurrection was not precedent to Judas', but was subsequent both to it and to the date (*circa* A.D. 30) at which, in the Acts of the Apostles, Gamaliel's speech is represented as having been delivered.

⁴ The Greek word *Φαρισαῖοι* represents the Aramaic 'Perishaye'. According to Meyer, E.: *Ursprung und Anfänge des Christentums*, vol. ii (Stuttgart and Berlin 1921, Cotta), p. 284, the most probable explanation of the name is that 'it sprang from some particular political occasion, in fact from the events of the year 163 B.C., in which the Pharisees did separate themselves from their previous allies, the followers of Judas [Maccabaeus]. In etymology and history alike, the Pharisees are reminiscent of the Kharijites, i.e. "the Withdrawers", who, in the civil war between 'Ali and Mu'awiyah, renounced their allegiance to 'Ali and withdrew from his camp, because their religious

late itself into 'secessionists' or 'schismatics' in the official language of an Antiochus and a Titus—or indeed of a Jannaeus and a Herod. Here are two alternative ways of shaking the dust of the agora and the arena off the puritan's feet; but both ways cannot be followed at once; and in the history of the Oriental proletariat of the Hellenic World from the second century B.C. onwards we see Violence and Gentleness striving for the mastery of souls, until Violence annihilates itself and leaves Gentleness alone in the field.¹

The issue was raised at the outset; for the gentle way which was taken by the protomartyrs of 167 B.C. was swiftly abandoned by the impetuous Hasmonaeans; and this proletarian 'strong man armed's' immediate material success—tawdry and ephemeral though it was—so dazzled Posterity that Jesus's most intimate companions were scandalized at their Master's own predictions of his fate, and were prostrated when these predictions came true. At the first warning, Peter² began to rebuke him—'saying: "Be it far from thee, Lord. This shall not be unto thee"'³—and at the hour of decision the same Apostle was so demoralized by the order to put up his sword again into his place, after he had just struck the first and last physical blow in the conflict, that he actually perpetrated the thrice repeated denial of his Master which, a few hours before, he had indignantly scouted, as something quite incredible, when he had been warned that this was how he would behave. 'Though I should die with thee, yet will I not deny thee'; and 'likewise also said all the disciples'.⁴ Yet, as soon as Jesus ordered Peter to sheathe his sword, 'then all the disciples forsook him, and fled'.⁵ The way of Gentleness seemed to be confuted once for all in the crucified Jesus—'unto the Jews a stumbling-block, unto the Greeks foolishness'⁶—yet a few months after the Crucifixion Gamaliel was already taking note of the executed leader's miraculously rallied disciples as men who might prove to have God on their side; and a few years later Gamaliel's own disciple Paul was preaching a crucified Christ.

This vastly painful but infinitely fruitful conversion of the first generation of Christians⁷ from the way of Violence to the way of

scruples made them reject both the two opposing claimants as criminals from whom they wished to keep the cause of Islam clear and uncontaminated'. For the subsequent conflicts between the Pharisees and the Hasmonaeans see Meyer, *op. cit.*, vol. cit., pp. 306–11.

¹ See V. C (i) (c) 2, Annex III, pp. 588–90, below.

² Peter's slow conversion from the way of Violence to the way of Gentleness is discussed further in V. C (i) (d) 1, pp. 392–3, below.

³ Matt. xvi. 21–6; xvii. 22–3; xx. 17–28, with the corresponding passages in the other two Synoptic Gospels.

⁴ Matt. xxvi. 35.

⁵ Matt. xxvi. 56.

⁶ 1 Cor. i. 23 (see V. C (i) (d) 11, vol. vi, pp. 150 *seqq.*, below).

⁷ The earliest direct evidence for this conversion is to be found in the canonical epistles of the New Testament. For the relevant passages, exhorting slaves to obey their masters and subjects to obey their rulers, see V. C (i) (c) 2, Annex III, p. 590, below.

Gentleness had to be purchased at the price of a shattering blow to their material hopes; and what was done for Jesus's followers by the Crucifixion was done for Orthodox Jewry by the destruction of Jerusalem in A.D. 70. By that time Christianity had spread beyond the bounds of Palestine so far and wide among the internal proletariat of the Hellenic World that the infant church was in no danger of being overwhelmed by the annihilating catastrophe which now overtook its homeland. In A.D. 70 the Jewish Christian Church in Jerusalem was already eclipsed by the Greek Christian Church in Antioch, the former capital of the Hellenizing Seleucids. But the warning, placed in Jesus's mouth in the Synoptic Gospels,¹ that the Christians in Judaea should flee into the mountains when they saw 'the abomination of desolation'—Hellenic paganism in arms—reappearing on the Palestinian horizon, was spontaneously and unwittingly obeyed by at least one orthodox Jewish doctor.

Before the net of the Roman circumvallation finally closed in upon the devoted Holy City, Rabbi Johanan ben Zakkai independently took the momentous decision to break with the tradition of militancy which Judas Maccabaeus had inaugurated. Eluding the vigilance of the Jewish Zealots, he slipped across no-man's-land and prevailed upon the Roman High Command to let him through in order that he might quietly continue his teaching out of earshot of the battle; and, when the tidings of the inevitable catastrophe eventually reached him in the Hellenized Philistine township of Jabneh,² where he had reassembled his school, and the disciple who brought the bad news exclaimed in anguish: 'Woe to us, because the place is destroyed where they make propitiation for the sins of Israel', the master answered: 'My son, let it not grieve thee; we have yet one propitiation equal to it, and what is that but the bestowal of kindnesses?—even as it is written "I desired kindness and not sacrifice"'.³ In act and word Johanan ben Zakkai was proclaiming his conversion from the way of Violence to the way of Gentleness; and through this conversion he became the founder of a new Jewry which has survived—albeit only as a fossil⁴—in all manner of alien and inclement environments down to the present day, and which shows no signs of succumbing to its present tribulations. The secret of this latter-day Jewry's extraordinary survival power lies in its persistent cultivation of the *éthos* which Johanan ben Zakkai has bequeathed to it. After the lessons of

¹ Matt. xxiv. 15-28 = Mark xiii. 14-23 = Luke xxi. 20-4.

² *Hellenic Jamnia*.

³ Burkitt, F. C.: *Jewish and Christian Apocalypses* (London 1914, Milford), p. 8, footnote 1, and Lagrange, M.-J.: *Le Messianisme chez les Juifs* (Paris 1909, Gabalda), p. 302, both quoting from *Aboth de R. Nathan*, ch. 4.

⁴ For Jewry as a fossil see I. B (iii), vol. i, p. 35; I. C (i) (b), vol. i, pp. 90-2; II. D (vii), vol. ii, pp. 285-6, above.

A.D. 70 and 135¹ a new school of Judaism renounced 'the notion that the Kingdom of God was an external state of things which was just upon the point of being manifested'.² With the signal but solitary exception of the Book of Daniel, the apocalyptic writings in which the Jewish way of Violence had found literary expression since the days of Antiochus Epiphanes were now ejected from the canon of the Law and the Prophets;³ and the contrary principle of abstaining from all attempts to promote the fulfilment of God's will in This World by the work of human hands has become so fast ingrained in the Jewish tradition that the strictly orthodox *Agudath Israel* at this day look askance at the Zionist movement and are holding rigidly aloof from any participation in the work of building up a material Jewish 'national home' under a British mandate in post-war Palestine.⁴

If this change of heart in Orthodox Jewry since the destruction of Jerusalem in A.D. 70 has enabled Jewry to survive as a fossil, the corresponding change of heart in the companions of Jesus after the Crucifixion has opened the way to greater triumphs for the Christian Church. The Christians had come unscathed out of the local catastrophe which the militancy of the Jewish Zealots had brought upon Jewry; and, although the Christian Faith was soon officially proclaimed a *religio non licita*, the Imperial Government's standing policy during the first two centuries of the Christian Era was not to force the issue.⁵ Accordingly, during this 'Indian Summer' of the Hellenic Civilization's decline, the persecutions which the Christians had to suffer were intermittent and sporadic; and the Church was not summoned to drink the cup, or to be baptized with the baptism, of its Founder and Master⁶ till the third century, when the whole Hellenic World relapsed into the Ishmaelitic state of anarchy that had afflicted it during the last two centuries B.C.,⁷ and when a Decius and a Valerian and a Diocletian set out to deal with an oecumenical Christian Church⁸ as an Antiochus Epiphanes had dealt in the second century B.C. with the local Jewish community in Judaea. To this challenge the Christian Church responded in the gentle way of Eleazar and the Seven

¹ The failure of Bar Kōkabā (see p. 68, above) confirmed the victory of Johanan ben Zakkai's school (von Gall, A.: *Bavileia tou Θεου* (Heidelberg 1926, Winter), pp. 279-80).

³ Burkitt, op. cit., p. 9.

⁴ For the *Agudath Israel* see Leonard Stein in Toynbee, A. J.: *Survey of International Affairs*, 1925, vol. i (London 1927, Milford), pp. 376-7. For the deeper difference of attitude that underlies the superficial agreement between the *Agudath Israel* and the school of Johanan ben Zakkai on the negative point of Non-Violence, see Annex III to the present chapter, pp. 588-9, and V. C (i) (d) 9 (y), vol. vi, pp. 127-8, below.

⁵ For the variations in the application of the Roman Government's policy towards the Christian Church in this age see V. C (i) (d) 6 (α), in the present volume, pp. 456-7, and V. C (ii) (a), vol. vi, pp. 201-2, below.

⁶ Matt. xx. 22.

⁷ See IV. C (i), vol. iv, p. 8, footnote 2, above, and V. C (ii) (a), vol. vi, pp. 205-6, and V. C (ii) (b), vol. vi, p. 291, below.

⁸ See V. C (i) (d) 3, pp. 407-9, below.

Brethren, and not in the violent way of Judas the Hammer; and its reward was the conversion of the Hellenic dominant minority. In the next ordeal, which came at the turn of the fourth and fifth centuries when the converted Roman Empire broke up, the Church responded once again in its traditional fashion; and this time its reward was the conversion of the barbarian war-bands with whom it found itself face to face in the fallen Empire's derelict Western provinces.¹ In an age in which the hollow futility of the secular *Fasti Triumphales* engraved in stone on the Capitol was being mercilessly exposed by the ultimate military and political bankruptcy of the Roman body politic, the Church was given the opportunity to celebrate some of the most astonishing of the triumphs of Christian Gentleness. Through this power which worked so mightily upon the men of violence, just because it was of a different order from the force which they exercised and understood, we see a Pope Leo turning back an Attila from his march on Rome when he had already reached the banks of the Mincio from the banks of the Danube and had demonstrated upon Rome's daughter Aquileia the atrocities which he intended to inflict upon Rome herself. We see a Saint Severinus coming to the rescue of Upper Danubian provinces that had been deserted by the Imperial Army and the Imperial Civil Service, and going about his Master's business—defenceless, intrepid, and unscathed—*inter gladios barbarorum*: making Gibuld king of the Alemanni tremble in his presence as he had never trembled in battle; deterring Fera king of the Rugians from carrying into captivity the refugees of Lauriacum; and giving his blessing to the young Odovacer.² And we hear the voice of a Saint Remi answering a Clovis' request for baptism with his 'Mitis depone colla, Sicamber'.³

Thus in the spiritual history of the Hellenic internal proletariat we see the two incompatible spirits of Violence and Gentleness

¹ See I. B (iv), vol. i, pp. 40-1, above. This victory of the Christian Church over the barbarian war-bands during the post-Hellenic interregnum was not won in every part of the field. While in the Western provinces the barbarian intruders were duly converted from the Arianism and the paganism that they had brought in with them (see V. C (i) (c) 3, pp. 227-33, below), the outcome, as we have seen, was different in the Greek and Oriental provinces. In the Greek provinces the barbarians were successfully kept at bay, first by a prolongation of the Empire's life and afterwards by its artificial resuscitation; and the Church was then turned into a department of state by the civil power of the East Roman *Imperium Redivivum* (see IV. C (iii) (c) 2 (β), vol. iv, pp. 346-53, with Annex II, above). In the Oriental provinces the Catholic Christianity which overcame the Arian heresy of the Goths and Lombards in the West was overcome by the Muhammadan heresy of the Arabs, because the 'successor-state' of the Roman Empire in these provinces, which had been established by the Primitive Muslim Arab barbarian invaders, was quickly called upon to play the quite different role of re-establishing the social unity of the Syriac World within the political framework of a 're-integrated' Syriac universal state which took up the interrupted work of the Achaemenian Empire (see I. C (i) (b), vol. i, pp. 73-8, above).

³ Gregory of Tours: *Historia Ecclesiastica Francorum*, Book II, chap. 31.

perpetually struggling with one another, and Gentleness,¹ with the aid of Experience (*πάθει μάθος*),² gradually and painfully gaining the upper hand.

As soon as we grasp the plot of this 'post-classical' Hellenic drama, we see that it is not played exclusively on the proletarian stage; for there are at any rate hints of it in the spiritual history of the Hellenic dominant minority as well. The contrast between an Eleazar the Scribe and a Judas the Hammer, or between a Jesus who dies on the Cross and a contemporary Theudas and Judas who perish with the sword, has its analogue in the contrast between the gentle King Agis and the violent King Cleomenes in the third century B.C. at Sparta, or between the gentle Tribune Tiberius Gracchus and the violent Tribune Gaius Gracchus³ in the second century B.C. at Rome. The recalcitrance of Peter against Jesus's superhuman resignation to the prospect of being wrongfully put to death is anticipated, in the generation of the breakdown at Athens, in Crito's attempt—less brusque in manner than Peter's but not less naïve in essence—to persuade Socrates to allow himself to be smuggled out of the prison where he is lying under a death-sentence that he has not deserved. Again, the victory of Gentleness over Violence in the souls of a Peter and a Paul and a Johanan ben Zakkai has its parallels in the vision of an Alexander⁴ and in the clemency of a Caesar⁵ and in the penitence of an Augustus.⁶

These eight famous representatives of the Hellenic dominant minority whose names have just been called to mind by the analogies which they present, in their actions and in their *êthos*, with as many famous representatives of the Hellenic internal proletariat, include, in the Athenian Socrates, the father of all the schools of Hellenic philosophy,⁷ and, in the Roman Augustus, the founder

¹ See V. C (i) (c) 2, Annex III, pp. 588-90, below.

² Aeschylus: *Agamemnon*, line 177, quoted in I. C (iii) (b), vol. i, p. 169, footnote 1; II. C (ii) (b) 1, vol. i, p. 298; IV. C (iii) (b) 11, vol. iv, p. 218; and IV. C (iii) (c) 3 (β), vol. iv, p. 584, above; and in V. C (i) (d) 4, in the present volume, p. 416, footnote 3, and V. C (ii) (a), vol. vi, p. 275, below.

³ In the extant portrait of Gaius Gracchus there are some incongruous traits which testify to a different presentation in which Gaius, instead of serving as a violent foil to a gentle hero in the person of his brother Tiberius, was himself cast for the gentle part, and was provided with a violent foil in the person of Marcus Fulvius Flaccus. Conversely, in the extant portrait of Jesus, there are traces of a different presentation in which he was cast for the violent part and not for the gentle one (see V. C (ii) (a), Annex II, vol. vi, p. 378, below).

⁴ See V. C (i) (d) 7, vol. vi, pp. 6-10, and V. C (ii) (a), vol. vi, p. 254, below.

⁵ Caesar's tardy clemency could not, of course, repair the damage that had previously been inflicted upon a miserable world by his pertinacious and devastating ambition. For the toll taken by Caesar's militarism in Gaul see Conway, R. S.: *Makers of Europe* (Cambridge, Mass. 1931, Harvard University Press), pp. 15-16; for the toll taken by it in the civil war between Caesar and the Roman Republicans see the present study, V. C (i) (a), vol. vi, pp. 186-7, below.

⁶ See V. C (i) (d) 5, p. 435, V. C (i) (d) 6 (δ), Annex, p. 648, and V. C (ii) (a), vol. vi, p. 187, below.

⁷ Philosophy in contrast to Physical Science—a study which had been pursued in

of the Hellenic universal state. These two great creative works of the Hellenic dominant minority are monuments, as we have seen,¹ of the labours of the altruists whom this minority bred at the opposite extreme of the spiritual gamut from its conquerors and wastrels and hangmen. If it is true, as we have suggested, that the Hellenic internal proletariat not only matched the destructiveness of these three villainous dominant types with its own proletarian brood of rebels and avengers, but also, at the opposite extreme, rose far above the spiritual level of the altruists, then we must look for signs of this higher attainment in the shape of proletarian creative works which correspond to the schools of philosophy and to the universal state but surpass these in fruitfulness as well as in sublimity; and we shall not look for these signs in vain; for the things that we are seeking stare us in the face. Among the works of the Internal Proletariat the counterparts of the philosophies are 'higher religions',² while the counterpart of the universal state is a universal church.³

Hellas since the days of Thales, more than a century before Socrates' time, and which had been consciously and deliberately abandoned by Socrates himself in his youth (see III. C (i) (c), vol. iii. pp. 186-7, and V. C (i) (c) 1, in the present volume, p. 39, footnote 2, above.

¹ In V. C (i) (c) 1, pp. 38-40, above.

² The religions which arise, during the disintegrations of civilizations, within the bosoms of internal proletariats constitute a distinct species within the genus; and some specific name has to be found to distinguish them from the primitive religions which hold the field, not only in the primitive societies, but also in those civilizations which—like the Hellenic Civilization itself—are not affiliated to an antecedent civilization through an internal proletariat, but are either affiliated through an external proletariat or else are derived from some primitive society direct, through a mutation (for the alternative ways in which a civilization may arise, see I. C (ii), vol. i, and Part II. A, vol. i, above). In contrast to the primitive religions, it seems legitimate to distinguish the religions discovered by internal proletariats as 'higher religions'; for a primitive religion is merely one expression, among many, of the corporate life of some local human community, whereas a 'higher religion' is the worship of a Godhead that is conceived of as transcending the whole of human life as well as the whole of the Material Universe. Our term, however, would probably be contested, as question-begging, by the devotees of Shinto in contemporary Japan and of the 'Nordic' Neo-paganism in contemporary Germany, who would agree with one another in holding that the tribe is the tribesman's spiritual absolute, and that therefore the worship of the tribe is the highest form of religion that a human being can have. This is, perhaps, the most crucial question that our Western Society will have to answer in our generation. (The difference between the two kinds of religion here in question has been pointed out by Monsieur Henri Bergson in *Les Deux Sources de la Morale et de la Religion* (Paris 1932, Alcan), p. 198: 'La première forme de la religion avait été infra-intellectuelle...; la seconde fut supra-intellectuelle. C'est en les opposant tout de suite l'une à l'autre qu'on les comprendrait le mieux'.)

³ Of course this analogy, like all analogies, reveals no more than a likeness-in-difference. The 'higher religions' do resemble the philosophies in being attempts to find a new way of spiritual life to replace a lost or ruined spiritual heritage; and universal churches do resemble universal states in being social institutions that are constructed in order to gather together under the common shelter of a single roof the scattered children of a society that is far gone on the road from breakdown towards dissolution. There is also, up to a point, an analogy in the relation between each of the two ways of life and the respective social institution that goes with it; for, if the Catholic Church is inconceivable without Christianity, it would also not be difficult to show that Augustus could never have founded the Roman Empire if Socrates and Plato and Antisthenes and Zeno and Epicurus had not previously inoculated with their philosophies the souls of that dominant minority from which Augustus eventually recruited his public servants. At this point, however, the analogy gives out; for this relation between Greek philosophies and the Roman Empire was, in spite of its importance, imperfect. The Roman

In the Hellenic case in point the universal church was the Catholic Christian Church (which became the official church of the Hellenic universal state in the course of the fourth century of the Christian Era);¹ and the victorious 'higher religion' was the Christianity which the Catholic Church embodied. But while there was not—and could not be—more than one church that won its way to universality in the single social field of the Hellenic World, the victorious religion was victor over a bevy of discomfited competitors.

The direct opponent of Christianity was the primitive tribal religion of the Hellenic Society in its latest guise: the idolatrous worship of the Hellenic universal state in the personality of a Divus Caesar or in the abstraction of a Dea Roma.² It was the Church's gentle but intransigent refusal to allow its own members to practise this idolatry, even in a merely formal and perfunctory way, that drew upon it a series of official persecutions and finally compelled the Roman Imperial Government to capitulate to a spiritual power which it had failed to coerce.³ But, though this primitive state-religion of the Roman Empire was maintained and imposed with the whole strength of the Imperial Government's right arm, it had little hold over human hearts.⁴ The conventional respect for it which the Roman magistrate commanded the Christian to show by the performance of an outward ritual act was the beginning and end of this state-religion. There was nothing more in it than this

Empire was not created by Augustus, *de toutes pièces*, for the express purpose of embodying his *Pax Augusta*. It was an historic 'going concern' which he had to take as he found it and to adapt as best he could to his own ends; and the Augustan adaptation was a *tour de force*, for this Roman Empire which was turned by Augustus into an instrument of Peace was actually the child of War: the offspring of 'knock-out blows' which one of the five Great Powers of a post-Alexandrine Hellenic World had dealt to the other four. The reason why the *Pax Augusta* eventually broke down was because the Empire was never quite purged of its original sin of Militarism (see V. C (ii) (a), vol. vi, pp. 197-8, below). The dutiful civil servants and soldiers who kept the Empire in being as an instrument of the Augustan Peace were the heirs of those conquerors and wastrels and hangmen who had cleared the ground for it by razing a multitude of older and finer buildings; and these ancestors' criminal impulses sometimes broke out again, disconcertingly and disastrously, in the souls of their contrite successors. The spiritual union between Greek philosophy and Roman imperialism was never complete—not even when the Imperial throne was occupied by a Marcus or a Julian. The measure of the unresolved discord is given by the manifest spiritual discomfort of each of these two philosopher-kings. This unsatisfactory relation between Stoicism or Neoplatonism, as the case may be, and the Roman Empire is utterly different from the relation between Christianity and the Church; for, although the Church may actually never yet have expressed Christianity to perfection, there is at least no inherent impediment here to the attainment of a perfect harmony, since the Church has been called into existence for this purpose and for no other.

¹ The official establishment of the Catholic Church in the Roman Empire was a gradual process, which was begun by Constantine the Great (*imperabat* A.D. 306-37) and was completed by Theodosius the Great (*imperabat* A.D. 378-95), after an Arian interlude under Constantius II (*imperabat* A.D. 337-61) and a pagan reaction under Julian (*imperabat* A.D. 361-3).

² See I. C (iii) (e), Annex, vol. i, p. 443, above, and V. C (i) (d) 6 (δ), Annex, in the present volume, pp. 648-50, below.

³ See IV. C (iii) (c) 2 (β), vol. iv, pp. 347-9, above.

⁴ See V. C (i) (d) 6 (δ), Annex, vol. vi, pp. 648-50, below.

for those non-Christian citizens of the Empire who performed as a matter of course what was demanded and who could not understand why the Christian insisted upon sacrificing his life rather than comply with a trivial custom. The rivals of Christianity which were formidable in themselves—through a native power of attraction which needed no backing of coercive political force—were neither this state-worship nor any other form of primitive religion, but a number of rival 'higher religions' which sprang, like Christianity itself, from the Hellenic internal proletariat.¹

We can conjure these rival 'higher religions' up by reminding ourselves of the various sources from which the Oriental contingent in the Hellenic internal proletariat was derived. The Christian religion was a contribution from a submerged Oriental people of Syriac antecedents: the Jewish community whose home was in Coele Syria. Syria, however, as we have seen, was only a fraction of the Syriac World in its ultimate extension. We have observed in other contexts how, as an accidental consequence of its breakdown and disintegration, the Syriac World eventually came to embrace Iran.² Did the Iranian as well as the Syrian wing of a thus expanded Syriac Society contribute a 'higher religion' to the Hellenic internal proletariat? The question is answered in the affirmative in the rise and spread of Mithraism, which was an Iranian-born counterpart of a Syrian-born Christianity. This Mithraism was not only Christianity's next of kin: it was also perhaps the most potent of all the 'higher religions' with which Christianity had to compete. The weaker competitors were all alike non-Syriac,³ though they were diverse in genius and in origin. The worship of Isis was contributed⁴ by the submerged northern half of the Egyptian World.⁵ The worship of the Anatolian Great Mother Cybele may perhaps be regarded as a contribution from a Hittite Society which by this time had long been extinct on every plane of social activity except the religious⁶ (though, if we set ourselves in earnest to trace the Great Mother back to her ultimate

¹ See II. D (vi), vol. ii, pp. 215-16, above.

² See I. C (i) (b), vol. i, pp. 79-82; II. D (v), vol. ii, pp. 137-8; III. C (i) (a), vol. iii, pp. 140-1, above.

³ For the question whether Manichaeism—which was another Syriac 'higher religion' of partly Iranian origin—has to be reckoned among the competitors of Christianity for the conquest of the Hellenic World, or whether, on the other hand, it has to be classed with Nestorianism and Monophysitism as one of several alternative attempts to purge a Syro-Hellenic religious syncretism of its Hellenic alloy, see the present chapter, p. 127, footnote 4, with Annex I, pp. 575-80, below.

⁴ Isis proved strong enough to insist upon being given legal domicile in Rome, in spite of a strenuous and long-sustained resistance on the part of the public authorities, in the course of the half-century ending in 43 B.C. (Seeck, O.: *Geschichte des Untergangs der Antiken Welt*, 2nd edition, vol. iii (Stuttgart 1921, Metzler), pp. 125-6).

⁵ For the permanent political partition of the Egyptian World, from the seventh century B.C. onwards, at the line of the First Cataract, see II. D (v), vol. ii, pp. 116-17, above.

⁶ For the Hittite Society and its early death see I. C (i) (b), vol. i, pp. 110-15, and IV. C (ii) (b) 2, vol. iv, pp. 108-12, above.

origins, we shall find her originally at home in the Sumeric World under the name of Ishtar,¹ before ever she established herself as Cybele at Pessinus² or as the Dea Syra at Hierapolis or as the Mother Earth of remote Teutonic-speaking worshippers at her grove on a Holy Island in the North Sea or the Baltic³).

A Minoan Lacuna and some Hittite Vestiges.

Having now studied the genesis of one internal proletariat, and taken an inventory of its works,⁴ in the concrete example that is

¹ See I. C (i) (b), vol. i, p. 112, footnote 2, above.

² For the translation, in 204 B.C., from Pessinus to Rome, of the black stone in which the numen of the Pessinuntine Cybele was lodged, see Livy, Book XXIX, chaps. 10, 11, and 14, and the present Study, V. C (i) (d) 6 (δ), Annex, pp. 685-8, below.

³ For a description of this distant emanation of the worship of Cybele-Ishtar see Tacitus: *Germania*, chap. 40. For the radiation of the worship of Ishtar from a Sumeric centre see the present chapter of this Study, pp. 147-52, below.

⁴ The reader will have noticed that the worship of the Sun has not been mentioned in our catalogue of 'higher religions' arising in the bosom of the Hellenic internal proletariat, while the worships of Cybele, Isis, and Mithra, as well as Christianity, have been included. The omission has been deliberate; for the revolutionary cult of *Ἡλιος ἐλευθέριος*, which can be detected in the romance of Iambulus and in the *émeute* of Aristonicus (see the present chapter, pp. 69 and 179-80, and V. C (i) (d) 6 (δ), Annex, p. 692, footnote 2; and V. C (i) (d) 11, Annex, vol. vi, p. 351, below), seems to have been stamped out in the repression of the internal proletariat's abortive attempts to make a social revolution in the last phase of the Hellenic 'Time of Troubles', while the would-be conservative cult of Sol Invictus that is so prominent in the religious history of the Hellenic World in the third century of the Christian Era was not one of those popular religions that the internal proletariat discovered for itself. It was in a different category from the other Oriental 'higher religions', and in the same category as the Oriental philosophy of Astral Determinism (see V. C (i) (c) 1, pp. 56-7, above), by reason of the facts that it was an abstract and artificial religion; that its discoverers and devotees were members of the dominant minority; and that it was propagated from above downwards and not from below upwards. This was the nature and history of the Sun-worship that was affected by Aurelian and by Constantius Chlorus—and also by Constantius's son Constantine the Great until he abandoned Sol for Christ (see Baynes, N. H.: *Constantine the Great and the Christian Church* (London 1929, Milford), pp. 8 and 95-103). This Hellenic Imperial cult of Sol Invictus in the latter part of the third century of the Christian Era is strictly analogous to the Egyptian Imperial cult of the Solar Disk which was invented by Ikhnaton (and the parallel is an admirable illustration of that uniformity of human nature which sometimes produces surprisingly similar results in similar situations where there can be no suspicion of any connecting link of historical tradition). The third-century Roman Emperors—convinced, by the harrowing experience of their generation, that political institutions required spiritual sanctions and that 'philosophy' was 'not enough'—were now attempting to re-inforce the official Caesar-worship, which was coeval with the Empire itself, and the unofficial Stoic philosophy, on which their own immediate predecessors in the second century had managed to live, with a semi-official Solar religion which was (they fondly hoped) to become a religious link between the dominant minority of the Hellenic World and a now once again militantly hostile proletariat. This artificial religious policy failed—as it was bound to fail—because it had nothing substantial to offer to either of the two parties to whom it was addressed. For the dominant minority Sol Invictus could not provide the 'spiritual vitamins' (if the phrase may be allowed) which Zeno had failed to give them, while for the proletariat the offer of Sol Invictus in place of Magna Mater or Isis or Mithras or Christ was the offer of a stone for bread. In a later chapter of this Study (V. C (i) (d) 6 (δ), Annex, pp. 649-50 and 691-4, below) we shall observe that the fiasco of the cult of Sol Invictus, like the fiasco of Atonism, is an example of a general 'law' to the effect that, while a 'higher religion' can be discovered by an internal proletariat and be communicated by it to a dominant minority, an attempt to reverse the direction of the movement condemns this spiritual commerce to sterility and frustration.

The cult of Sol Invictus must, of course, be distinguished from an entirely different form of Sun-worship which a third-century Roman Emperor of an earlier generation had attempted to thrust upon his subjects by an abuse of political power that presents a sharp contrast to the tact and moderation of his successors who were advocates of Sol Invictus. This other Solar religion was the historic local Sun-worship of the Syrian

offered by the history of the disintegration of the Hellenic Civilization, let us do again what we have done in our foregoing study of dominant minorities. Let us test, by making a survey, whether the phenomena which have thus presented themselves in a single case are unique and therefore of little account or regular and therefore significant. Have the disintegrations of other civilizations besides the Hellenic been accompanied by the Secession of an Internal Proletariat? If they have, has this Internal Proletariat been recruited, in these other cases too, from the same three sources: that is to say, from disinherited members of the Dominant Minority and from partially disinherited alien subject peoples and from doubly disinherited subject-alien deportees? Again, do we find such other internal proletariats responding to an identic challenge of oppression in the two alternative and contrary ways—the violent and the gentle¹—which we have learnt to distinguish in our study of the Hellenic example? And, if the gentle way has been followed by oppressed proletarians in other cases as well, has it led, here too, to the birth of 'higher religions' and to the establishment of universal churches?

In attempting to give a comprehensive answer to this set of questions, we shall find ourselves hampered by the fact that, *ex hypothesi*, the Secession of the Internal Proletariat takes place in the obscurity of an underworld, and that the history of its genesis and of its early growth is apt to be ignored and left unrecorded by the cultivated men-of-letters in the Dominant Minority, while the nascent Proletariat itself is ill equipped for keeping its own records at this momentous early stage of its career.² Thus we often find ourselves in the dark about a proletariat's history until this proletariat bursts out of the subterranean twilight in which it has been born into the broad daylight which plays upon the surface of social life; and the very fact that it has risen to the surface means that a proletariat is already near, or at, its prime by the time when it thus comes into view. This difficulty besets us even when we

city of Emesa (a duplicate of the more famous neighbouring Sun-worship of Heliopolis-Ba'lbak) which was momentarily given precedence over all other worship in the Roman Empire by the whim of Varius Avitus Bassianus—the hereditary High Priest and namesake of this Syrian divinity Elagabalus—during his short tenure of the Imperial throne under the impudently assumed name of Marcus Aurelius Antoninus (*imperabat* A.D. 218–22). For the contrast between the respective worship of the Sun as Elagabalus and as Sol Invictus, see Wissowa, G.: *Religion und Kultus der Römer*, 2nd edition (Munich 1912, Beck), pp. 365–8. The Emesan form of Sun-worship might perhaps claim to be a proletarian religion, but it certainly could not claim to be a 'higher' one. All the same, Aurelian, in the course of his campaign against Zenobia in A.D. 272, did visit the shrine of Elagabalus at Emesa, make offerings and dedicate temples to the god, and hold himself indebted to Elagabalus for the victory of Roman over Palmyrene arms (Homo, L.: *Essai sur le Règne de l'Empereur Aurélien (270–75)* (Paris 1904, Fontemoing), p. 101).

² For the transmuting effect of the waters of the stream of 'Folk-Memory' see V. C (ii) (a), Annex II, vol. vi, pp. 438–64, below.

are dealing with a disintegrating civilization which, like the Hellenic, has bequeathed to us a legacy of literature; and it still haunts us when we are able not merely to spell this literature out but also to recapture the living thoughts and feelings which the dead words were framed to express. The difficulty is accentuated when we have to depend upon mere fragments of literatures that have been recovered by the modern Western archaeologist's spade without there being any sensitive link of continuous tradition between our lives and those of these long-buried and quite forgotten writers. *Inter enim iectast vitae pausa*¹—and this breach of vital continuity will baffle us in grappling with the Egyptian and Sumeric and Hittite and Babylonian civilizations, notwithstanding the marvellous ingenuity of our scholars in deciphering their scripts. We shall find ourselves baffled still more cruelly by scripts which we have not yet succeeded in puzzling out, and which, for all we know, may be so rudimentary that, even if we could read the riddle, we should merely have gained a knowledge of statistics without having come any nearer to being initiated into the writers' ideas; and this is our predicament when we gaze at the Minoan 'linear script'² and at the Mayan pictograms and at the knotted cords of an Andean *quipu*. In trying conclusions with civilizations as elusive as these, we may be driven to confess that we are not only entirely unable to trace the genesis and growth of an internal proletariat, but that we cannot even guess at the existence or non-existence of such a thing by inference from the presence or absence of the Internal Proletariat's characteristic works, since in some of these cases we shall find that we cannot even say whether there is a trace, or no trace at all, of a 'higher religion' and a universal church.

Did a universal church, or anything like it, take shape during the disintegration of the Mayan or the disintegration of the Minoan Civilization? In the Mayan case we have had to be content with an inconclusively negative answer.³ In the Minoan case our eye has been caught by the tantalizing glimmer of a possibility that the vestiges of something which might be called a Minoan universal church may be preserved among the heterogeneous constituents of the historic Orphic Church which makes its appearance in Hellenic history from the sixth century B.C. onwards.⁴ We cannot, however, be positively certain that any of the practices and beliefs of Orphism, as we know these from Hellenic literature and inscriptions,

¹ Lucretius: *De Rerum Natura*, Book III, ll. 860-1.

² See V. C (i) (d) 6 (γ), p. 491, footnote 3, below.

³ See I. C (i) (b), vol. i, p. 127, above.

⁴ On this question see I. C (i) (b), vol. i, pp. 95-100, above. M. P. Nilsson (*Minoan-Mycenaean Religion and its Survival in Greek Religion* (London 1927, Milford), p. 512) inclines to the view 'that Crete actively contributed to the religious revival in the Archaic Age' of Hellenic history.

derive from any of the practices and beliefs of the Minoan religion, as we have to reconstruct these by inference from such Minoan material evidence—in the shape of ecclesiastical furniture and frescoes and vase-paintings depicting religious subjects—as the accidents of archaeological discovery have placed in our hands. So far from bearing indubitable testimony to the existence of a Minoan 'higher religion' and universal church, the appearance of Orphism on the Hellenic scene in the sixth century B.C. may, for all that we know, be more correctly interpreted as presumptive evidence that a Minoan 'higher religion' never came to birth. The existence of such a thing is not conclusively proved by the presence in Orphism of Cretan elements such as the myth of 'the Cretan Dionysus' (the child-god who is wickedly slain and whose slayers are the source of Man's original sin, while the sacrament of eating his body is the key to Man's salvation). On the other hand there are undoubtedly other elements in Orphism which are strongly reminiscent of contemporary Syriac religion and Indic philosophy.

Like Yahweh, and unlike Zeus, the Orphic God Phanes is a creator;¹ and the Orphic personified abstraction 'Ageless Time' (*Χρόνος Ἀγήραος*) has his double in the Zoroastrian 'Endless Time' (*Zrvān Akarana*)—the likeness extending to the grotesquely monstrous details of the visual form in which this strange divinity is presented.² There is an equally unmistakable Indic flavour about the Orphic doctrines that the Universe is an egg;³ that the body is a tomb (*σῶμα σῆμα*) in which a soul is imprisoned as a punishment for sin that has been committed in previous incarnations;⁴ that the punishment is recurrent in a cycle of rebirths from which the soul can never escape so long as there is any debit-balance against it in an account of sin and punishment which runs on through successive births and deaths; but that there does exist a way of escape which brings 'release from the circle and relief from evil'.⁵ The Orphic theology pictures the purified soul, which has obtained its release from the circle at last, as being permitted forthwith for the first time to drink a draught from the Lake of Memory,⁶ in reward for its virtue and in token that its labours are at an end; and this

¹ Guthrie, W. K. C.: *Orpheus and Greek Tradition* (London 1935, Methuen), p. 106.

² *Ibid.*, pp. 86-7, and Boulanger, A.: *Orphée* (Paris 1925, Rieder), p. 55. In Guthrie's opinion (*op. cit.*, pp. 76-8), which is followed here, the Orphic scriptures in which this grotesque figure is described give us a substantially authentic account of the original Orphism of the sixth century B.C. On the other hand Boulanger (*op. cit.*, pp. 53-9) contends that these scriptures reflect an Alexandrian Neo-Orphism of the second century B.C. and after, and that this differs *toto coelo* from the sixth-century original.

³ For the vogue of this idea in the Indic Mythology see Thomas, E. J.: *The History of Buddhist Thought* (London 1933, Kegan Paul), p. 87.

⁴ Guthrie, *op. cit.*, pp. 156-8.

⁵ *Ibid.*, pp. 165-71.

⁶ *Ibid.*, p. 177.

picture will remind us of Siddhārtha Gautama's legendary experience of recollecting all his previous incarnations at the moment when he attains the enlightenment of Buddhahood.¹

These Indic and Syriac features in Orphism are unmistakable, and the resemblances are too close to be dismissed as accidental. We have therefore to see in Orphism a 'syncretistic' religion; and we have also to take into consideration the probability that this intricate texture of Orphism is not the undesigned product of Time and Chance. It bears on its face the signs of being the deliberate artifice of a small band of creative individuals² who wove it, at one weaving, from a variety of materials that they picked out as apt for their purpose.³ The result of these theological labours was a 'book religion' in which right belief was accounted more important than correctly performed ritual;⁴ and, in the light of all this, we shall probably come to the conclusion that it is a rather far-fetched explanation to interpret Orphism as an effort to preserve or recapture a Minoan religious tradition which had survived the post-Minoan interregnum and had not been quite trampled out of all recognition by the barbarous Achaean usurpers of the derelict Minoan heritage.

It seems more natural to see in Orphism an effort to fill a fearful spiritual void which desolated the heart of an adolescent Hellenism just because no higher religious heritage had been transmitted to the Hellenes from their Minoan predecessors.⁵ We can well imagine that a sensitive Hellenic soul might become suddenly and painfully conscious of this void in the sixth century B.C.—partly because by that time the Hellenic Civilization had risen high enough above an Achaean barbarism to look down upon Olympus with mingled feelings of horror and contempt, and partly because at that very moment the political union, under the *Pax Achaemenia*, of all South-Western Asia, from the Hellenic coast of Ionia to the

¹ If the Orphic Lake of Memory is the source of Socrates' theory of *anamnesis*, then we can perhaps trace back one runnel of the stream of Hellenic philosophy to an Indic fountain-head.

² Guthrie, *op. cit.*, pp. 107, 120, 123. For the untoward effects of this apparently artificial origin upon the subsequent fortunes of Orphism see the present Study, V. C (i) (d) 6 (8), Annex, pp. 697-8, below. On the other hand, Boulanger (*op. cit.*, p. 45) submits that 'ce serait méconnaître complètement [la] nature [de l'orphisme] que de s'imaginer qu'il a pu sortir tout armé du cerveau d'un initiateur de génie. Il n'y a pas à l'origine de ce mouvement, comme à l'origine du pythagorisme, une puissante personnalité.' The uncertainty of our knowledge of Orphism is illustrated by the direct contradiction between this judgement of Boulanger's and that of Nilsson on the same point. In Nilsson's view (*op. cit.*, p. 511) 'Orphism is a speculative religion created by a religious genius, at least in its most vital doctrines'.

³ Guthrie, *op. cit.*, pp. 106, 110, 116, 194-5.

⁴ *Ibid.*, pp. 155, 204, 213.

⁵ For the intellectual precocity which, in the abortive Scandinavian as well as in the primitive Hellenic culture, was perhaps the consolation prize for the lack of a 'higher religion' in the new nascent civilization's social heritage, see II. D (vii), vol. ii, pp. 355-7, above.

Indic borderland in the Panjab, had suddenly opened the treasure-house of Syriac religion and Indic philosophy to any Hellene who cared to enter in and help himself to these spiritual riches.¹ This explanation of the origin of Orphism seems, on the whole, to be the more convincing of the two alternatives; and, on this showing, we shall have to confess that, after all, we have no knowledge at all of a Minoan universal church and therefore none, *a fortiori*, of a Minoan internal proletariat.²

We know next to nothing, again, about the internal proletariat of the Hittite Civilization, which perished, as we have seen, at an unusually tender age.³ We can only say that the wreckage of the Hittite Society which survived the great catastrophe at the beginning of the twelfth century B.C. seems gradually to have been assimilated by the Hellenic Society in part and in part by the Syriac, so that we must look to the histories of these two alien societies for any vestiges of the Hittite body social. We have already caught a doubtful glimpse of a Hittite dominant minority in the shapes of prince-prelates presiding over Anatolian temple-

¹ 'Il n'est pas invraisemblable que, par l'intermédiaire de l'Iran, l'Ionie ait pu connaître la doctrine hindoue de la migration des âmes et lui emprunter les formules que l'orphisme a rendues célèbres' (Boulanger, op. cit., p. 45). A hint of the active circulation and collision of ideas which was taking place within the Achaemenian Empire by the end of the sixth century B.C. is given to us in the Herodotean story—legendary though this may be in itself—of how Darius the Great (*imperabat* 522–486 B.C.) amused himself by confronting the Greeks at his Court with the Indians and provoking each of the two parties in turn to express their horror at the other party's customary method of disposing of their parents' corpses. For their mutual edification, what each party said about the other's custom was translated into the latter party's language by the Court interpreters (Herodotus, Book III, chap. 38). Compare the theological disputation at the Court of the Mongol Khāqān Mangū at Qaraqorum in A.D. 1254, as described in chapter 51 of the journal of a Flemish friar of the Franciscan Order, William of Rubruck (English translation in Komroff, M.: *Contemporaries of Marco Polo* (London 1928, Cape)). For the similar appetite of the Emperor Akbar for the comparative study of Religion see V. C (i) (d) 6 (δ), Annex, pp. 699–704, below.

² If Orphism is not the creation of a Minoan internal proletariat, it cannot strictly be described as a proletarian product, since the religious experience of the Syriac internal proletariat, upon which it appears to draw, has been drawn upon at second hand, while its Hellenic creators can hardly be counted as members of a Hellenic internal proletariat which, *ex hypothesi*, cannot have come into existence until after the breakdown of the Hellenic Society about a hundred years later (assuming that this breakdown is to be equated with the outbreak of the Peloponnesian War). The self-conscious, academic, bookish element in Orphism is certainly alien from the proletarian religious ethos as we know it in the classical examples. At the same time it is interesting to find the reviewer of Mr. Guthrie's book in *The Journal of Hellenic Studies* (vol. IV, part 2 (1935), p. 260) recommending 'the addition of one important point' to Mr. Guthrie's account of the Orphic religion:

'Orphism was a creation of the lower orders of Greek Society. Hence, among other things, its patronage by the House of Peisistratus, in accordance with the usual tyrants' policy of favouring the unprivileged classes. Probably, if all facts were known, we should find that Pythagoreanism was its aristocratic, and therefore more philosophic and reasoned, counterpart—much though that system, at least in its more popular forms, undoubtedly owed to beliefs and practices of a comparatively primitive type.'

If this is the truth, then Pythagoreanism stands to Orphism as the post-Socratic schools of Hellenic philosophy, from Platonism to Neoplatonism inclusive, stand to the worship of Cybele and Isis and to Mithraism, Christianity, and the Mahāyāna.

³ For the early death of the Hittite Civilization see I. C (i) (b), vol. I, pp. 93 and 114; IV. C (ii) (b) 2, vol. IV, pp. 108–12, above.

states¹ and oligarchies governing Etruscan city-states² during the last millennium B.C. The Etruscan aristocracy—whose Hittite origin seems probable, though unproven—undoubtedly gained admittance into the ranks of the Hellenic dominant minority; and we may perhaps espy the vestiges of a Hittite internal proletariat in the Cappadocian temple-serfs.³ Such vestiges, however, must remain unauthenticated unless and until our historical evidence increases; and, even if they did prove to be authentic, they would still remain mere curiosities of history. For every piece of Hittite flotsam and jetsam which may have risen to the surface of an alien civilization in a distant age,⁴ we may be certain that a thousand pieces were for ever submerged.

Changes of Masters.

In this respect the history of the Hittite wreckage, obscure though it is, throws a glimmer of light upon the common fate of all civilizations which have undergone in their disintegration the Hittite experience of being devoured by some alien civilization or civilizations before the disintegration-process has run its full normal course from breakdown to dissolution. Since we have come to suspect expansion of being a symptom of disintegration,⁵ we may assume, as a working hypothesis, that a society which is successfully expanding at a disintegrating neighbour's expense is itself likely to be already in disintegration, and is therefore probably divided already against itself into a dominant minority and a proletariat of its own. In such circumstances the alien elements which the aggressive society devours will be assimilated either to its internal proletariat or to its dominant minority; and the pro-

¹ For these temple communities, which were economic 'estates' and political 'states' at the same time, see IV. C (iii) (c) 2 (β), vol. iv, p. 422, footnote 3, and IV. C (iii) (c) 3 (α), vol. iv, p. 471, above.

² For the probable Hittite origin of the Etruscans see I. C (i) (b), vol. i, pp. 114-15, with Annex II, 2; II. D (iii), vol. ii, pp. 85-6; and IV. C (ii) (b) 2, vol. iv, p. 109, footnote 2, above.

³ 'À la fin de chaque guerre, le roi hittite ramène des pays conquis un butin d'hommes, de bétail et d'objets précieux. Les déportés ainsi transplantés en Hatti sont en majeure partie répartis dans les villes, dans les districts à repeupler, dans les propriétés des temples, avec un statut spécial et des droits limités; d'autres sont incorporés dans l'armée; d'autres, enfin, réduits en esclavage au profit des seigneurs et des guerriers' (Delaporte, L.: *Les Hittites* (Paris 1936, Renaissance du Livre), p. 184).

⁴ If we are right in regarding Etruria as a Hellenized transmarine asylum of a prematurely shattered Hittite Society, we may perhaps espy a second Etruria in the Taman Peninsula which faces the Crimea across the Straits of Kerch:

'The temples on the Taman Peninsula, as we learn from an inscription of Roman date, were organized like those in Asia Minor, especially those in Pontus, Cappadocia and Armenia: a college of priests or priestesses with a grand priest or priestess at its head; vast domains belonging to the goddess; and serfs working for the goddess and for the priests' (Rostovtzeff, M.: *Iranians and Greeks in South Russia* (Oxford 1922, Clarendon Press), p. 73. Cf. op. cit., pp. 161-2).

⁵ The evidence for this view that expansion and disintegration are correlated with one another is discussed in III. C (i) (α), vol. iii, and in IV. C (ii) (b), *passim*, vol. iv, above, and again in Part IX, below.

letariat is likely to be the receptacle for the majority of these alien recruits, since in conflicts of culture, as in physical warfare, the conquered are seldom admitted to share in the conqueror's privileges.

This *a priori* probability can be tested in the case of our own Western Civilization, which by now has swallowed—and in some degree digested and assimilated—at least eight alien societies: the Mexic, the Andean, the Hindu, the Iranic, the Russian Orthodox Christian, the Japanese Far Eastern, and the main bodies of the Far Eastern and Orthodox Christian societies in China and in the Near East. The number of victims rises from eight to ten if we reckon in the Yucatec and Arabic societies, which their Mexic and Iranic neighbours had respectively succeeded in devouring on their own account before these two gorged beasts of prey were preyed upon in their turn and disappeared down our Western Society's all-devouring throat.¹ Out of all these multitudes of alien souls that have thus been incorporated into the Western body social in the Modern Age, what elements have found their way into the dominant minority of our modern Western World? Apart from Cortez's Tlaxcalec allies in Mexico, whose treaty-rights to equality with the new masters of the Mexic World were respected by the Spanish Crown till its own rule in Mexico came to an end in A.D. 1821, we cannot call to mind more than two drafts of alien recruits which the Western dominant minority has admitted into its own ranks. These two are the governing class of a Muscovite Empire which sought and obtained admission to the comity of Western states at the close of the seventeenth century, and the governing class of a Japanese Empire which followed this Russian example in the third quarter of the nineteenth century. Both these contingents of *novi homines* have been weak in numbers; and the Russian contingent has already proved weak in social stamina as well, for in our generation it has been swept out of existence by a shattering revolution. When we look into the present social condition of a more recently Westernized Japan, we shall find ourselves wondering whether the Westernized masters of Japan, who are still in the saddle to-day, may not be destined to-morrow to follow in Russian footsteps for a second time by going through the Russian experience of A.D. 1917. If we do live to see a Westernized Japanese governing class share a Westernized Russian governing class's fate, then

¹ At our first encounter in this Study with the Iranic Civilization (in I. C (i) (b), vol. i, pp. 67-70) and with the Mexic Civilization (in I. C (i) (b), vol. i, pp. 119 and 123-4) we happened to come across both of them at a stage at which they had already devoured their respective sister civilizations; and accordingly, at first view, we had in either case the illusory vision of a single civilization—the 'Islamic' and the 'Central American'—in a field in which the presence of a pair of civilizations—the 'Iranic' and 'Arabic' and the 'Mexic' and 'Yucatec'—was revealed by further analysis.

we shall have seen the whole 'man-power' of ten disintegrating civilizations absorbed—with all previous social distinctions now confounded and effaced—into the gigantically swollen internal proletariat of the single civilization of the West.

The fate which has overtaken these ten victims of Western expansion in our own age, as well as the Hittite Society before them, suggests that it is not at all unusual for a disintegrating civilization to be devoured by a neighbour before its disintegration is complete. And this is, indeed, what we should expect *a priori*; for, while on the one hand the process of disintegration may be favourable to expansion, it is evident that on the other hand it may also expose a society to becoming the target and victim of attack instead of being the aggressor and the profiteer. A 'house divided against itself shall not stand';¹ and while it may be capable of burying the adjacent buildings under its own ruins if it is left alone to collapse, it will be quickly demolished by the house-breaker if he comes upon the scene and decides to anticipate the leisurely work of Time. A dominant minority is particularly vulnerable to assault from an alien power because it is itself already an alien power in the eyes of its subjects. A moral alienation from the Dominant Minority is the essence of what we mean by the 'Secession' of the Proletariat. What motive has the Proletariat for sacrificing itself, at its momentary master's call, in order to save his mastery for him and thereby condemn itself to remaining in servitude to this particular master instead of allowing his place to be taken by another who may perhaps turn out to have a lighter hand? And even if the Proletariat does prefer its present master—out of fear of the unknown or out of inertia or even out of positive regard for him—is it likely that its servitude will have left it with the spirit and initiative to assert its will, even within this narrowly restricted field of a choice between two alternative yokes?

A test case is the behaviour of the internal proletariat in the Andean universal state when the Spanish *conquistadores* suddenly broke in and challenged the Incas to stand and deliver. The *orejones* were perhaps the most amiable and able dominant minority that any disintegrating society has ever produced; and it seems almost an abuse of words to employ the term 'Proletariat' at all in reference to the conscientiously tended flock of these genuine 'shepherds of the people'.² The docile beneficiaries of a paternal

¹ Matt. xii. 25.

² Both the moral and the technical eminence of the Incas as a dominant minority are revealed in the care which they took to avoid the social evil of 'deracination' (which is one of the most effective efficient causes of an internal proletariat, to judge by the Hellenic example). The Incas were at pains to spare the established local institutions in the conquered territories—although they had absolute power, *de facto* as well as *de jure*, to alter them (Baudin, L.: *L'Empire Socialiste des Inka* (Paris 1928, Institut

Pax Incaica felt an unqualified veneration for the Incas, and would perhaps even have loved them if they had ever ventured to adopt such a sacrilegiously familiar attitude. Even in the more recently conquered subject communities there seems to have been little discontent and no eagerness for an opportunity to shake off the Grand Inca's rule. The routine of obedience had been so thoroughly inculcated into the people that 'the machine went on working by itself after the mechanic was dead, and we have Ondegardo's testimony for the fact that, after the Spanish conquest, the Indians persisted in the cultivation of the Inca's lands and in the delivery of the crops to the Imperial granaries'.¹ Yet the Inca's submissive subjects were far indeed from being 'a very present help in trouble'² when the Inca, with Pizarro's fangs in his throat, was in desperate need of their loyal and valiant service. We have, no doubt, to allow for the fact that at the moment when the Spaniards appeared on their horizon the mental attitude of the Inca's

d'Ethnologie), p. 62); and it was their policy to leave the hereditary local chiefs (*kuraka*) in office as members of the Incaic official hierarchy (Baudin, op. cit., pp. 119-20); but their anxiety to avoid the evil of 'deracination' is most evident in their methods of redistributing the population of their dominions. While such redistribution was carried out in the Incaic Empire on the grand scale, the cases in which the exchange of populations was made for the political purpose of severing a recalcitrant people's links with its home and its past seem to have been exceptional. Apart from those members of the dominant minority who were planted in the conquered territories as garrisons or supervisors, the great majority of the deportees (*mitimaes*) seem to have been transplanted for economic reasons: either in order to adjust the relative local density or sparseness of population to the relative local scarcity or abundance of the means of subsistence, or else in order to bring some particular kind of human skill—agricultural or industrial—to places where there was a shortage of it and where a larger supply could be employed with economic advantage. These 'economic', as contrasted with the 'political', deportees 'were granted privileges designed to facilitate their resettlement and in particular they were given long terms of exemption from all taxation. They remained under the authority of their own chiefs, and were exempt from the rule of the chiefs of the territory where they were planted. Moreover their fellow-Indians from their home-country used to come and help them at harvest-time and sowing-time.' In some cases the deportees were charged with the duty of keeping their home-country supplied with food and raw materials (e.g. lama-wool); and it became one of the administrative practices of the Imperial Government to couple districts together in pairs—e.g. a cold highland district and a warm lowland district, which might perhaps be a long distance apart—in order that they might make up one another's deficiencies by an exchange of produce. When transfers of population were made between the two districts in a pair of this kind, the deportees had, of necessity, to be exposed to a climate which was different from that to which they were accustomed. On the other hand, when a loyal population was exchanged for a disaffected population as a political measure, care was taken that the loyalists should only be sent to districts where the climate was the same as that of their homes (Baudin, op. cit., pp. 131-6; compare Joyce, T. A.: *South American Archaeology* (London 1912, Lee Warner), p. 105; Markham, Sir Clements: *The Incas of Peru* (London 1910, Smith Elder), pp. 164-5; Cunow, H.: *Geschichte und Kultur des Inkareiches* (Amsterdam 1937, Elsevier), pp. 58-60).

It will be seen that this scientifically and humanely managed 'internal colonization' in the Incaic Empire was something totally different, both in spirit and in effect, from the Assyrian deportations or from the Roman or modern Western slave-trade. The only people in the Incaic Empire who were both uprooted and enslaved were the *yanakuna*, and these domestic slaves of the Imperial Household, who originated in a band of traitors that had been reprieved from a sentence of death, eventually acquired the powers and privileges of the Ottoman Pādīshāh's *qullar* (Baudin, op. cit., pp. 75-7; Cunow, op. cit., pp. 94-5).

² Psalm xlv. 1.

subjects was confused, and their allegiance divided, by the unprecedented, and therefore profoundly shocking, public calamity of the civil war between Huascar and Atahualpa.¹ This was not, however, the governing factor in the situation. The fundamental cause of the Inca's undoing is to be found in that very belief in his divinity and invincibility which had built his Empire up, and kept it in being, so long as no alien assailant had appeared above the horizon. When these human sheep saw their demigod helplessly defeated, deposed, insulted, and injured, it never occurred to them that they might help him effectively themselves. They were only conscious that their universe had been turned upside-down; and the shock was prostrating and paralysing.² Atahualpa's partisans looked on in horror-stricken passivity while their master was put to death, and the usurper's opponents delivered themselves tamely into his brutal murderers' hands.³

¹ 'On fait grand état du peu de résistance offerte par les Péruviens aux Espagnols, mais... à cette époque les Indiens étaient en pleine guerre civile; ceux du Pérou, dont le souverain légitime Huascar avait été détrôné par le bâtard Atahualpa, regardaient les blancs comme des sauveurs, leur savaient gré d'avoir fait prisonnier cet usurpateur, et leur faisaient fête. Ce sont des Indiens de Cuzco qui ont marché sous les ordres des Espagnols contre les Indiens de Quito. En somme, l'arrivée des blancs n'a été qu'un épisode dans la grande lutte entre les Inka et les Kara... Si les Espagnols étaient arrivés quelques années plus tôt, au moment où régnait Huayna-Kapak, ils n'auraient pas aussi facilement conquis le Pérou... Ajoutons que, sans l'aide des Indiens de Cuzco, jamais les Espagnols n'auraient pu, avec les faibles effectifs dont ils disposaient, soumettre le royaume de Quito.'—Baudin, L.: *L'Empire Socialiste des Inka* (Paris 1928, Institut d'Ethnologie), p. 209.

It will be seen that Pizarro, like Cortez, was one of Fortune's spoil children. Indeed, his arrival in the Andean World at the moment of the civil war between Huascar and Atahualpa was a far more extraordinary stroke of luck than Cortez's arrival in the Mexic World at the moment of the war between the two city-states of Tenochtitlan and Tlaxcala; for in the Mexic World in its 'Time of Troubles' international warfare was perennial, whereas in the Andean World in its universal state civil warfare was an unheard-of lapse from an established *Pax Incaica*.

² 'Enfin et surtout, en raison même de la centralisation excessive du pouvoir au Pérou, la perte du chef aboutissait à l'anéantissement de l'armée. L'extraordinaire discipline qui régnait dans l'Empire, chez les civils comme chez les militaires, avait à tel point détruit l'esprit d'initiative individuelle que les hommes, n'osaient ou même ne savaient plus agir quand ils n'étaient pas commandés. La preuve en est que les Indiens de l'ancien royaume de Quito, soumis pendant moins de temps que les Péruviens à la puissance de l'Inka, résistèrent vaillamment aux Espagnols... Les Indiens n'étaient point des lâches, mais ils avaient été pendant si longtemps condamnés à une obéissance passive qu'ils n'étaient braves que lorsqu'ils recevaient l'ordre de l'être.'—Baudin, L., op. cit., pp. 209-10.

³ The moral paralysis of the Inca's subjects in face of the Spanish aggressors must not, of course, be exaggerated. The recently subjected population of the *ci-devant* Kingdom of Quito did put up a stout resistance, as is pointed out in the passage quoted from a French authority in the preceding footnote. 'Quant à la débâcle de l'armée d'Atahualpa, dès que celui-ci fut pris par les Espagnols, elle s'explique fort bien. Il y eut d'abord une véritable trahison, car le souverain péruvien recevait les étrangers en amis, sans avoir tenté de les arrêter dans les défilés de la Cordillère, ce qui lui eût été extrêmement facile... Les Péruviens eux-mêmes, quand ils se rendirent compte que les Espagnols détruisaient leurs institutions et dilapidaient leurs biens, trouvèrent parmi eux des chefs énergiques et peu s'en fallut que les blancs ne fussent chassés du plateau.'—Baudin, op. cit., pp. 209-10.

The heroic resistance which was kept up by the Inca 'Die-Hards' in the fastnesses of the Vilcapampa Mountains for some thirty years after the entry of the Spanish *conquistadores* into Cuzco is touched upon, in another context, in V. C (ii) (a), vol. vi, p. 213, below.

The last state into which the Andean internal proletariat has sunk since its exchange of indigenous for alien masters has been described at first hand by a practised nineteenth-century English observer:

'The sudden fall of a whole race is an event so rare in history that one seeks for explanations. It may be that not only the royal Inca family, but nearly the whole ruling class, was destroyed in war, leaving only the peasants who had already been serfs under their native sovereigns. But one is disposed to believe that the tremendous catastrophes which befel them, in the destruction at once of their dynasty, their empire, and their religion by fierce conquerors, incomparably superior in energy and knowledge, completely broke not only the spirit of the nation but the self-respect of the individuals who composed it. They were already a docile and submissive people, and now under a new tyranny, far harsher than that of rulers of their own blood, they sank into hopeless apathy and ceased even to remember what their forefathers had been. The intensity of their devotion to their sovereign and their deity made them helpless when both were overthrown, leaving them nothing to turn to, nothing to strive for. . . . The Peruvian subjects of the Incas had reached a state of advancement which, though much below that of the ancient Egyptians and Babylonians, was remarkable when one considers that their isolation deprived them of the enormous benefit of contact with other progressive peoples. . . . The impact of Spanish invasion not only shattered their own rudimentary civilization to pieces, but so took all the heart and spirit out of them that they have made practically no advances during four centuries, and have profited hardly at all by the Western Civilization of their masters.'¹

If this is how the subjects of so good a master as the Inca behaved when this master was being violently and unjustly robbed of his kingdom, we shall not be surprised to see other proletariats accepting or welcoming the overthrow of dominant minorities that have been oppressive in policy or alien in origin or odious on both these accounts at once. We have observed in other contexts² how readily the exploited peasantry of East Central Anatolia, who had been saddled with the burden of the East Roman Government's imperialism, 'turned Turk' upon the advent of the Saljūq Muslim invaders in the eleventh century of the Christian Era. *A fortiori* in India, from the morrow of the death of Awrangzīb to the eve of the Indian Mutiny, the Hindu *ra'iyeh* looked on as harassed yet nevertheless passive and indifferent spectators while the alien Muḡhal Rāj was crumbling away and the likewise alien British Rāj was being erected on its derelict site. We discern the same indifference

¹ Bryce, James: *South America: Observations and Impressions* (London 1912, Macmillan), pp. 114-15 and 481-2.

in the passivity with which the Egyptians accepted the substitution of an alien Macedonian for an alien Achaemenian régime in 332 B.C., ten years after the Achaemenian reconquest¹ had put an end to an interlude of national independence in Egypt and had thereby banished from the field of practical politics the only political prospect that could awaken any enthusiasm in Egyptian hearts.²

The Babylonians' attitude towards the contest for imperial dominion between their alien Achaemenian masters and the alien Macedonian competitors of the Achaemenidae was more positive than the Egyptians' attitude and was to that extent still more conducive to a change of alien régime. The Babylonians did not merely accept Alexander with a cynical resignation as just another Darius in Hellenic costume: they welcomed him with open arms as a liberator—in the spirit in which, some two hundred years earlier, Darius's predecessor Cyrus had likewise been welcomed in Babylonia by Jewish deportees³ to whom the yoke of the Neo-Babylonian Empire of Nebuchadnezzar and Belshazzar had been as grievous as the yoke of the Achaemenian Empire was afterwards felt to be by the dethroned descendants of the Jews' Babylonian oppressors when these oppressors were condemned, by the turn of Fortune's wheel, to receive for themselves the measure which they had formerly meted out to others.⁴ For the Jewish victims of a Babylonian dominant minority in the sixth century B.C. and for the Babylonian victims of a Persian dominant minority in the fourth century B.C. the change of alien masters almost wore the appearance of a 'dayspring from on high' which had come 'to give light to them that sit in darkness and in the shadow of death'.⁵

These examples make it evident that, whatever the spirit may be in which a subject population greets a change of masters—whether it naïvely proclaims the dawn of a new era or mutters 'plus ça change plus c'est la même chose'⁶ with a sceptical shrug of the shoulders—the eviction and replacement of one dominant minority by another can very easily take place in any society that has once come to be divided against itself by that schism between Dominant Minority and Proletariat which is a symptom and a

¹ For the reconquest of Egypt in 343–2 B.C. by Artaxerxes Ochus see V. C (i) (c) 3, p. 245, footnote 4; V. C (ii) (a), vol. vi, p. 207; V. C (ii) (b), vol. vi, p. 302; and V. C (ii) (a), Annex II, vol. vi, p. 442, below.

² In the mental realm of 'folk-lore' the Egyptians seem to have reconciled themselves to living under the Macedonian régime by transmuting Alexander the Great into an Egyptian national hero (see V. C (ii) (a), Annex II, vol. vi, pp. 441–4, below).

³ For the Jewish attitude towards Cyrus see 2 Chron. xxxvi. 22–3; Ezra i. 1–4; Isa. xlv. 28, and xlv. 1–4.

⁴ For the Babylonians' attitude towards the Achaemenian régime see further the present chapter, p. 123, with footnote 2; V. C (i) (c) 4, pp. 347–8; and V. C (ii) (a), Annex II, vol. vi, p. 442, below.

⁵ Luke i. 78–9.

⁶ Karr, Alphonse: *Les Guêpes*, January 1849.

penalty of social disintegration. We have dwelt on this point because it is another obstacle with which we have to cope in our survey of internal proletariats. For if a disintegrating civilization is apt to have its term of independence curtailed through being eaten up by some neighbour, we are evidently likely to be baffled, in attempting to follow out the history of this or that internal proletariat, by finding our specimen suddenly incorporated into an alien body social before it has had time to bring forth its own particular fruits. This heavy mortality among disintegrating civilizations may perhaps provide the social anatomist with richer materials for study when he essays to dissect some great voracious shark—a monster such as our own Western Society has come to be in its latter days—which has swept together into its insatiable belly the half-digested remains of a shoal of smaller fry; but, by the same token, the dissection of the shark-society's victims is manifestly bound to be an inordinately difficult business if we can only recover their mortal remains in this half-masticated condition. In such adverse circumstances we must be content if we can identify an organ or trace the development of a function here and there when we are dealing with disintegrating societies whose careers have been thus cut short.

The Japanese Internal Proletariat.

Some clear tokens of the secession of an internal proletariat can be discerned in the history of the disintegration of the Far Eastern Society in Japan, which had run through its 'Time of Troubles' and entered into its universal state before the Western Society swallowed it up.

If we are looking, for instance, for counterparts of those citizens of the Hellenic city-states who were uprooted by the series of wars and revolutions which began in 431 B.C., and who found a disastrous outlet and livelihood as mercenary soldiers, we shall observe an exact parallel in the *ronin*, or masterless unemployed men-at-arms, who were thrown off, during the Japanese 'Time of Troubles', by a feudal anarchy. The parallel extends to details; for Hideyoshi's abortive attempt to conquer Korea and China, like Alexander's successful conquest of South-Western Asia and Egypt, may be interpreted as an expedient for turning these formidable vagrants' arms against an alien body social. Again, the *Eta* or pariahs who survive as outcasts in the Japanese Society of the present day may be accounted for as a still unassimilated remnant of the Ainu barbarians of the Main Island of the Japanese archipelago, who, during the 'Time of Troubles', were forcibly incorporated into the Japanese internal proletariat by the arms of the

wardens of the North-Eastern marches,¹ as the barbarians of North-Western Europe and North-Western Africa were incorporated by Roman arms into the Hellenic internal proletariat during the corresponding phase of the disintegration of the Hellenic Society. In the third place we can discern Japanese equivalents of those 'higher religions'—Christianity and Mithraism and the worships of Isis and Cybele—in which the Hellenic internal proletariat sought and found its final and most effective response to the challenge of the tribulations which it had to endure at the hands of a dominant minority.

In the history of the disintegration of the Far Eastern Society in Japan the corresponding religions² were Jōdo ('Pure Land'), which was founded in A.D. 1175 by Hōnen Shonin (*vivebat* A.D. 1133–1212); the Jōdo Shinshū ('True Sect of Jōdo'), which was founded by Hōnen's disciple Shinran (*vivebat* A.D. 1173–1262); the Hokke ('Lotus Sect'), which was founded by Nichiren (*vivebat* A.D. 1222–82); and the Zen, which was an adaptation of the Chinese Ch'an³ and was introduced from China into Japan by Eisai (*vivebat* A.D. 1141–1215) and Dōgen (*vivebat* A.D. 1200–53). It will be seen that, if we have been right in dating the breakdown of the Far Eastern Civilization in Japan *circa* A.D. 1156–85,⁴ the founders of these four religions all belong either to the generation which came of age at the moment when the Japanese 'Time of Troubles' set in, or else to one or other of the two generations immediately following; and we have positive evidence that *post hoc* does signify *propter hoc* in this case. On the one side the founders themselves were conscious of having been born into a 'Time of Troubles'. Already in the Heian Age, which was the autumn of the exotic Far Eastern culture's brief *floruit* on Japanese soil, the Amidist Mahayanian theologian Genshin (*vivebat* A.D. 942–1017) had declared that 'the fateful days' had 'arrived';⁵ and Nichiren believed himself to be living in the Age of Mappō ('the Destruction of the Law').⁶ On

¹ The Japanese 'Time of Troubles' was inaugurated and precipitated by this conquest and incorporation of the barbarians in the no-man's-land beyond the north-eastern marches (see II. D (v), vol. ii, pp. 158–9; III. C (i) (a), vol. iii, pp. 144–5; and IV. C (ii) (b) 2, vol. iv, p. 94, above; and V. C (i) (c) 3, in the present volume, p. 208, below).

² See Murdoch, J.: *History of Japan*, vol. i (London 1910, Kegan Paul), pp. 439 and 477–8.

³ This Chinese name Ch'an is derived from a Sanskrit word Dhyāna, meaning 'meditation'; but there appears to be no evidence that the special theory and discipline that were held and practised in China under this name were not an original product of the Far Eastern genius. (On this point see Sansom, G. B.: *Japan, A Short Cultural History* (London 1932, Cresset Press), p. 329, and Eliot, Sir Ch.: *Japanese Buddhism* (London 1935, Arnold), p. 285.)

⁴ See IV. C (ii) (b) 2, vol. iv, p. 94, above.

⁵ Anesaki, M.: *History of Japanese Religion* (London 1930, Kegan Paul), p. 170.

⁶ Nichiren articulated the history of Buddhism into three millennia running from the Buddha's death (which, in the Far East, was reckoned to have occurred in 947 B.C.): first the Age of Shōbō ('the True Law' of the Hinayāna); second the Age of Zōbō

the other side the ground-down peasants and the Spartanly disciplined soldiers to whom the founders of the new religions were addressing themselves were hungry for spiritual food. 'Many minds are turning to religion' is the opening phrase of a tract¹ which Nichiren published in A.D. 1260; and this diagnosis was borne out by the multitude of the converts which each of these new religions won within its founder's lifetime.

These religions of the Japanese internal proletariat resemble those of the Hellenic internal proletariat in being of alien inspiration. All four are variations on the theme of the Mahāyāna; three of the four (i.e. all but Nichiren's creed) had been conceived in the main body of the Far Eastern World, on the continent, before they were adopted and adapted by Japanese apostles for Japanese use; and the two apostles who transplanted the Zen both started operations by making a pilgrimage to China to study their subject in its native setting, in accordance with a precedent which had been set by earlier Japanese divines who had sought to acclimatize other schools of the Mahāyāna in Japan at the time of the original reception of the Far Eastern Civilization. When we compare them, however, with these predecessors of theirs in 'the Nara and Kyoto Period' of Japanese history, we shall find that the characteristic note of the great religious geniuses of 'the Kamakura Period'² is not their receptiveness but rather their vein of originality. In the forms in which it had been introduced into Japan in that earlier age, the Mahāyāna, like the Far Eastern Civilization itself, had been a hot-house plant which had never struck root in Japanese soil or acclimatized itself to the Japanese air. While it had nominally been accepted by all the Emperor's subjects *en masse*, it had never been seriously practised, and indeed never properly comprehended, outside a narrow circle round the Imperial Court; and the people at large had gone on walking in the ways of the primitive paganism of the Japanese 'Times of Ignorance'.³ This paganism, however, no longer sufficed to satisfy the common people's spiritual needs when the glass-house which had hitherto sheltered the exotic culture collapsed in ruins, and when this cultural catastrophe spread social devastation far and wide. In its disastrous downfall the Far Eastern Civilization in Japan at last made an impact upon the masses whose life it had scarcely succeeded in affecting during its

('the Image Law' of the Mahāyāna); third (beginning *circa* A.D. 1053) the Age of Mappō ('the Destruction of the Law'). See Eliot, Sir Ch.: *Japanese Buddhism* (London 1935, Arnold), pp. 277-8 and 424-5.

¹ Quoted in Eliot, *op. cit.*, p. 276.

² For this periodization of Japanese history see II. D (v), vol. ii, pp. 158-9, above.

³ At this stage the Japanese paganism was accommodated to the Mahāyāna by the formal identification of this or that Japanese *numen* with this or that Bodhisattva (see V. C (i) (d) 6 (δ), p. 528, footnote 2, below).

brief age of artificial and precarious prosperity. The onset of a 'Time of Troubles' turned these masses into a proletariat in sore need of spiritual salvation; and the founders of the four new Japanese religions rose to the height of this critical occasion by offering their people the spiritual bread of the Mahāyāna in forms plain enough for them to manage to digest it.

This provision of a simplified Mahāyāna as a substitute for a primitive paganism was the essence of these Japanese apostles' work; and in consequence that work presents itself in diverse aspects, which differ almost to the point of being mutually contradictory, according to the standards by which we appraise it. If we compare these apostles' teachings—and this is the more apposite comparison—with the primitive paganism which, in fact though not in theory, had continued to be the religion of the common people in Japan until these simple forms of Buddhism were brought within their reach—then we shall see Jōdo and Jōdo Shinshū and Hokke and Zen as so many new 'higher religions'. On the other hand, if we compare them with the sophisticated forms of the Mahāyāna that had been cultivated in Japan by a small *élite* since the sixth century of the Christian Era, and *a fortiori* with the Chinese originals of these Japanese copies, then we shall see in the new Japanese religious mass-movements of 'the Kamakura Age' not a notable advance from paganism but a lamentable relapse, in the religious field, into the barbarism which was at this time unquestionably regaining the upper hand over the exotic Far Eastern culture in other departments of Japanese life. This second view is not untrue, but it is neither the whole truth nor, perhaps, the most significant part of it.

If the work of the Japanese apostles of 'the Kamakura Age' was in one sense an *œuvre de vulgarisation*, this was at least the deliberate act of noblemen and scholars who were not, themselves, either vulgar or ignorant. Hōnen was the son of a provincial official of the Imperial Government; Shinran and Dōgen were the sons of blue-blooded dignitaries of the Imperial Court; and even Nichiren's father, who was a fisherman in a then outlandish eastern province, was said to have been a man of good family who had been banished to this obscure corner in punishment for some political offence. Again, Hōnen, Shinran, Nichiren, and Eisai all spent years of study in the famous monastery of the 'high-brow' Tendai sect on Mount Hiei, overhanging the old Imperial capital of Kyoto, before they ventured to formulate and proclaim new personal messages of their own. What moved them all to break away from an esoteric tradition, and to address themselves to the people at large in terms which simple minds could understand, was a

realization, through their own experience and intuition, that the exotic Chinese forms of Buddhism which were cultivated on Hieizan could no more avail to satisfy a down-trodden Japanese peasant's soul than the exotic Chinese system of government which was practised at Kyoto could avail to keep the Japanese countryside in order. The anarchy let loose by the breakdown of an artificial régime which had never been suitable to Japanese social conditions had been brought home to Hōnen as an eight-years-old child by a poignant personal experience¹ which became the starting-point of his spiritual career. The boy's father, when dying of a mortal wound received in an attack on their home by a band of brigands, had adjured his son to forgo the vendetta which was laid upon him by the conventional code of his class, and to become a monk instead. After duly mastering the traditional lore and practice of the Tendai school of the Mahāyāna, Hōnen eventually 'demonstrated his zeal by abandoning all his former attainments and devoting himself exclusively to faith in the grace of the Buddha'.² Hōnen and his fellow apostles had a deep feeling for the sufferings of their generation, and they strove to find a way of salvation that would be open to all Mankind.

This eagerness to reach and help all sorts and conditions of people is the key to almost every aspect of these Japanese prophets' preaching and practice. Hōnen, Shinran, and Nichiren all threw open the gates of salvation to women by teaching that they too, as well as the other sex, were capable of ultimately attaining Buddhahood.³ In the Zen school the principal difference between Eisai and his successor, Dōgen, is to be found not in their doctrine or in their practice but in the public to which they respectively addressed themselves. While Eisai's 'influence was limited to monks and nobles, . . . Dōgen made every effort to avoid contact with men of high rank'.⁴ The Zen, which in China had been cultivated by recluses, became in Japan (like Mithraism in the Roman Empire) the religion of the soldiers. And in the Japan of 'the Kamakura Age' the soldiers, peasants, and women, between them, vastly outnumbered the courtiers, monks, and scholars.

In addressing themselves to this immense and unsophisticated public, the new teachers adopted the appropriate technique and tactics. For instance, they wrote (those of them who did write) not in Classical Chinese, but in the Japanese vernacular, and they conveyed this in a comparatively simple script.⁵ (The Zen School were not troubled by any literary problem, since they eschewed

all scriptures and put their whole trust in austerity and intuition.) Again, while both Hōnen and Shinran sat in Kyoto and waited for disciples to find their way to them—until the Government forced both these sedentary apostles into the mission-field by banishing them to distant provinces¹—Nichiren started his ministry by making a round of missionary journeys, and when he reverted to stability he planted himself, with a man of action's eye, not in the old Imperial capital at Kyoto, from which the power had now departed, but in the neighbourhood of Kamakura, which was the head-quarters of the new military régime of the Minamoto Shogunate and the Hōjō Regency. From this point of vantage Nichiren propagated his doctrine by popular preaching in public places. Eisai and Dōgen each in turn settled in Kyoto after coming home from China and each in turn left Kyoto after having given it a trial. Eisai finally gravitated, like Nichiren, to Kamakura, while Dōgen founded a monastery in the province of Echizen.

It was not enough, however, for these preachers of salvation for all Mankind to put themselves into contact with their public in print or in person. If they were to make certain of being 'understood of the people', their doctrine itself must be brought within the people's mental range; and, while the Zen school differed from the rest in making the pursuit of salvation strenuous, they all agreed in depreciating the value of sheer intellect.

The theory of the Zen was that the enlightenment which was its aim could not be attained either through reading scripture or through listening to a teacher, but only through introspection; and this introspection could not arrive at its goal—which was the attainment of enlightenment in a sudden flash of intuition—except through an ascetic spiritual self-discipline. In this indispensable preparatory training the aspirant after the enlightenment of the Zen was thrown almost entirely upon his own spiritual resources; and it was only by hints and nudges that his spiritual director could help him to grope his way through the darkness towards the light.² This way of salvation attracted 'simple soldiers' because it was at once morally difficult and intellectually easy.³ The schools which appealed to a civilian public—to 'the man in the street' and to the woman in the paddy field—were concerned

¹ Hōnen and Shinran both eventually returned to Kyoto in order to die there, but Shinran had spent more than twenty years in the provinces in the interval, though his sentence of banishment had been revoked after he had passed four years in compulsory exile.

² The attitude of the master towards the pupil in the Zen school of Buddhism would appear to resemble very closely that which Plato has described as being his in a passage (Plato's Letters, No. 7, 341 B-E) quoted in III. C (ii) (a), vol. iii, p. 245, above.

³ The Zen was, in fact, a way of transferring the soldier's activity from the Macrocosm to the Microcosm without changing its ethos (see Murdoch, *op. cit.*, vol. i, pp. 484-5). In the Kwanto the Zen Buddhist clergy followed the path of secularization to the length of abandoning celibacy (Murdoch, *op. cit.*, vol. i, pp. 482-3).

to make salvation easy in the intellectual and in the moral sense alike; and these schools all found their clue in salvation by faith.

For the Jōdo and the Jōdo Shinshū the subject of this faith was the Bodhisattva Amida (i.e. Amitabha)¹; for the Hokke—which in this respect stood at the opposite pole from the Zen—the object was not a person but a scripture: the Lotus Sutra from which this school derived its name. Already, before the breakdown, Genshin had proclaimed that

'We, the weak and vicious people of the "Latter Days", could not be saved but by invoking the name of the Lord Amida.'²

And this message of salvation by faith in Amida was taken by Hōnen as his principal theme.

'There may be millions of people who would practice [Buddhist] discipline and train themselves in the way of perfection, and yet in these latter days of the Law there will be none who will attain the ideal perfection. Consider that it is now an age full of depravities. The only way available is the Gateway to the Land of Purity.³ . . . There shall be no distinction, no regard to male or female, good or bad, exalted or lowly; none shall fail to be in His Land of Purity after having called, with complete desire, on Amida.'⁴

This concern to make salvation easy almost at all costs—in reaction against the esoteric note of Japanese Buddhism in a preceding age which had ended so disastrously—produced not altogether happy results. Nichiren, who attacked the Jōdo vehemently, nevertheless agreed with Hōnen in virtually reducing the believer's whole duty to the repetition of a spell which was supposed to enshrine the quintessence of the object of faith by invoking that object's name. Hōnen's formula was *Namu Amida Butsu* (abbreviated to *Nembutsu*), meaning 'Adoration to the Buddha of Infinite Life and Light';⁵ Nichiren's was *Namu Myōhō-Renge-Kyō*, meaning 'Adoration to the Lotus of Perfect Truth'; and it was for him 'not a mere oral utterance but a real embodiment of the truths revealed in that book.'⁶ . . . To utter the "Sacred Title" was, according to Nichiren, the method of at once elevating oneself to the highest enlightenment of Buddhahood.⁷ This expedient

¹ Eliot, op. cit., pp. 392-3, draws a parallel between the attitude of the Shinshū towards Amida and that of the Hindu Shaivas and Vaishnavas towards Shiva and Vishnu. The Shinshū can, of course, be traced back to the same Indic-proletarian origins as the worship of the two Hindu deities. For the Jōdo conception of Amida's Paradise see V. C (i) (d) 11, vol. vi, p. 164, footnote 3, below.

² Quoted by Anesaki in op. cit., p. 170.

³ Quoted, from Hōnen's tract *Senchaku-shū*, by Anesaki in op. cit., p. 171.

⁴ Quoted, from Hōnen's *Catechism in Twelve Articles*, by Anesaki in op. cit., p. 174.

⁵ Anesaki, op. cit., p. 173.

⁶ The Lotus Sutra lends itself to this treatment, since its twenty-first chapter is devoted to spells (see V. C (i) (d) 6 (δ), p. 556, footnote 2, below).—A.J.T.

⁷ Anesaki, op. cit., pp. 192-3.

promised to bring salvation within all men's reach at the price of transmuting a sublime philosophy into a rudimentary kind of magic.¹ And this intellectual retrogression had its moral counterpart in a relaxation of the rules of conduct. Shinran, who deprecated Hōnen's insistence upon the value of 'vain repetitions', was led to differ on this point from his master not because he was intellectually sceptical about the efficacy of 'spell-binding', but because he suspected such magical 'works' of being symptoms of a lack of faith in the all-sufficing grace of Amida. On the same ground Shinran deprecated 'any scruple about sins or depravities'; and—regarding celibacy, in this light, as 'a sign of lack of absolute trust in Buddha's grace'—he practised what he preached by discarding his monkish habit and tonsure, marrying a wife, and begetting children, 'in order to "give a living testimony" . . . that the secular life of common people was no obstacle to salvation'.²

While the Jōdo, Jōdo Shinshū, and Hokke schools were thus all at one in seeking, at almost any price, to make salvation morally as well as intellectually easy, they were by no means uniform in their ethos; and in this aspect they display our now familiar contrast between the gentle and the violent reaction of an internal proletariat, the gentleness of the Japanese soul being incarnate in Hōnen, and its violence in Nichiren. Hōnen 'was a man of meek temper and responsive heart, and in this respect he represented the heritage from the culture of the preceding age, while he was a typical pioneer of the new age in his aspiration for the salvation of all'.³ On the other hand, 'Nichiren's religion represented in many respects the robust spirit of Eastern Japan which had always been in revolt against the ritualism and sentimentalism of the aristocratic Buddhists of Miyako [Kyoto]', and 'his appeal found an easy acceptance among the virile warrior classes⁴ and the earnest peasants of the eastern provinces'.⁵ Nichiren denounced Hōnen in unmeasured terms⁶ as a heretic and a decadent. In a 'Treatise on the Establishment of Righteousness and the Peace of the Country' (*Risshō Ankoku Ron*) which he presented to the Hōjō Regent at Kamakura in A.D. 1260⁷ he laid it down that killing

¹ For an analogous transmutation of Hellenic philosophy in the third to fifth centuries of the Christian Era, and of Sinic philosophy in the age of the Han, see V. C. (i) (d) 6 (8), pp. 553-68, below.

³ Ibid., p. 171; cf. Eliot, op. cit., pp. 266-7.

⁴ It is noteworthy that, while the Zen religion appealed to soldiers at least as strongly as Nichiren's, the Zen was nevertheless free (except for the eccentric Fukeshū or Komusō variant of it, which became fashionable among *rōnin* and outlaws: see Eliot, op. cit., p. 285) from that vein of violence which was characteristic of Nichiren's personality, conduct, teaching, and school.—A.J.T.

⁵ Anesaki, op. cit., p. 204.

⁶ See the passage quoted in Eliot, op. cit., p. 277.

⁷ See p. 97, footnote 1, above.

heretics was no murder, and that it was the duty of the Government to extirpate heresy with the sword.¹ And he condemned as heretical every Japanese school of the Mahāyāna except his own. While waiting (as it proved, in vain) for the Government at Kamakura to comply with his demand that the Hokke should be erected into the exclusively authorized and officially established religion of Japan, Nichiren intervened in the tumultuous politics of his world and age with all the vigour and self-assurance of the Prophets of Israel and Judah in the Babylonian 'Time of Troubles'.² He prophesied correctly, eight years before the menace became imminent, that Japan would be invaded by the Mongols, and incorrectly,³ when Qubilay's envoys duly arrived to demand the payment of tribute, that Japan would succumb to the formidable invader unless the Government adopted the prophet's own creed as the national religion.⁴

In view of this attitude and behaviour, it is not surprising that Nichiren should have been perpetually at loggerheads with the public authorities and that on one occasion he should have come within an ace of losing his head. It may seem more remarkable at first sight that the exponents of Zen and of Amidism, including the gentle Hōnen himself, should likewise have suffered persecution. The truth perhaps is that the gentle as well as the violent prophets who arose in Japan in 'the Kamakura Age' were suspect of being subversive in effect, even if not in intention, in virtue of that deep concern for the salvation of Mankind in the mass which was the common, and the dominant, feature of all four schools alike. And, during the hundred years running from the outbreak of the War of Onin in A.D. 1467 to the assumption of dictatorial powers *de facto* by Nobunaga in A.D. 1568, the atrocity of the age⁵ drove the Jōdo Shinshū as well as the Hokke into militancy.⁶

The Russian and the Arabic Internal Proletariat.

In the disintegration of the Orthodox Christian Society in Russia we can watch the recruitment of an internal proletariat from three different sources. One contingent was furnished by the children of the household in the persons of those Russian religious sectaries and political recalcitrants who were expelled or deported to the fringes of an expanding Russian Orthodox Christendom.⁷ A second constituent element was provided by the children of alien civilizations—Western Christians in the Balticum

⁷ See II. D (vi), vol. ii, p. 222, above.

and Lithuania and Poland and Finland; Iranic Muslims in the Caucasus and Transoxania—who were incorporated by conquest. If our analogy is to hold, the third ingredient in the Russian internal proletariat should consist of broken-in barbarians; and this ingredient was in fact supplied by the primitive peoples of the Arctic zone—Samoyeds and Lapps and Uralian Finns; Tungus and Yakuts and Palaearctics—and by the corralled Nomads of the Great Eurasian Steppe.¹ Thus the three elements with which we have become familiar in the Hellenic case all duly contributed to the formation of the Russian internal proletariat; and we can watch this proletariat making its first essays in the two alternative reactions to oppression. The violent way is exemplified in the peasant revolts under the Cossack leadership of Stenka Razin (A.D. 1667–71) and Pugachev (A.D. 1773–4); the gentle way in an accentuation, among certain Russian sects, of the vein of quietism that runs through Orthodox Christianity. That, however, is as far as we can follow the spontaneous development of an internal proletariat in the disintegration of the Russian Orthodox Christendom; for at that point in her history Russia sought and obtained admission to membership in the Western Society, and the remaining acts of the Russian tragedy have been played out, to order, on a wider stage, as incidents in a Western drama.

This same process of Westernization has overtaken the formation of an internal proletariat of the Arabic Society out of the primitive societies of Tropical Africa—and this at a still earlier stage. We catch a glimpse of Moroccan matchlockmen anticipating in the last decade of the sixteenth century of the Christian Era the nineteenth-century French and English conquest of the Sudan.² And we catch another glimpse of 'Umānī and Zanzibarese Arabs emulating in East Africa in the nineteenth century the atrocities which were practised in West Africa during the three preceding centuries by European slave-traders. But these Arabic exploits were a mere prelude to the great African tragedy which is being played in our day; and although, as we watch the present first act of this tremendous drama, we cannot yet guess how the fifth act will turn out, we do already know who are the principal dramatis personae, and we can certify that the Arabic stage-villain of the curtain-raiser is now no longer on the boards. The African play, like the Russian play, has been worked into our Western plot; and it is as a member of our all-embracing Western internal proletariat

¹ For this Russian feat of corraling the Eurasian Nomads see Part III. A, vol. iif, pp. 18–19, above, and V. C (i) (c) 3, in the present volume, pp. 313–15, below.

² Using the term 'Sudan' in its proper comprehensive sense to include the whole borderland between Tropical Africa and the Afrikan Steppe in all its breadth, from the western escarpment of the Abyssinian Plateau to the debouchure of the Senegal River into the Atlantic.

that the African Negro will have to say his lines and to do his business in his native continent as well as in North America.¹

Internal Proletariats under Alien Universal States.

A curious spectacle is offered by one group of disintegrating civilizations in which, after the indigenous dominant minority has been annihilated or dethroned, the course of outward events still proceeds on normal lines—as though we were watching the dismantled hulk of a derelict society being carried along by some kind of social momentum on a course that had been set by the navigator before the ship's officers shot each other down and the sailors furled the sails and unstepped the masts and a passing pirate placed a prize-crew on board. We have already taken note of three societies—the Hindu, the Far Eastern in China, and the Orthodox Christian in the Near East—which have all duly passed through a universal state on the road from breakdown towards dissolution, but have each received this universal state as a gift—or an imposition—from alien hands instead of constructing it for themselves.² Iranic hands have supplied one universal state to the main body of Orthodox Christendom in the shape of the Ottoman Empire, and another to the Hindu World in the shape of the Timurid Empire which was staked out by Bābur and built up by Akbar. British hands have since reconstructed this jerry-built Mughal Rāj in India from the foundations. In China it has been the Mongols—uncouth Nomads faintly tinged with a dilution of the Far Eastern Christian culture³—that have played the Ottoman or Mughal part, while the work of reconstruction on a firmer basis, which the British have attempted in India, has been attempted in China by the Manchus.

When a disintegrating society is thus compelled to invite—or admit—some alien architect to furnish it with its universal state, it is confessing that its own indigenous dominant minority has become totally incompetent and sterile; and the inevitable penalty for this premature senility is a humiliating disfranchisement. The alien who comes in to do a dominant minority's work very naturally arrogates to himself a dominant minority's prerogative; and in an alien-built universal state the whole of the indigenous dominant minority is thus degraded to the ranks of the internal proletariat. The Mongol or Manchu Khāqān and the Ottoman Pādishāh and

¹ For the religious response of the African Negro to the challenge of being conscripted into the internal proletariat of the Western Civilization through being enslaved and transported to the American side of the Atlantic see II. D (vi), vol. ii, pp. 218–20, above.

² For the hostility that is apt to be aroused by alien builders of universal states see further V. C (i) (c) 4, pp. 347–51, below.

³ See II. D (vi), vol. ii, pp. 237–8, and II. D (vii), Annex VIII, vol. ii, above, and V. C (i) (c) 4, in the present volume, pp. 348–51, below.

the Mughal or British Qaysar-i-Hind may still find it convenient to employ the services of the Chinese litteratus or the Greek Phanariot¹ or the Hindu Brahman as the case may be; yet although, in the servant's role, the dispossessed master may still extort our admiration by his doggedness in clinging to a remnant of his former power or by his flexibility in adapting himself to the discomfort of his present *peripeteia*, he cannot hide the fact that he is degraded in his soul as well as in his status. It is evident that in a social situation like this, where a *ci-devant* dominant minority has become confounded in a common abasement with an internal proletariat upon which it has once looked down with disdain, we are unlikely to find the process of disintegration working itself out to the end on genuinely normal lines under the hollow shell of an outward normality that has been preserved by the intervention of alien hands; and, if the normal symptoms can be detected at all, we shall not be surprised if they are faint and transitory and rudimentary.

In the internal proletariat of the Hindu Society in our own generation we can discern the now familiar twofold proletarian reaction in a contrast between the murders committed by a militant school of Bengali revolutionaries and a Non-Violence preached by the Gujarati mahatma Gandhi;² and we can infer a longer past history of proletarian fermentation from the presence of a number of religious movements and organizations in which the same two contrary veins of Violence and Gentleness are likewise both represented. In Sikhism we see a formidable hailstone that has congealed out of the etherial speculations of Kabīr (*vivebat saeculo quintodecimo aevi Christiani*);³ and this warlike proletarian syncretism of Hinduism and Islam has its anathesis in the Brahmō Samāj, a sect in which Hinduism has been compounded with a nineteenth-century Liberal Protestant Christianity by the rarefied spirit of Ram Mohan Roy (*vivebat A.D. 1772-1833*).⁴

¹ For the Phanariots see II. D (vi), vol. ii, pp. 222-8, above.

² It is interesting that in the India of our day the protagonist of Gentleness should be a Gujarati and the protagonists of Violence Bengalis, considering that there is a much stronger vein of enterprise and efficiency in the provincial ethos of Gujarat than in that of Bengal. For the present contrast in ethos between Bengal and the Bombay Presidency see II. D (v), vol. ii, pp. 127-33, above. For the nature of Mr. Gandhi's creed and tactic of Satyagraha see further V. C (i) (c) 2, Annex III, pp. 588-9, below.

For the progressive militarization of the Sikh fraternity by the sixth Sikh Guru, Har Govind, and the tenth Sikh Guru, Govind Singh, and for the effect of this metamorphosis on the fortunes of the Sikh religion see Macauliffe, M. A.: 'How the Sikhs became a Militant Race' in *Supplement to the Journal of the United Service Institution of India*, vol. xxxii, July 1903, No. 152, pp. 330-58, and V. C (i) (d) 6 (δ), Annex, pp. 665-8, below.

⁴ See Farquhar, J. N.: *Modern Religious Movements in India* (New York 1919, Macmillan), chap. ii. 1.

In the internal proletariat of the Far Eastern Society in China under the Manchu régime we can see in the T'ai'p'ing movement, which dominated the Chinese social stage in the middle of the nineteenth century of the Christian Era, a work of the internal proletariat which is analogous to the Brahmō Samāj in one respect and to Sikhism in another: to the Brahmō Samāj in being a compound between an indigenous tradition and an exotic distillation of Protestant Christianity;¹ to Sikhism in crystallizing into a militant political force.

In the internal proletariat of the main body of Orthodox Christendom the 'Zealot' revolution at Salonica in the fifth decade of the fourteenth century of the Christian Era² gives us a glimpse of a violent proletarian reaction at the darkest hour of the Orthodox Christian 'Time of Troubles'—in the last generation before the Orthodox Christian Society was dragooned into a universal state by the drastic discipline of an Ottoman conquest. A vast subsequent addition to the numbers of the internal proletariat was perhaps the heaviest part of the price which Orthodox Christendom had to pay for receiving from alien hands a social service which it could not do without and yet could not provide for itself.

This addition was supplied from all the three sources which we have learnt to distinguish in the Hellenic case. In the first place the *ci-devant* Orthodox Christian dominant minority whom the 'Osmanlis displaced—that is to say, the epigoni of the old ruling class in the battered fragments of the former East Roman and Bulgarian Empires—were unceremoniously degraded to the proletarian ranks as their due historical penalty for having grossly abused their trust by bringing Orthodox Christendom to its ruin through a rake's progress of fratricidal warfare between the two leading states of the Orthodox Christian World.³ Under Otto-

¹ The T'ai'p'ing movement was, no doubt, a crude and fantastic affair by comparison with the Brahmō Samāj—as was, indeed, to be expected in view of the difference between the respective founders. While Ram Mohan Roy was a highly cultivated man who was in close personal relations with the contemporary Protestant Christian missionaries in Bengal and had a deep understanding of the genius and ethos of both the two religions which he was seeking to blend, Hung Hsiu-ch'uan was the Confucian equivalent of a Bengali 'failed B.A.'—that is to say, an unsuccessful candidate for the degree of *litteratus*—and he had heard no more than a distant and distorted echo of the exotic Western religion which fired his imagination and stimulated his will to act. His source of enlightenment was a set of Protestant Christian tracts compiled by a Chinese convert, and his first mission-field and base of operations was the secluded province of Kwangsi (see Meadows, T. T.: *The Chinese and their Rebellions* (London 1856, Smith Elder), chaps. 6-8 and 19; and Fitzgerald, C. P.: *China, A Short Cultural History* (London 1935, Cresset Press), chap. 29). The movement was named after a Sinic movement, of similar character, which broke out *circa* A.D. 184 and inaugurated the break-up of the Han Empire (as the nineteenth-century T'ai'p'ing movement was intended to break up the Manchu Empire). Meadows (op. cit., p. 439, footnote) draws a parallel between Hung Hsiu-ch'uan's Neo-T'ai'p'ing movement and Swedenborgianism.

² See IV. C (iii) (c) 2 (β), vol. iv, p. 359, above.

³ For the great Bulgaro-Roman War of A.D. 977-1019 and its fatal consequences see IV. C (ii) (b) 1, vol. iv, pp. 72-6, and IV. C (iii) (c) 2 (β), vol. iv, pp. 390-404, above.

man rule all the elements of the indigenous Orthodox Christian body social—intolerable grandes and exasperated peasantry alike—were confounded in a common proletarian subjection. At the same time this indigenous Orthodox Christian nucleus of an internal proletariat was enlarged both by the conquest of populations of alien culture and by the importation of slaves; and both those methods of making forcible additions to their proletarian man-power were practised by the 'Osmanlis from the latter part of the fourteenth to the latter part of the seventeenth century of the Christian Era on a scale which rivalled the Hellenic practice from the generation of Alexander the Great to the generation of Julius Caesar.¹

In their conquests the Ottoman Pādishāhs followed the lead, but far surpassed the range, of the native militarists whom the internecine Bulgaro-Roman struggle had carried into power in the East Roman Empire in and after the tenth century. The offensive warfare which Romanus Lecapenus and Nicephorus Phocas and John Tzimisce had opened against an expiring Syriac Society on a front which eventually came to extend from the shores of Lake Van to the coasts of Tunisia² was resumed by Selīm I and

¹ While the Ottoman and Hellenic practices of enslavement are comparable, the purpose behind the practice was not the same in the two cases; and, if we take purpose into account, as we ought to take it, in any attempt that we may make to pass a comparative moral judgement, we shall find reason to condemn the Ottoman dominant minority in the Orthodox Christian World of the fourteenth to seventeenth centuries of the Christian Era less severely than the Macedonian and Roman dominant minority in the Hellenic World of the last four centuries B.C. The purpose of the Macedonian and Roman conquerors and wastrels and hangmen began and ended with their quest for docile 'man-power' to exploit. The 'Osmanlis, whose avidity for docile 'man-power' was equally strong, did at least have in view a more reputable ultimate objective. They wanted this supply of docile 'man-power' in order to distil out of it, by a careful and elaborate system of education and selection, an *élite* which was to replenish the ranks of the ruling corporation itself. We have had occasion to study the recruitment and training of the Ottoman Pādishāh's slave-household already in another context (in Part III. A, vol. iii, pp. 31-44, above). The essence of this Ottoman system in its prime was that the Dominant Minority was recruited from the Internal Proletariat wholly and exclusively. The members of the ruling corporation were slaves who remained slaves even when they were occupying the highest posts in the civil and military administration of the Empire; and the slave's career was the sole avenue of entry, whether the slave-aspirant for office had originally been a Western Christian renegade or deserter or prisoner of war or a Russian Christian victim of the Krim Tatar slave-raiders or a tribute-child conscripted by the Ottoman Government itself from its own Greek or Yugoslav Christian subjects. This Ottoman system of recruiting the Dominant Minority from the Internal Proletariat is a particularly clear illustration of the truth—which is also true for all other disintegrating societies, as well as for the main body of Orthodox Christendom—that the barrier between Dominant Minority and Proletariat is the penalty of a moral schism and is not the expression of any difference of birth or race. The Ottoman Pādishāh's slave-household, which served as the dominant minority of Orthodox Christendom during its universal state, was of precisely the same race as the *ra'īyeh* or 'human cattle' which it acquired and tended in order to recruit itself from this stock. The Ottoman ruling corporation had been replenished by adoption as well as by natural increase ever since the first generation after its original settlement in Sultān Ōnū in the thirteenth century of the Christian Era; and in the generation of Mehmed the Conqueror—not to come down so far as Suleymān the Magnificent—there can hardly have been a drop of the immigrant Eurasian Nomad blood to be found still coursing in any 'Osmanli's veins (see II. D (vi), vol. ii, pp. 228-9, above).

² See IV. C (iii) (c) 2 (β), vol. iv, pp. 399-404, above.

Suleymān the Magnificent against the nascent Iranic and Arabic societies and was then carried up the escarpment of the Iranian Plateau on the east, and down to the coasts of the Indian Ocean on the south, and as far as the borders of Morocco on the west.¹ The still more wanton offensive warfare with Hungary in which the Comneni had indulged² at a later stage in the East Roman Empire's decline was also resumed by Suleymān the Magnificent and was carried by him up to the gates of Vienna. The impious Ottoman assaults upon the 'Osmanlis' own parent Iranic Society proved abortive; but the simultaneous attacks upon the other two societies which were likewise neighbours of the Ottoman Empire resulted in a vast addition of Arabic Muslim and Western Christian subject populations to the Orthodox Christian internal proletariat. These recruits, who were acquired through an Ottoman conquest of their native countries, were mostly permitted to serve the conquerors as hewers of wood and drawers of water without being uprooted from their homes; but there was also a constant stream of other recruits, from territories beyond the frontiers of the Ottoman dominions, who were plucked out of their native environment—either, against their wills, as prisoners of war and victims of slave-raids, or, by their own act, as deserters and renegades—in order to swell still further the already vastly swollen numbers of the internal proletariat of Orthodox Christendom under the Ottoman régime.³

Both the scale and the effects of this recruitment from abroad are revealed in the testimony of an experienced and skilful English observer who was resident in Turkey during the latter part of the seventeenth century, that is to say at a time when the recruitment from this source was on the point of coming to an end and may therefore be presumed to have dwindled already by comparison with its volume in the age of Suleymān the Magnificent or in the still further past age of Mehmed the Conqueror. In a book published in London in A.D. 1668 Sir Paul Rycaut describes⁴ how, in his day, the population of the Ottoman Empire was still being recruited by imports of slaves from the hinterland of the Black Sea Steppe; and these imports were also still on the grand scale; for the minimum estimate of the average numbers of the annual contingent imported through the single port of Constantinople is

¹ For the extent, and the limitations, of these Ottoman conquests see I. C (i) (b), Annex I, in vol. i, pp. 384-400, and II. D (vii), Annex VII, in vol. ii, pp. 444-5, above.

² See IV. C (iii) (c) 2 (β), vol. iv, p. 403, footnote 3, above.

³ For these recruits from beyond the Ottoman frontiers see Part III. A, vol. iii, p. 35, above.

⁴ Rycaut, Sir Paul: *The Present State of the Ottoman Empire* (London 1668, Starkey and Brome), pp. 80-2. Rycaut was particularly well placed for making his observations, since he served first as English consul at Smyrna and afterwards as secretary to the English Embassy in Constantinople.

placed by Rycaut as high as 20,000. The English observer then goes on to discuss the spiritual effect of this physical deracination.

'The greatest part, being women and children, with easie perswasions and fair promises become Turks; the men, being ignorant and generally of the Russian or Muscovite nation (who are reported not to be over-devout or of famed constancy and perseverance in religion), . . . renounce all interest in the Christian faith.'

In this ready renunciation of their own religious heritage these Russian slave-immigrants into Ottoman Rumelia might seem to compare unfavourably with those Oriental slave-immigrants into Roman Italy who still clung, in exile and adversity, to the worship of Cybele or Isis. It appears, however, from a later passage in the same work, that although these Russians may have drunk rather recklessly of the waters of Lethe, the draught did not altogether overcome them after all.

'We might proceed to recite as many sects as there are towns or schools in the Empire, in every one of which some pragmatistical preacher or other have always started a new opinion which can never want disciples. And certainly the diversity of opinion in Turk[e]y is almost infinite, and more numerous then in England or other parts of Christendom, though commonly not proceeding from the same malice nor laid with the same design to the prejudice of the State. The reason of this variety amongst the Turks I attribute to the many religions which voluntarily, and for interest or by force, have entered into the Mahometan superstition—many of which being Grecians, and instructed in the arts and sciences with which that empire once flourished, which was the mine and treasury of philosophy and learning, did afterwards mix with their new religions (not being wholly satisfied with the Alchoran) certain traditions and opinions of the ancient philosophers. And several other nations—as Russians, Muscovites, Circassians and the like—retaining some few remembrances of their first notions and principles, make a farther addition to this ill-compounded medley.'¹

Here was a spiritual field which had been admirably prepared, by the thorough work of a trenchant Ottoman ploughshare, to receive and foster the seed of a 'higher religion' and perhaps to bring to harvest a universal church; and the golden opportunity was not neglected by would-be sowers—as we have already observed in another context² where we have had occasion to take note of the rudiments of new religious growths which made their appearance in Orthodox Christendom under the *Pax Ottomanica*. As early as the second decade of the fifteenth century of the Christian Era, when the Ottoman Empire had only just been established

¹ Rycaut, op. cit., p. 135.

² In IV. C. (ii) (b) 1, vol. iv, pp. 68-9, above.

and had not yet been rounded off by the occupation of Constantinople, Sheykh Bedr-ed-Dīn of Simāv was propagating in the Ottoman dominions on both sides of the Straits a syncretism between Islam and Christianity which reminds us of the Islamic-Hindu syncretism of Kabīr or the Christian-Hindu syncretism of Ram Mohan Roy or the Christian-Taoist syncretism of Hung Hsiu-ch'uan; and at the turn of the fifteenth and sixteenth centuries the Anatolian provinces of the Empire were being impregnated with Imāmī Shi'ism by the missionaries of the Safawis.¹ Like Bedr-ed-Dīn in A.D. 1416,² the Safawī propagandist Shāh Qūlī blighted his own prospects in A.D. 1511 by impatiently turning from a gentle to a violent course and thereby bringing down upon himself the full weight of the Ottoman Power.³ These early violent sowers of new seed in Orthodox Christian soil were promptly crushed and their seed was trampled into the ground; but the quiet and gradual propagation of esoterically heterodox faiths, under a parade of conformity with the Sunnah, struck deeper and spread wider during the later centuries of the Ottoman Peace; and, if at the turn of the eighteenth and nineteenth centuries the process of Westernization had not followed so hard at the heels of the break-up of the Ottoman Empire, we may conjecture that, by the present day, the Bektāshī movement might have won for itself, throughout the Near East, the position which it has actually succeeded in attaining in Albania.⁴

The Ottoman Peace (*durabat circa* A.D. 1372-1774)⁵ did at least

¹ See I. C (i) (b), Annex I, vol. i, pp. 365-8, above, and V. C (i) (d) 6 (δ), Annex, in the present volume, pp. 662-5, below.

² The parallel is not quite exact, since Bedr-ed-Dīn only took to violence after his hand had been forced. The Sheykh had resigned himself to a compulsory retirement, on a pension, at Isnik, after having been deposed by Sultan Mehmed I from the high office of Qādi'l-'Asker of Rumili, which he had held from A.D. 1410 to 1413. In A.D. 1416, however, Sheykh Bedr-ed-Dīn's lieutenant Mustafā Bōrklije rose in insurrection in the natural fortress of the Qāraburun Peninsula (on the Anatolian mainland, facing the Island of Chios). On receiving the news, Bedr-ed-Dīn made his way from Isnik via Sinope to Wallachia and thence invaded the Ottoman territory of Deli Orman (in North-Western Bulgaria, between Ruschuk and Varna). In both places the insurrections were crushed by the Ottoman Government with the utmost energy and ferocity (see Babinger, Fr.: 'Schejch Bedr-ed-Din' in *Der Islam*, vols. xi and xii). It is one of the curiosities of history that the scene of Mustafā's insurrection on Qāraburun in A.D. 1416 should have been within sight of the scene of Aristonicus's at Leucae, just across the Gulf of Smyrna, in 132 B.C. (see p. 69, above); for there is an unmistakable kinship between the two movements. According to Sheykh Bedr-ed-Dīn's contemporary, the Orthodox Christian historian Michael Ducas (chap. 21), the two main planks in the Sheykh's platform were a fraternization between Muslims and Christians and a communism in everything except wives. One is reminded of Aristonicus's common call to freemen and slaves, and of his attempt to establish, in real life, the Communist Utopia of Iambulus (see V. C (i) (d) 11, Annex I, vol. vi, p. 351, below).

³ See I. C (i) (b), Annex I, vol. i, pp. 365 and 382-3, above.

⁴ For the state of the Bektāshī movement in the latter part of the seventeenth century of the Christian Era see Rycart, op. cit., Book II, chaps. 12 and 19, and also the present Study, IV. C (ii) (b) 1, vol. iv, pp. 68-9, above, and V. C (i) (c) 3, in the present volume, p. 295, below.

⁵ See Part III. A, vol. iii, pp. 26-7, and IV. C (ii) (b) 1, vol. iv, p. 68, above, and V. C (ii) (b), vol. vi, pp. 298-300, below.

last long enough for the religious ferment which attracted Rycaut's attention in the second quarter of the seventeenth century to brew up out of the *colluvies gentium*¹ that had been collected and confounded in an Ottoman sump, like the ingredients of a cocktail in a shaker, by the cumulative operation of slave-raids and wars of conquest which had been at work, by Rycaut's day, for more than three centuries. The Mongol Peace on the Steppe (*ca.* 1241-1328)² was too brief to give time for the troubling of the waters in this case to produce its normal after-effects. The foregoing-Mongol ravages, however, surpassed the Ottoman ravages in material scale in the measure of the difference in physical magnitude between the main body of the Far Eastern Society and the main body of Orthodox Christendom. While the alien Ottoman builders of an Orthodox Christian universal state ranged beyond the proper bounds of the society on which they were imposing their peace as far afield as Hungary and Azerbaijan and the Yaman and Algeria, the alien Mongol builders of a Far Eastern universal state likewise pushed their raids as far as Hungary in a westerly direction, while eastward they subjugated Korea and southward invaded Burma. From all quarters of the immense tract of European and Asiatic territory that was comprised within these extreme limits, the Mongol stockmen 'lifted' droves of human cattle from their native pastures and herded them together in human cattle-pens which they had hastily constructed in the heart of the Eurasian Steppe. The multiplicity and variety of the diverse cultures which were thus forced into an involuntary intercourse with one another as a result of this titanic Mongol 'round-up' might have produced a social and spiritual ferment of unexampled energy if the Mongol Peace had not fallen short of the Ottoman Peace in its Time-span as signally as it surpassed it in its spacial extension.

In the event the *Pax Mongolica* collapsed, after its ephemeral heyday, as suddenly and unexpectedly as it had sprung into existence; and, upon its collapse, the *colluvies gentium* which had been swept together at Saray-on-Volga and at Qaraqorum-on-Orkhon and at Peking-within-the-Wall either dispersed and evaporated or was absorbed and assimilated or was segregated and sterilized without having been given the time to fulfil its 'manifest destiny' of 'making history'. The sensational history which might have been made in 'the Cauldron of the North',³ if Time and Chance had been auspicious, will leap, however, to

Jer. i. 13; Ezek. xi. 3 and 7, and xxiv. 1-14.

the eye of any reader of the surviving narratives of those Western observers who visited the head-quarters of the Mongol Khāqān and broke their long journey at the camps of his vassal-princes in the outlying appanages of the Mongol Empire on the morrow of its establishment.¹ For a moment of time in the thirteenth century of the Christian Era Saray and Qaraqorum and Peking bade fair to become as potent 'melting-pots' as a nineteenth-century New York or as a Rome whose dilution of the Tiber with the Orontes has been immortalized in famous lines of Juvenal that have already been quoted.² The fact is attested by the following passages from the pen of a Flemish friar of the Franciscan order who made his adventurous journey to Qaraqorum and back in A.D. 1253-5.

'There is a fair or market following the court of Bātū at all times; but it was so far distant from us that we could not reach it. We were constrained to walk on foot for want of horses. At length certain Hungarians, who had once been clerks, found us, and one of them could sing many songs without book, and was looked upon by other Hungarians as a priest, and was sent to funerals of his deceased countrymen. There was another of them also well instructed in grammar; for he could understand the meaning of everything that we spoke, but could not answer. These Hungarians were a great comfort to us, bringing us *cosmos* [qumyz] to drink, and sometimes flesh to eat. . . .

'Upon a certain day a Cuman accompanying us saluted us in Latin, saying *Salvete, domini*. Wondering at this, and saluting him in return, I demanded of him who had taught him that kind of salutation. He said that he was baptized in Hungary by our friars, and that from them he had learned it. . . .

'I inquired . . . of the city of Talas, where there lived certain Teutons . . . of whom Friar Andrew made mention.³ Concerning these men, I also inquired very diligently in the courts of Sartak and Bātū, but I could get no information of them . . . till I had come to the court of Mangū Khan. And there I was informed that Mangū Khan had removed them out of the jurisdiction of Bātū, for the space of a month's journey from Talas, eastward, to a certain village called Bulaq, where they are set to dig gold and to make armour. . . .

'A few days later we entered upon those alps where the Qāra Qitay people were wont to inhabit. . . . And there we found a certain village where there were Saracens, speaking the Persian language, though they dwelt a huge distance from Persia. . . .

[At Qaraqorum, where the Khāqān Mangū held his court,] 'we

R.: *The Texts and Versions of John de Plano Carpini and William de Rubruquis* (London 1903, Hakluyt Society), and Komroff, M.: *Contemporaries of Marco Polo* (London 1928, Cape).

² On p. 67, above.

³ This Friar Andrew had visited the court of the Mongol Khāqān in the reign of Kuyuk Khan (*imperabat* A.D. 1246-8).—A.J.T.

went to a large house that we found cold and without a supply of fuel. We were still without food, and it was night. . . . A woman of Metz in Lorraine, called Paquette, and who had been a prisoner in Hungary, found us out and prepared for us a feast of the best she could. She belonged to the court of that lady who was Christian and of whom I have already spoken; she told us of the unheard-of misery she had suffered before coming to the court. But she was fairly well off, for she had a young Russian husband who made her the mother of three little children, and he was a carpenter, which is a good position among the Tatars. Among other things, she told us that there was in Qaraqorum a goldsmith named William, originally from Paris. His family name was Buchier, the name of his father Laurant Buchier. She believed, too, that he had a brother who lived on the Grand Pont and who was called Roger Buchier. . . .

'On Palm Sunday [A.D. 1254] we were at Qaraqorum. . . . The mass said, evening approached, and Master William took us with him to his home for supper, in great joy. His wife was the daughter of one Lorraine, and born in Hungary. She spoke French and Cuman well. We met there another European named Basil, the son of an Englishman and born in Hungary, and who spoke the same languages.'¹

These fellow Western Christians with whom the Flemish Friar William fell in at Qaraqorum and on his journey thither were only one of many contingents of *déracinés* whom the Mongol raiders had carried away captive to the mushroom-capital of an embryonic Far Eastern universal state. Among the new recruits who were thus forcibly levied and conscripted into a Far Eastern proletariat there were also Orthodox Christian Alans and Russians; there were Muslim Turks and Iranians and Monophysite Christian Armenians from an aged Syriac World to which the Mongol invaders had dealt a *coup de grâce*;² there were Lamaist Mahayanian Buddhists from Tibet; there were Catholic Mahayanian Buddhists and Taoists and Confucians from China; and there were the Manichaeans and the Nestorian Christians who were already long since at home in the oases of the Eurasian Steppe³ before Chingis Khan started on his career of conquest. In the course of his anabasis Friar William was not only consoled and fortified by meeting co-religionists: he was also stimulated or exasperated, according to the circumstances, by encounters with representatives of the competing faiths. At an early stage in his journey, on Whitsun Eve, 1253, he was approached by

² See I. C (i) (b), vol. i, p. 72; II. D (vii), Annex VIII, vol. ii, pp. 449-52; IV. C (ii) (b) 1, vol. iv, p. 67, above.

³ For the infiltration of Manichaeism and Nestorian Christianity from the Syriac World into the Far East see II. D (vi), vol. ii, pp. 237-8; II. D (vii), vol. ii, p. 375; II. D (vii), Annex VIII, vol. ii, pp. 449-50, above.

some Alan adherents of the Orthodox Church who besought this passing Western priest for instruction in Christian doctrine and observance.¹ On Whitsunday itself he was approached by a Muslim whom he instructed and all but converted.² He found Bātū Khan's son Sartak under the influence of Nestorian counselors, and suspected the prince of being a crypto-Nestorian himself.³ When he arrived at Bātū's own court, he raised a laugh among the courtiers by boldly adjuring their master to embrace the Catholic Faith.⁴ In his passage through Uighuristan he visited a Buddhist temple and entered into a theological disputation with the monks.⁵ After his arrival at Qaraqorum the first trace of Christianity upon which he stumbled was a chapel served by an Armenian monk;⁶ and thereafter he found 'a swarm of Christians—Hungarians, Alans, Ruthenians, Georgians, Armenians'⁷—in the Khāqān's capital. When Mangū Khan granted Friar William an audience, the missionary preached the Catholic Faith to the Khāqān as boldly as he had preached it to Mangū's cousin Bātū; and Mangū responded by arranging for the holding of a theological disputation.⁸ His secretaries first took down in writing depositions from the friar and his Nestorian and pagan competitors, and thereafter the three parties were called upon to defend their respective theses by word of mouth before a board of examiners consisting of one pagan, one Muslim, and one Christian. In a subsequent interview Mangū expounded his own religious beliefs in a latitudinarian vein which the Mongol Emperor's Catholic interlocutor interpreted as a confession of agnosticism.⁹

It will be seen that, at this early stage in the history of the universal state which was being imposed on the Far Eastern World by Mongol arms, the competition between the diverse religions of the *déracinés* from all quarters of the Earth who were then being thrown into a Far Eastern 'melting-pot' was already exciting the curiosity of the Mongol master of this enormous empire. And on this showing we may surmise that, if the

Pax Mongolica had lasted, some notable religious experiences and discoveries would have followed. As it was, the Mongol khans and hordes of the several branches of the House of Chingis did all eventually exchange their own primitive paganism for one or other of the 'higher religions' of the peoples, west of the Great Wall, who were temporarily engulfed in the Far Eastern internal proletariat as a result of the Mongol conquests. Mangū Khan's own brother and successor Qubilay Khan (*imperabat* A.D. 1257-94) was attracted by his Tibetan subjects' Lamaistic Mahayanian Buddhism; and this was the religion to which his successors were tardily converted some two hundred years after their expulsion from China.¹ Their cousins in the appanages of Chaghatai and Jūji were converted to the orthodox Sunnī form of Islam,² and so, in the end, were the Il-Khans of Iran and 'Irāq, after they had tried, as alternatives, both Nestorianism and the Shi'ah.³ On the other hand the Mongol Empire broke down and broke up before any of these alien faiths had gained any deep or lasting hold upon the mass of the Far Eastern internal proletariat in Intramural China.

The tincture of Western Christianity which was introduced into the Far East under a Mongol aegis by a series of pioneer-missionaries—from Friar John of Pian di Carpine, who made his journey to Kuyuk Khan's court in A.D. 1245-7, to Friar Odoric of Pordenone, who visited Peking in the third decade of the fourteenth century—had evaporated without leaving a trace by the time when Saint Francis Xavier inaugurated the second attempt to convert China to Catholicism; Nestorianism and Manichaeism seem to have been absorbed into the Chinese tradition without making any visible mark on it; and even Islam, though it did succeed in gaining a permanent foothold in China thanks to the opportunities which it temporarily enjoyed there under the Mongol régime, remained segregated in the far north-western provinces of Kansu and Shensi and in the new far southern province of Yunnan which was carved out of a barbarian no-man's-land by Mongol military enterprise. The Muslim element which survives down to this day in the Chinese population of these three provinces is the most substantial monument, in China, of the short-lived and abortive alien universal state which the Mongols once provided for a disintegrating Far Eastern Society. Yet, although this exotic community has contrived to hold its

ground on the fringes of China, it has remained, even there, a peculiar people; and on Chinese ground there has been no fruitful union between Islam and any indigenous religion or philosophy. The student of the morphology of Religion will search in vain for any Chinese counterpart of the Indian syncretisms between Islam and Hinduism or the Near Eastern syncretisms between Islam and Christianity. To find a Chinese analogue of Kabirism and Sikhism and Bedreddinism and Bektashism the observer must travel far afield in both Time and Space. He must skip the Ming interlude between the Mongol and the Manchu régime, and must then shift the focus of his attention from the hinterland of Peking in the thirteenth century to the hinterland of Canton in the nineteenth century, if he wishes to catch a glimpse of a dynamic impact of alien religious ideas upon the native Chinese tradition. As we have seen above,¹ it was in Kwangsi in the middle of the nineteenth century, when the Manchu régime, in its turn, was verging towards its fall, that some casual grains of Protestant Christianity, mingling with the traditional Chinese *Weltanschauung* in the soul of a Hung Hsiu-ch'uan, produced the explosive mixture which discharged itself in the militant movement of the 'T'ai'ping'.

The Babylonian and the Syriac Internal Proletariat. •

If we now pass to the Babylonian World, we shall find that the ferment of religious experience and discovery in the souls of a sorely tried internal proletariat was as active in South-Western Asia under the Assyrian terror of the eighth and seventh centuries B.C. as it was, round the Hellenized shores of the Mediterranean Basin, under a Roman terror which set in with the outbreak of the Hannibalic War and did not give way to a Roman Peace until after the Battle of Actium.

Through the agency of Assyrian arms the disintegrating Babylonian Society expanded geographically in two directions, as the disintegrating Orthodox Christian Society expanded through the prowess of the East Roman militarists² and their successors the 'Osmanlis, and the disintegrating Hellenic Society through the conquests of alien ground that were made by the Macedonians and the Romans. Eastward, beyond the Zagros, in Iran, the Assyrians anticipated the Romans' exploits in Europe beyond the Appennines by subjugating a host of primitive societies; westward, beyond the Euphrates, they anticipated the Macedonians' exploits on the Asiatic side of the Dardanelles by subjugating

¹ On p. 107.

² See IV. C (iii) (c) 2 (β), vol. iv, pp. 399-403 and p. 403, footnote 3, above.

more than one alien civilization; and the two alien civilizations—the Syriac and the Egyptiac—which were thus forcibly incorporated, for the moment, into the Babylonian internal proletariat were actually identical with two of the four which were afterwards temporarily incorporated into the Hellenic internal proletariat *post Alexandrum*. Nor were these alien victims of Babylonian militarism simply conquered without being uprooted. The classic examples of the forcible deportation of a conquered population are the transplantation of the Israelites by the Assyrian war-lord Sargon to the opposite frontiers of an expanding Babylonian World in the recently subjugated barbarian country on the western fringes of Iran, and the transplantation of the Jews by the Neo-Babylonian war-lord Nebuchadnezzar to the heart of the Babylonian World in Babylonia itself.

The compulsory exchange of populations was the sovereign device of Babylonian imperialism for breaking the spirit of conquered peoples and, above all, destroying their political *esprit de corps*; and the atrocity was by no means exclusively inflicted upon aliens and barbarians. In their own fratricidal warfare the dominant Powers of the Babylonian World did not scruple to mete out the same treatment to one another; and the Samaritan community¹—of which a few hundred representatives can be seen, still living under the shadow of Mount Gerizim, in the present mandated territory of Palestine—is a monument of the transplantation to Syria, by Assyrian hands, of deportees from several cities of Babylonia, including the metropolis itself. The Assyrian Government's intention was to wipe out the national consciousness of the proudest and most venerable of the four sister nations² in the Babylonian body social, and at the same time to fill a vacuum which had been left in the recently conquered territories in Syria after the transplantation of a number of the native Israelites to Media;³ but in the end it was the Babylonians with their Median allies, and not the Assyrians, who emerged victorious from the Assyro-Babylonian Hundred-and-Forty Years' War;⁴ and at that stage it was both impossible and unnecessary for the Babylonians to deal with the Assyrians as the Assyrians had

¹ See Gaster, M.: *The Samaritans* (Oxford 1923, University Press).

² See I. C (i) (b), vol. i, p. 116, and II. D (v), vol. ii, pp. 135 and 137, above.

³ The Assyrians seem not to have deported entire populations *en masse*, but to have contented themselves with carrying away captive certain selected classes—the political-minded or the skilful-handed—while the peasantry were left, helpless and leaderless, on their ancestral lands. Both the Israelites who were planted in the cities of the Medes and the Babylonians who were planted in the cities of Israel were probably minorities; and the survival of an Israelitish peasantry in the countryside of Samaria would account for the eventual victory of the indigenous Syriac over the intrusive Babylonian element in the Samaritan religion (see p. 125, footnote 1, below).

⁴ For this devastating war and its outcome see IV. C (iii) (c) 3 (a), vol. iv, pp. 476–84, above.

dealt with them; for by that time there were no more Assyrians left to deal with. By intercalating recurrent domestic revolutions between their perpetual foreign wars, the Assyrians had achieved the extraordinary feat of annihilating themselves;¹ and, apart from a miserable remnant of squatters who continued to preserve the Assyrian name on the site of the city of Asshur itself,² perhaps the only survivors of the Assyrian nation were the offspring of Assyrian garrisons in the former provinces of the Assyrian Empire who purchased their survival at the price of losing their political identity and being absorbed into the surrounding native population. In the Assyrian homeland itself the Assyrian nation was being supplanted by its Syriac victims even before the collapse of the Assyrian state, as is attested by the progress of the conquered peoples' Aramaic language at the expense of the conquerors' Akkadian.³

It will be seen that the *furor Assyriacus* did not spend itself before it had brought into existence a Babylonian internal proletariat which bore a singularly close resemblance to the Hellenic internal proletariat in its origin and composition and experience; and the two trees brought forth similar fruits. While the later incorporation of the Syriac Society into the Hellenic internal proletariat was to bear fruit at the beginning of the Christian Era in the birth of Christianity out of Judaism, the earlier incorporation of the same Syriac Society into the Babylonian internal proletariat bore fruit in and after the eighth century B.C. in the birth of Judaism itself out of the primitive religion of one of the parochial communities into which the Syriac Society had come to be articulated.⁴

¹ See IV. C (iii) (c) 3 (α), vol. iv, pp. 480-2, above.

² Ibid., p. 470, above.

³ For this victory of Aramaic over Akkadian see I. C (i) (b), vol. i, p. 79, and IV. C (iii) (c) 3 (α), vol. iv, p. 484, above, and V. C (i) (d) 6 (γ), in the present volume, pp. 487-91 and 499, footnote 5, below.

⁴ For the nature of the primitive religion of Israel see IV. C (iii) (c) 2 (α), vol. iv, p. 262, above, and V. C (i) (d) 7, vol. vi, pp. 39-49, below. It will be seen that, while Judaism and Christianity appear to be 'philosophically contemporary and equivalent' (in the sense in which these terms have been used in I. C (iii) (c) and (d), vol. i, above) in so far as they can be regarded simply as products of the disintegration of two societies of the species which we have called 'civilizations', there is another angle of vision from which they present themselves in the quite different aspect of successive stages in a single 'ascending' process of spiritual enlightenment. In this picture Christianity stands, not side by side with Judaism, but on its shoulders, while they both tower above the primitive religion of Israel. Nor is the enlightenment of the Prophets of Israel and Judah in and after the eighth century B.C. the only intervening stage of which we have a record or a hint in the chronological and spiritual interval between the primitive worship of Yahweh and the epiphany of Christ. Before and below the Prophets, the Biblical tradition presents us with a Moses, and before and below Moses with an Abraham. These dim figures are regarded by one school of modern Western 'higher critics' as mere creatures of a primitive mythopoeic imagination, and by another school as at least partially authentic historical persons who have left their marks upon 'folk memory'. The student of history will observe that the tradition places both Abraham and Moses in the same historical setting as the Prophets and as Christ, if history is regarded as a conspectus of the rises and falls of civilizations. While Christ made his

The genesis of this 'higher religion' of Judaism among the submerged Syriac elements in the Babylonian internal proletariat has left an incomparably full and clear record of itself in the books of the pre-Exilic Prophets of Israel and Judah; and in these living and breathing memorials of a tremendous spiritual travail the burning question is the issue—already familiar to us from the Hellenic case—between the gentle and the violent way of facing an internal proletariat's ordeal. Moreover, Gentleness eventually prevailed over Violence in this case likewise; for the 'Time of Troubles', as it reached and passed its climax, delivered a series of hammer-stroke lessons which taught even the 'Die-Hards' in the tribe of Judah the futility of attempting to repay Violence in its own kind. The new 'higher religion' which was born in eighth-century Syria, in Syriac communities which were then still being pounded on their native threshing-floor by an Assyrian flail, was brought to maturity in sixth-century and fifth-century Babylonia among the uprooted and deported descendants of one of these battered Syriac peoples.

Like the Oriental slave-deportees in Roman Italy, the Jewish exiles in Nebuchadnezzar's Babylon were proof against the facile adaptability of the Russian slave-deportees in Ottoman Rumelia.¹ These uprooted Syriac members of the Babylonian internal proletariat were no chameleons.

'If I forget thee, O Jerusalem, may my right hand forget her cunning.

'If I do not remember thee, let my tongue cleave to the roof of my mouth.'²

Yet the memory of their home which these exiles cherished in a strange land was not just a negative imprint: it was a positive act of inspired imaginative creation. In the unearthly light of this vision seen through a mist of tears the fallen fastness became transfigured into a holy city built on a rock against which the gates of Hell should not prevail.³ And the captives who refused to indulge their captors' whim by singing them one of the songs of Sion, and stubbornly hanged up their harps on the willows⁴ by Euphrates' stream, were at that very moment composing an inaudible new melody on the invisible instrument of their hearts.

appearance in This World just after the close of a Hellenic 'Time of Troubles' and the Prophets made theirs in the midst of a Babylonian 'Time of Troubles', the epiphany of Moses is traditionally associated with the decadence of 'the New Empire' of Egypt, which was a restoration of the Egyptian universal state, and the epiphany of Abraham with the last days of the Sumerian universal state, after its short-lived reconstruction by the energetic hands of Hammurabi. This relation between recurrent break-downs and disintegrations of civilizations and an apparently progressive process of religious enlightenment is examined further in Part VII, below.

¹ See the present chapter, p. 110, above.

² Ps. cxxxvii. 5-6.

³ Matt. xvi. 18.

⁴ Ps. cxxxvii. 1.

'By the waters of Babylon we sat down and wept when we remembered thee, O Sion';

and, in that weeping, the enlightenment of Jewry was accomplished.

It is evident that, in the successive religious reactions of Syriac conscripts in the ranks of an alien internal proletariat, the parallel between Babylonian and Hellenic history is very close; but the response evoked from the internal proletariat by the Babylonian dominant minority's challenge was the richer of the two in so far as it came not only from those victims who were members of an alien civilization but from the barbarian victims as well. Whereas the European and North-West African barbarians who were forcibly incorporated into the Hellenic internal proletariat by Roman arms made no religious discoveries of their own, but simply accepted the seed that was sown among them by their fellow proletarians of Oriental origin, the Iranian barbarians who were passed under the Assyrian harrow begot a native prophet in the person of Zarathustra, the founder of Zoroastrianism. The date of Zarathustra is a matter of dispute among modern Western scholars, and by the same token they are unable to tell us whether his religious discovery was an independent response to the common challenge of Assyrian militarism which was presented to Iranians and Syrians simultaneously, or whether his voice was only an echo of the cry of Israelite prophets who had been marooned in 'the cities of the Medes'.¹ It is evident, however, that, whatever the original relations between these two 'higher religions' may have been, Zoroastrianism and Judaism met on equal terms in their maturity and that, in their spiritual commerce during the Achaemenian and the Macedonian Age, the Iranian religion gave the Syrian religion at least as much inspiration as it received from it.² The spiritual power that was thus displayed by Zoroastrianism in the second chapter of its history is presumptive evidence that the new 'higher religion' of the barbarian wing of the Babylonian internal proletariat was a powerful spiritual force from the beginning.³

¹ This question has been touched upon already in I. C (i) (b), vol. i, p. 81, above. See further Pettazzone, R.: *La Religione di Zarathustra* (Bologna 1920, Zanichelli), pp. 82-4. It may be noted in this connexion that the human adversaries who are equated in the Gāthās with the Powers of Evil are not the Assyrians but the Eurasian Nomads, who swept out of the Steppe on to the Iranian and Anatolian plateaux in the seventh century B.C. (see II. D (v), vol. ii, pp. 136-7 and 138-9, and Part III. A, Annex II, vol. iii, p. 410, above).

² See von Gall, A.: *Βασιλεία τοῦ Θεοῦ* (Heidelberg 1926, Winter), *passim*, and Meyer, E.: *Ursprung und Anfänge des Christentums*, vol. ii (Stuttgart and Berlin 1921, Cotta), pp. 95-120, 179, and 190-204, as well as the present study, V. C (i) (d) 6 (δ), in the present volume, p. 536; V. C (i) (d) 7, vol. vi, pp. 43-4; V. C (i) (d) 9 (γ), vol. vi, p. 126, footnote 5, and p. 129, footnote 2; and V. C (i) (d) 11, vol. vi, p. 163, footnote 1, below.

³ For the remarkable vein of intellectual abstraction which appears to have been one of the original features of Zarathustra's system see V. C (i) (d) 7, vol. vi, p. 43, footnote 4, below.

At any rate, when the Babylonian 'Time of Troubles' was brought to an end by the overthrow and annihilation of Assyria, and the Babylonian World passed on into a universal state in the shape of the Neo-Babylonian Empire, it looked as though Judaism and Zoroastrianism—the new faiths of the Syrian and Iranian wings of the Babylonian internal proletariat—would compete with one another for the privilege of establishing a universal church within the political framework that was now being provided by the Babylonian dominant minority—as, in the disintegration of the Hellenic body social, Christianity and Mithraism and the worships of Isis and Cybele did compete with the weapons of the spirit in the arena of the Roman Empire. At this juncture, however, the course of history was abruptly changed by a sudden and dramatic reversal in the relations between the apparently victorious Babylonian and the apparently vanquished Syriac Society.

This *peripeteia* was the retribution for the unusual deadliness of the injury which the Babylonian dominant minority had inflicted upon itself, during the Babylonian 'Time of Troubles', as well as upon the alien societies within striking distance. Out of the four national states—Babylonia, Assyria, Elam, and Urartu—into which the Babylonian body social had been articulated, one—Assyria—had been annihilated and two others—Elam and Urartu—had been prostrated and overwhelmed by the beginning of the sixth century B.C.; and the sole survivor—Babylonia—who was left to establish the Babylonian universal state, was suffering too severely from the shock of the Assyro-Babylonian Hundred-and-Forty Years' War to be capable of executing this heavy task single-handed. Babylonia could never have carried the long duel with her far more powerful Assyrian sister to a victorious conclusion if the Iranian barbarians had not lent her their formidably decisive aid;¹ and, while the Neo-Babylonian Empire was attempting to serve as a Babylonian universal state, it was living all the time under the shadow of a Median peril. This peril might perhaps have been exorcized, or at any rate mitigated, if the menacing barbarians had been converted to the Babylonian Civilization; but, as we have seen, the Iranians were actually converted to the Syriac Civilization instead;² and therewith, for Nabonidus and Belshazzar, the menace of a barbarian avalanche was merged in the still more terrible menace of a Syriac encircle-

¹ In this respect Babylonia's victory over Assyria with the aid of Median arms at the close of the seventh century B.C. may be compared with France's victory in A.D. 1918 over Germany with the aid of the English-speaking Powers. In A.D. 1938 it looked as though the same historical drama might be re-acted by China, Japan, and the Soviet Union.

² See I. C (i) (b), vol. i, pp. 79-81; II. D (v), vol. ii, pp. 137-8; IV. C (iii) (c) 3 (a), vol. iv, p. 471, above.

ment. The blow fell; the roles were reversed; the Achaemenian Empire supplanted the Neo-Babylonian Empire as the political framework within which the two rising religions of Judaism and Zoroastrianism were to propagate themselves; and the Achaemenian Empire was a Syriac and not a Babylonian universal state; for it was an empire in which the Babylonians found themselves a subject and aggrieved instead of a ruling and self-satisfied community,¹ while the new Iranian masters of South-Western Asia allowed the Babylonians' Jewish victims to return from exile to their Syrian fatherland and took the Babylonians' Phoenician vassals into an honourable partnership in the management of an empire which dwarfed Nebuchadnezzar's.²

¹ See the present chapter, p. 94, above, and V. C (i) (c) 4, in the present volume, p. 347, and V. C (ii) (a), Annex II, vol. vi, p. 442, below.

² Under the Achaemenian régime the four Phoenician city-states—Sidon, Tyre, Byblus, Aradus—each not only enjoyed their own local autonomy, but were actually allowed by the Achaemenian Imperial Government to reign respectively over four miniature *imperia in imperio*. The island city-state of Aradus was mistress on the mainland of a territory which included Marathus and Mariamme and extended eastward from the coast into the interior right up to the Orontes. On Sidon the Achaemenidae bestowed the Plain of Sharon, including Dora and Joppa, while Tyre bore rule over Ascalon and over some city, unidentified, on the coast of the Bay of Acre. Gaza and Ashdod seem to have been the only two Philistine cities that escaped 'mediatization' (to use the corresponding technical term in the constitutional vocabulary of the Holy Roman Empire) and that continued to depend directly upon the Achaemenian Pādishāh instead of being subordinated to one or other of the four Phoenician imperial cities (see Jones, A. H. M.: *The Cities of the Eastern Roman Provinces* (Oxford 1937, Clarendon Press), pp. 234-5). In the fourth century B.C. the Phoenician city-states were federated with one another—the seat of the federal institutions being at Tripolis (Jones, op. cit., pp. 231-2; Meyer, E.: *Geschichte des Altertums*, vol. iii (Stuttgart 1901, Cotta), pp. 138-40). On the other hand the general Achaemenian policy of studied respect for pre-existing local institutions—political, legal, and religious—was eventually defeated in Babylonia by the irreconcilable hostility of the Babylonians to an alien dominion, however moderately exercised and discreetly veiled. Whereas Cyrus had been careful to have himself installed as legitimate King of Babylon, in so far as legitimacy could be conferred by a strict observance of the traditional ceremonies of investiture (see Meyer, op. cit., vol. iii, p. 129), Xerxes followed Sennacherib's example in deliberately refraining from 'taking the hands of Bel' on New Year's Day, 484 B.C. The revolt of Babylonia in the autumn of the same year was the last act of Babylonian recalcitrance with which the Achaemenian Government had to contend, for it was suppressed with such severity that, for the next hundred and fifty years, Babylonia lay sullenly passive under the Achaemenian yoke, until Alexander entered Babylon as a liberator and raised the temple of Bel from its ruins (Meyer, op. cit., pp. 129-32; cf. the present chapter of the present Study, p. 94, above, as well as V. C (i) (c) 4, pp. 347-8, and V. C (ii) (a), Annex II, vol. vi, p. 442, below). The overthrow of the Achaemenian Empire by Macedonian arms brought with it a reversal of fortune for Phoenicia as well as for Babylonia. Before Alexander had been welcomed as a liberator by Babylon he had taken Tyre by storm and had put her to the sack in reprisal for her obstinate loyalty to the lost cause of the last Darius. Thereafter, under a Seleucid régime which continued to treat Babylonia with Alexander's considerateness (see Tarn, W. W.: *The Greeks in Bactria and India* (Cambridge 1938, University Press), pp. 56-7), the Phoenicians suffered further reverses. For example, in 259 B.C., when the Aradian monarchy was replaced by republican institutions in the imperial city itself, the Aradian empire on the mainland was simultaneously broken up into city-state republics each depending directly upon the Seleucid Government. When the Seleucid Empire itself broke up at the turn of the second and the last century B.C., Aradus recovered her dominion over Marathus and some other fragments of her former continental empire (Jones, op. cit., pp. 239-40), but in 38 B.C. these possessions were taken away from her again, and this time once for all, by Marcus Antonius (Jones, op. cit., pp. 261-2). These blows were not offset by the spread of Phoenician, at the heels of Greek, traders eastward, overland, into 'Upper Asia' (see Tarn, op. cit., p. 10).

The transformation of the Achaemenian Empire from a semi-Babylonian into a wholly

In a world in which the turn of Fortune's wheel had thus put down the Babylonians from their seat and had exalted Zoroaster's Achaemenian converts and the Jews' Phoenician cousins, the triumph of Judaism¹ and Zoroastrianism might have been expected to be more certain and more rapid than it would have been if Belshazzar's Kingdom had not been given to the Medes and Persians.² But Fortune intervened again to give another unexpected

Syriac universal state can be followed in the history of the Achaemenian Government's official scripts and languages. For inscriptions on stone the Babylonian cuneiform script was employed, and every inscription was trilingual—the three languages in which it was inscribed being those of the three official capitals: Elamite for Susa, Medo-Persian for Ecbatana, and Assyro-Babylonian for Babylon (Meyer, *op. cit.*, p. 28). For the conveyance of the Medo-Persian language a special simplified version of the cuneiform script was devised. Under the later Achaemenids, however, there was a noticeable increase in the faultiness of the rendering of the cuneiform script, and this suggests that it had come by then to be an anachronism which was being perpetuated officially after it had been abandoned in ordinary life (Meyer, *op. cit.*, p. 48). *Pari passu* with this decay of the cuneiform script there was an increase in the vogue of the Aramaic script and language. Under the Achaemenian régime Aramaic was the official provincial language for all the western provinces of the Empire—including Egypt and Anatolia, where it was not indigenous as a vernacular (Meyer, *op. cit.*, pp. 47–8, and *idem*: *Der Papyrusfund von Elephantine* (Leipzig 1912, Hinrichs), p. 17; the present Study, V. C (i) (d) 6 (γ), p. 499, below). The Persian language itself was already being written in Aramaic characters on papyrus before the end of the Achaemenian Age (Meyer, *Papyrusfund*, p. 17).

¹ Eduard Meyer has gone so far as to declare that 'Judaism is a creation of the Persian Empire' (*Der Papyrusfund von Elephantine*, p. 96).

² The propagation of these would-be universal religions among the population of the Achaemenian Empire must also have been facilitated by the fact that—mild and even benevolent though the Achaemenian *ethos* was by contrast with the Assyrian (Meyer, *op. cit.*, pp. 44–5)—the Assyrian practice of uprooting and transplanting was not altogether abandoned under the Achaemenian régime. For example, the Great King colonized the formidably torrid islands in the Persian Gulf by planting them with deportees who were officially known as *les déracinés* (*οἱ ἀνασarroῖ*); and these appear to have been Iranians, to judge by the type of equipment and armament that is ascribed to them in the catalogue of Xerxes' expeditionary force (compare Herodotus, Book III, chap. 93, with Book VII, chap. 80). Apart from these presumably disloyal members of the dominant minority in the Achaemenian Empire, the principal victims of the deportation-policy appear to have been the recalcitrant members of the Greek subject population. Darius the Great's general Otanes 'netted' the island of Samos and swept it bare of all inhabitants (Herodotus, Book III, chap. 140); and other commanders of the same emperor's forces carried away captive to Susa the people of the Greek city of Barca in Libya (Herodotus, Book IV, chap. 204), of the Greek city of Miletus in Ionia (Herodotus, Book VI, chap. 20), and of the Greek city of Eretria in Euboea (Herodotus, Book VI, chap. 119). These four cases of severity were perhaps exceptional; for we are expressly informed by the Greek historian—who would not go out of his way to present the Achaemenian régime in an unduly favourable light—that Otanes was acting, under provocation, in contravention of Darius's orders that the Samians were neither to be massacred nor to be enslaved (Herodotus, Book III, chap. 147), while, as for the deported Eretrians, Darius is recorded to have taken pity on them when he had them in his power and to have settled them comfortably on an estate of his own in Elam (Herodotus, Book VI, chap. 119). The Milesian deportees were settled at the mouth of the River Tigris (Book VI, chap. 20), and the Barcaeans in Bactria (Book IV, chap. 204).

These indications suggest that the favourable picture of the Achaemenidae which has been painted for us in the Jewish tradition is on the whole true to life. The Greeks themselves are, as we have noticed already (in V. C (i) (c) 1, pp. 50–2, above), the most impressive of the witnesses in the Persians' favour. It is noteworthy, however, that—to judge by a passing remark of Plato's—the Greeks appear to have assumed that, if they had succumbed to Xerxes, it would have been their fate to have been swallowed up in the Syriac internal proletariat:

'If the common determination of the Athenians and the Lacedaemonians had not rescued Hellas from the doom of servitude which was impending over her, by this time the various Hellenic races would have become almost completely confounded with one another—and likewise the non-Hellenic with the Hellenes, and *vice versa*—to judge by the appalling present condition of the populations under the Persian yoke, which

turn to the course of events. She now delivered the Kingdom of the Medes and Persians into the hands of a Macedonian conqueror; a violent intrusion of the Hellenic Society upon the Syriac World broke the Syriac universal state in pieces long before its role was played out; and therewith the two 'higher religions' which had been converting men's souls under the Achaemenian aegis¹ were driven into the disastrous aberration of exchanging their proper religious function for a political role.² Each on its own ground, they became champions of the Syriac Civilization in its secular struggle against the Hellenism that had intruded have been quite disintegrated by being interlarded and kneaded up together' (Plato: *Leges*: 692B-693A).

¹ We have little information about the spread of Judaism and Zoroastrianism among the population of the Achaemenian Empire before the Achaemenian régime was overthrown by Alexander; but by inference from the rather less fragmentary evidence relating to the subsequent age of the Hellenic ascendancy we can gather that Zoroastrianism found a welcome in Anatolia (particularly in Cappadocia: see Meyer, E.: *Geschichte des Altertums*, vol. iii (Stuttgart 1901, Cotta), pp. 128-9) and Judaism in the region that had once been Assyria (particularly in Adiabene). The uprooted Babylonians who were transplanted by the Assyrian war-lord Sargon to the territory which had once been the Kingdom of Israel became converted to a bastard form of the religion of Israel. The picturesque story in the Second Book of Kings (chap. xvii, vv. 24-41) is manifestly tinged with legend and tainted with the Jews' notorious anti-Samaritan prejudice; yet its account of the genesis of the Samaritan religion as a syncretism between the worship which the deportees found in their new home and the worship which they brought with them from their old homes is borne out by the evidence of Aramaic papyri, dating from the sixth and fifth centuries B.C., which have been discovered at Eléphantine by our modern Western archaeologists and which relate to the affairs—including the religious life—of a Jewish military colony in this frontier-fortress of the Achaemenian Empire; for the Judaism of this colony had in it a strong tincture of Babylonian polytheism; and this tincture is most easily accounted for on the hypothesis that the colony was of mixed Jewish and Samaritan origin (see van Hoonacker, A.: *Une Communauté Juéo-Araméenne à Eléphantine, en Égypte, aux vi^e et v^e siècles av. J.-C.* (London 1915, Milford), especially pp. 73-85). The Biblical story may thus be taken to be true in essence—and true not only of the Samaritans themselves but of hundreds of other communities of exiles whose history has not been preserved even in the literature of their enemies. As time went on, the new Israelitish elements in the religion of the Babylonian settlers in Samaria must have gained the upper hand over the ancestral worship which the settlers had brought in with them; for the Samaritan religion, as we know it to-day, has the appearance of being a rudimentary or a degenerate form of Judaism, with no conspicuous traces of Babylonian accretions. (A possible explanation of this victory of an indigenous over an imported religion in Samaria has been suggested on p. 118, footnote 3, above.) After the reorganization, on an ecclesiastical basis, of the repatriated Jewish community at Jerusalem, the *ci-devant* Babylonian community at Samaria seem to have adopted the Torah from their little-loved neighbours in Palestine under the direction of some renegade Hierosolymitan priests (see Meyer, E.: *Geschichte des Altertums*, vol. iii (Stuttgart 1901, Cotta), p. 214; according to the same scholar, *Der Papyrusfund von Elephantine* (Leipzig 1912, Hinrichs), pp. 80-1, the Samaritans accepted Ezra's reform in all particulars save the centring of the worship of Yahweh upon Jerusalem, for which the Samaritans substituted their own Mount Gerizim). If this has been the history of the Samaritan religion, it gives us a glimpse, in one local instance, of the general process of assimilation through which the whole of the Babylonian body social, with the single exception of the outlying city-state of Harran, was absorbed into the Syriac body social before the beginning of the Christian Era. The strange survival of the Babylonian culture in Harran down to the age of the 'Abbasid Caliphate has been mentioned in another context already (in IV, C (ii) (b) 2, vol. iv, p. 101, footnote 1, above). The cause of this survival seems to have been the tenacity of the Babylonian outpost at Harran in clinging to an ancestral worship—a tenacity which contrasts very sharply with the pliancy of the Babylonian exiles at Samaria in capitulating to the god whom they found in the land to which they had been transplanted.

² For a general discussion of the relations between 'higher religions' and political potentates see V. C (i) (d) 6 (δ), Annex, below.

upon the Syriac domain.¹ Judaism, in its advanced position west of the Euphrates, was inevitably cast for the part of 'forlorn hope', and it duly broke itself against the overwhelmingly greater material power of Rome in the Romano-Jewish wars of A.D. 66-70 and 115-17 and 132-5.² Zoroastrianism, in its fastness east of Zagros, took up the struggle in the third century of the Christian Era under less desperately unequal conditions. In the Sasanian Monarchy Zoroastrianism found a more potent weapon for an anti-Hellenic 'crusade' than Judaism had been able to forge out of the petty principality of the Maccabees; and the Sasanidae gradually wore down the strength of the Roman Empire in a four-hundred-years-long struggle which culminated in the two great Romano-Persian wars of A.D. 572-91 and A.D. 603-28. This strategy of attrition, however, was even more destructive to the Zoroastrian Church Militant than it was to the Hellenic adversary; and in the end Zoroastrianism had to pay as heavily as Jewry for having lent itself to a political enterprise.³ At the present day the Parsees, like the Jews, survive as a *mère* 'Diasporà'; and the petrified religion which still so potently holds the scattered members of either community together has lost its message for Mankind and has hardened into a 'fossil'⁴ of the extinct Syriac Society in the particular phase of disintegration in which that society happened to find itself at the moment when it was smitten by the impact of Hellenism in the fourth century B.C.⁵

This impact of an alien cultural force did not merely divert the 'higher religions' of the Syriac internal proletariat into political paths: it also split them into fragments, as the stones of a cathedral are splintered by the explosion of a shell, or as a beam of light is diffracted when it is intercepted by a prism. After the transformation of Judaism and Zoroastrianism into instruments of Syriac

¹ See I. C (i) (b), vol. i, pp. 90-1; II. D (v), vol. ii, p. 203; II. D (vi), vol. ii, pp. 234-6; II. D (vii), vol. ii, pp. 285-6 and 374; IV. C (iii) (b) 12, vol. iv, p. 225, and IV. C (iii) (c) 2 (α), vol. iv, pp. 262-3, above, as well as V. C (i) (d) 6 (δ), Annex, pp. 657-61, and V. C (i) (d) 9 (γ), vol. vi, pp. 120-3, below.

² See the present chapter, p. 68, above.

³ There was, of course, a native vein of militancy in a religion which conceived of the Universe as a battlefield in a cosmic war between opposing forces of Light and Darkness; but in the Achaemenian Age the Achaemenian emperors refrained from using their political power for the forcible propagation of a religion to which the Imperial House itself had become converted. (For this Achaemenian tolerance see further V. C (i) (d) 6 (δ), Annex, pp. 704-5, below.)

⁴ For these and other 'fossils' of extinct civilizations see I. B (iii), vol. i, p. 35; I. C (i) (b), vol. i, pp. 90-2; II. D (vi), vol. ii, pp. 234-9, above.

⁵ This unfortunate change in the *ethos* of both Judaism and Zoroastrianism is revealed in the pathological exaggeration, in both religions in their petrified state, of the elements of ritual and legal observance (for the Jewish case, see IV. C (iii) (c) 2 (α), vol. iv, pp. 262-3, and IV. C (iii) (c) 2 (γ), Annex, vol. iv, p. 638, above). The change might be described with equal truth in another way by saying that, in their petrified state, Judaism and Zoroastrianism had each partially relapsed from the level of the 'higher religions' towards the lower level of the primitive tribal religions from which both these faiths had originally sprung.

political opposition to a Hellenic dominant minority, the Syriac religious genius took refuge among those elements in the Syriac population under Hellenic ascendancy which were reacting to the challenge in the gentle and not in the violent way; and, in giving birth to Christianity and Mithraism as its contributions to the spiritual travail of a Hellenic internal proletariat,¹ Syriac religion found new expressions for a spirit and an outlook which Judaism and Zoroastrianism had repudiated.² In the next chapter after that, we see the still half-submerged Syriac Society seeking to recapture, for its own benefit, some of the virtue that had gone out of Syriac into Hellenic souls in the preaching of Christianity to the Gentiles. Nestorianism and Monophysitism were alternative attempts to purge a Syro-Hellenic religious syncretism of its Hellenic alloy;³ and the Nestorian and Monophysite 'Diasporas' survive to-day as 'fossils' of an extinct Syriac Society as it was when it was making this second abortive attempt to cast the spirit of Hellenism out.⁴

Two successive failures, however, did not reduce the Syriac opponents of Hellenism to the apathy of despair; a third attempt followed, which was crowned with success; and this final political

¹ 'A dying Roman Society was fascinated by the worships of Isis, Serapis, Horus, and Mithras: worships which, once upon a time, a then just dawning soul in the East had conceived as the first dreamy, anxious expression of its existence and had filled with a new inner meaning.'—Spengler, O.: *Der Untergang des Abendlandes*, vol. I (Munich 1920, Beck), p. 155.

² In Mithraism, as in Zoroastrianism (see p. 126, footnote 3, above), there was, of course, a vein of militancy, and this no doubt accounts for the appeal which Mithraism (like Zen Buddhism) is known to have made to soldiers. The historic achievement of Mithraism was not, however, to inspire Iranian knights (as these were inspired by Zoroastrianism in the Sasanian Age) to bear arms in anti-Hellenic crusades. The soldier-converts of the Mithraic Church Militant were Roman legionaries whose professional duty was to hold the Iranian adversaries of Hellenism at bay. Thus, while Zoroastrianism failed to eject by force of arms the Hellenic intruders upon the former domain of the Achaemenian Empire, Mithraism succeeded in captivating Hellenism for an Iranian religion by making a spiritual conquest of Roman soldiers' hearts. On this showing, the spread of Mithraism in the Roman Army, no less than the spread of Christianity among the civilian population of the Roman Empire, is to be interpreted as a triumph of what Mr. Gandhi would call 'soul force'.

³ See II. D (vii), vol. II, pp. 286-7, and IV. C (iii) (c) 2 (β), vol. IV, pp. 325-6, above. On the surface the Nestorian and Monophysite heresies were, like Catholic Orthodoxy, part of a dialectical endeavour to express Christian theological tenets in terms of Greek philosophy; and, in the minds of the heresiarchs themselves, this was, no doubt, the very essence of their life-work, and not just a superficial and deceptive aspect of it. They can neither have intended nor foreseen the subsequent conversion of their own abstruse theologico-philosophical propositions into the popular slogans of an Oriental revolt against the ascendancy of Hellenism. The abiding potency of this ascendancy in the fifth century of the Christian Era, some eight hundred years after the date of its first establishment by the arms of Alexander, is attested by the facts that, even as late as this, the Oriental reaction against Hellenism had still to confine itself, west of the Euphrates, to a cultural field of conflict, and that, even on this ground, it found itself constrained to pay homage to the Hellenism which it was combating by fighting its intellectual battle with weapons of Hellenic make. It is no wonder that these weapons proved unavailing for the incongruous purpose which, *faute de mieux*, their Oriental wielders were attempting to make them serve.

⁴ For the possible role of Manichaeism in this chapter of Syriac history see V. C (i) (c) 2, Annex I, on pp. 575-80, below.

triumph of the Syriac Society over Hellenism was achieved through the instrumentality of yet another religion of Syriac origin. Islam had originally been preached to the Arabian external proletariat of the Roman Empire by a prophet whose soul had been stirred by the Syriac religious influences of Judaism and Nestorianism and Monophysitism.¹ The barbarian prophet's energies had then been diverted from a painfully abortive religious mission to a triumphantly successful political career;² and the political unity which Muhammad and his caliphs or temporal successors succeeded in imposing upon the Arabs enabled these barbarians to conquer the Oriental provinces of the Roman Empire with one hand and the whole of the Sasanian Empire with the other, and thereby to complete the undoing of the political work of Alexander the Great by reuniting the Syriac World and re-establishing the Syriac universal state which had been first established by the Achaemenidae.³ Within the framework of the Arab Caliphate, Islam won the prize of which Judaism and Zoroastrianism had been cheated, when it was almost within their grasp, by the distracting military intervention of Alexander. Before the Arab Caliphate broke up, Islam had become the universal church of the Syriac internal proletariat.⁴

This victory of Islam in the Syriac World resembled the victory of Christianity in the Hellenic World in being vigorously contested and hardly won; but the adversaries were not quite the same and the battle was fought with different weapons. Whereas Christianity found its most formidable opponent in the Roman Imperial Government, the Arab Caliphate was Islam's creature, friend, and ally.⁵ On the other hand the rival religious move-

¹ See III. C (ii) (b), vol. iii, pp. 276-8, with Annex II, above. It will be seen that there is a close parallelism between the genesis of Islam and the genesis of Zoroastrianism. Both religions came to birth in a barbarian environment; and the barbarian prophets who conceived them were probably both acting under Syriac religious influences (if we are right in our conjecture that Zarathustra may have been influenced by a contact with the Israelite deportees in Iran, as Muhammad was undoubtedly influenced by his contact with the Jewish and Christian 'Diasporas' in Arabia).

² See III. C (ii) (b), Annex II, in vol. iii, above.

³ For this 're-integration' or 'resumption' of the Syriac universal state by the Umayyads and 'Abbasids see I. C (i) (b), vol. i, pp. 72-7, above.

⁴ Islam succeeded where Zoroastrianism and Judaism had failed, in spite of the fact that Islam had fallen, in its turn, into the Zoroastrian and Jewish churches' error of 'going into politics'. The date of the Hijrah, which marks the moment when Muhammad abandoned Gentleness for Violence and exchanged the prophet's for the statesman's career, has been rightly taken by later generations of Muslims as the initial date for the Islamic Era, on the ground that the Hijrah made, instead of marring, Islam's fortune. For a possible explanation of this apparent paradox see V. C (i) (d) 6 (8), Annex, pp. 673-8, below.

⁵ The Caliphate was the friend of Islam under the Umayyad régime and its ally under the 'Abbasid régime which replaced the Umayyad régime in A.D. 750. The Umayyads, of course, as well as the 'Abbasids, were officially Muslims; but the Umayyads' Islam was perfunctory (the fervour of 'Umar II (*imperator* A.D. 717-20) being the exception that proves the rule), and they never dreamed of forcing Islam upon the non-Muslim 'People of the Book' who constituted an overwhelming majority

ments with which the Sunnah had to contend resorted to a physical violence which was not employed by the rivals of Christianity, any more than it was by Christianity itself, in the competition between 'higher religions' in the Roman Empire.

When we peer into the depths of the Syriac underworld in the age of the Sasanian Empire and in the succeeding age of the Arab Caliphate, we behold a spectacle which recalls the dreadful picture of the Hellenic underworld in the last two centuries B.C. The seething cauldron is never quiet, and it boils over periodically in a militant revolt that is apt to be religious in form but economic or political in substance. The Communist prophet Mazdak who set himself to captivate or capture the Sasanian body politic in the fifth century of the Christian Era¹ reminds us of Aristonicus of Pergamum preaching his 'City of the Sun'. The Sicilian slave-wars of 135-131 and 104-100 B.C. have an almost exact analogue in the 'Irāqī slave-war of A.D. 869-83, in which the African Negro slave-gangs on the plantations in the neighbourhood of Basrah defied the 'Abbasid Power as the Roman Power was defied by the Syrian slave-gangs on the plantations round Enna.² And in the outbreaks of the Khārijīs and Carmathians and Ismā'īlīs (or 'Assassins') we seem to see the Zealots and Sicarii of the militant age of Jewish history being recalled to life. The story of a social

of their subjects. In this matter their policy was that of the Achaemenidae, who were Zoroastrians themselves yet never used their political power as an instrument of Zoroastrian religious propaganda. On the other hand the policy of the 'Abbasids towards Islam was rather more like that of the Sasanidae towards Zoroastrianism; for, though the charter which was conferred upon 'the People of the Book' by the Islamic *Shari'ah* inhibited the 'Abbasids from going to the Sasanian length of imposing their own dynastic religion upon their subjects by main force, the 'Abbasids did follow the example of the Sasanidae in making their state into an instrument of their religion and their religion into a pillar of their state. For a further examination of the respective policies of these four dynasties towards the religions to which they severally paid their private allegiance, see V. C (i) (d) 6 (δ), Annex, pp. 704-5 (for the Achaemenidae), pp. 659-61 (for the Sasanidae), pp. 675-7 and 704 (for the Umayyads), pp. 678 and 706 (for the 'Abbasids).

¹ See Christensen, A.: *Le Règne du Roi Kawadh I et le Communisme Mazdakite* (Copenhagen 1925, Lunos), and eundem: *L'Iran sous les Sassanides* (Copenhagen 1936, Levin & Munksgaard), chap. 7.

² For an account of this revolt of African Negro slaves in 'Irāq in the ninth century of the Christian Era see Nöldeke, Th.: 'A Servile War in the East' in *Sketches from Eastern History*, English translation (London and Edinburgh 1892, Black). The Zanij, as these Negroes were called, were employed by *entrepreneurs* on the heavy work of digging away the nitrous top-layer of the soil on the flats east of Basrah and laying bare, for cultivation, the fertile layer of soil that was to be found below. There were no personal relations between these slaves and their masters; and the slaves were both ill used and exasperated. When they rose, they were joined by the free rural, but not by the free urban, proletariat. Like the Syrian slave-insurgents in Sicily, these African slave-insurgents in 'Irāq had the constructive idea of establishing a state, and their leader 'Alī b. Muhammad (who was either a North Persian from Verzenin near Tīhrān, or else an 'Abd-al-Qaysi Arab from Bahrayn) founded a city, on the Shatt-al-'Arab below Basrah, which he named Mukhtārah. At different moments in the course of their operations the rebels captured Obolla, 'Abbādān, Ahwāz, Basrah, and Wāsit, and, even when the Baghdad Government managed to concentrate its forces against them, they held out stubbornly in their swamp-fastnesses. The war, which began in A.D. 869, was only brought to an end in A.D. 883 by the capture of Mukhtārah itself.

convulsion which begins as a religious or even as a philosophical movement and ends in a political *emeute* recurs again and again; and the fleeting, futile figures of a Theudas and a Judas of Galilee, as they are conjured up before our mind's eye by Gamaliel's contemptuous phrases,¹ are matched in the 'Abbasid Age by the figures of al-Muqanna', 'the Veiled Prophet' of Khurāsān, and Bābak al-Khurrāmī.² Indeed, in the history of the Syriac underworld from the time of the suppression of Mazdak by the Sasanian King Kawādh (Qubādh) I *circa* A.D. 528-9 down to the time of the smoking out of the Assassins' eyrie on Alamūt by the Mongol warlord Hulāgū *circa* A.D. 1255, the prophets of violence are legion; but the rest of their acts, and the evil that they did, are they not written in *The Book of Religious and Philosophical Sects* by the hand of the omniscient Shahrastānī?³

From the first generation of Islam onwards the sufferings and resentments of the disinherited and outcast masses of the Syriac internal proletariat were projected upon the figures of a martyred 'Alī and his martyred sons, whose spiritual stature increased as they passed out of history into legend; and from that time onwards a majority of the upheavals were manifestations in diverse forms of a single Protean Shī'ah.⁴ The author of the Zanj revolt declared himself to be of 'Alid lineage;⁵ and the violent expression of Shī'ism reached its acme in the fighting fraternity of the Carmathians and the murdering fraternity of the Assassins. It is interesting to observe that in the Shī'ah, as in Jewry, the shattering defeat of the militant movements—at the hands of powers which were overwhelmingly stronger than the insurgent proletarians in the physical force in which the insurgents had put their trust—was followed by a revulsion from Violence towards Gentleness. The trade-guild brotherhoods in which the Shī'ah embodied itself from the twelfth

⁴ For the history of the Shī'ah from the beginning down to the generation of Shāh Ismā'il see I. C (i) (b), Annex I, vol. i, pp. 353-66 and 400-2, above.

⁵ Compare the 'Alid pretensions of the Idrīsī and the Fātimī dynasties of Ifriqiyyah. To claim 'Alid descent was equivalent to claiming a hereditary spiritual grace or even divinity; and the establishment of this religious pretension was of immense political value, since the credulous might be induced to risk their lives in following a prophet in a 'forlorn hope' which they would have regarded as quite desperate if it had been presented to them as a nakedly political enterprise. The Prophet Muhammad himself owed his political success in large measure to the confidence which his prophetic pretensions inspired in his followers' hearts as well as in his own self; and the Apamean slave Eunus, who instigated and led the slave-revolt at Enna which precipitated the first of the Sicilian slave-wars, prepared the ground by attempting to create a reputation for himself as a psychic 'medium' (see V. C (i) (d) 7, vol. vi, p. 34, footnote 5, and V. C (ii) (a), Annex II, vol. vi, p. 383, below).

to the fifteenth century of the Christian Era bore as little resemblance to the Carmathian war-bands or to the Ismā'īlī *camorra* as was borne by the latter-day Jewish rabbinical schools to the Jewish Church Militant of a Judas Maccabaeus or a Simon bar Kōkabā.¹

The Indic and the Sinic Internal Proletariat.

The disintegrating Syriac Society's experience of having its course interrupted by a brusque and violent intrusion of Hellenism befell the Indic Society likewise;² and it is interesting to examine how far, in this case, an identic challenge evoked a similar response.

At the time when the Indic and Hellenic societies made their first preliminary contact—as a result of Alexander's successful destruction of the Achaemenian Empire and his abortive raid into the Indus Valley—the Indic Society was already so far advanced along the road of disintegration that it was on the point of entering upon its universal state,³ and the Indic dominant minority had long since reacted to the ordeal by creating the two philosophical schools of Jainism and Buddhism.⁴ There is no evidence, however, that the Indic internal proletariat had yet discovered any 'higher religions' corresponding to the Zoroastrianism and the Judaism which were in the act of converting the Syriac World at the moment of Alexander's advent.

The first of the transactions that took place between the Indic philosophers and the remarkable alien society which had suddenly loomed up above their western horizon was an attempt, on the Indic philosophers' part, to convert their new neighbours to their own way of life. The Buddhist philosopher-king Aśoka, who occupied the throne of the Indic universal state from 273 to 232 B.C., has bequeathed to us, among his inscriptions, a record of the philosophic missions which he sent, *circa* 259 B.C., to the realms of five of the Epigoni; and a hundred years later, after the first Indic universal state had broken up and the intrusion of Hellenism upon the Indic World had begun—nearly a century and a half after the crossing of the Dardanelles by Alexander of Macedon—with the crossing of the Hindu Kush by Demetrius of Bactria *post* 190 B.C.,⁵ the 'gymnosophists' were given an opportunity of

¹ For this metamorphosis of the Shi'ah see the note by Professor H. A. R. Gibb in I. C (i) (b), Annex I, vol. i, pp. 400–2, above. See further Gibb, H. A. R., and Bowen, H.: *Islamic Society and the West*, vol. i, chap. xiv: 'The Dervishes', for the transition from a 'Thisworldly' violence to an 'Otherworldly' non-violence that accompanied the replacement of the Bātinīs by the Sūfīs.

² See I. C (i) (b), vol. i, pp. 84–8, above.

³ Alexander's raid on the fringes of the Indic World took place in 327–325 B.C.; Chandragupta established the Indic universal state in 323–322 B.C.

⁴ See V. C (i) (c) 1, p. 58, above.

⁵ On this question of date see I. C (i) (b), vol. i, p. 86, above. Tarn, W. W.: *The Greeks in Bactria and India* (Cambridge 1938, University Press), p. 133, dates Demetrius's crossing of the Hindu Kush *circa* 183–182 B.C.

preaching to a Hellenic war-lord on their own ground, in the heart of the Indic World itself, when the flood tide of the Hellenic military invasion left Demetrius's lieutenant and successor Menander high and dry between Indus and Ganges.

This Indic philosophical propaganda had a promising field in the Hellenic Society of the age; for the Hellenic, like the Indic, Civilization was in disintegration; and Buddhism offered—for any dominant minority that was sick in soul and was conscious of its sickness—a spiritual remedy which was more radical and more courageous than the existing native Hellenic philosophical systems of Platonism and Cynicism and Epicureanism and Stoicism. A disciple of any of these Hellenic schools would have found himself at home in the spiritual climate of Buddhism;¹ and, while he would have felt himself to be in the presence of a spirit which was a match for his own in its intellectual power of penetrating to the heart of things, he would have recognized that the Indic was superior to the Hellenic philosophy in its moral power of acting up to its formidable convictions.² Of the five Hellenic princes to whose countries Acoka dispatched his philosophic missionaries, at least one—Antigonus Gonatas—was an admirer of Zeno³ who might have been fired with a deeper admiration for the still more austere and masterly genius of Siddhārtha Gautama. The results of Aṣoka's mission to the Hellenes are, however, unknown, and this negative evidence suggests that they cannot have been very striking, while it would be rash to infer that Buddhism made a serious impression upon Menander⁴ from the fact that this Hellenic intruder's name has been taken in vain by a Buddhist man-of-letters as a label for one of the characters in an imaginary philosophical dialogue.⁵ We can only say that, as a philosophy, Buddhism had and saw, but missed, a chance of captivating the Hellenic dominant minority and driving the native schools of Hellenic philosophy off the field before the lists were entered by any proletarian-born religion. This, of course, was not the end of the story; for, in spite of having lost this golden opportunity, Buddhism did eventually take by storm the outlying, yet extensive and important, province of the post-Alexandrine Hellenic World which was occupied by the Greek

¹ For evidence of this see V. C (i) (d) 10, *passim*, vol. vi, pp. 132-48, and the passage quoted from Mr. Edwyn Bevan in V. C (i) (d) 11, vol. vi, pp. 151-52, below.

² See further V. C (i) (d) 10, vol. vi, p. 140, below.

³ See V. C (ii) (a), vol. vi, p. 249, below.

⁴ In the opinion of W. W. Tarn: *The Greeks in Bactria and India* (Cambridge 1938, University Press), p. 269, it would be 'quite unsafe to call' Menander 'a Buddhist even in the limited sense in which Antigonus Gonatas, the nearest analogy, is sometimes called a Stoic'.

⁵ The *Milindapañha* or *Questions of Menander*. Tarn (in op. cit., Excursus, pp. 414-36) brings forward reasons for supposing that this Pāli work may have been at least partly inspired by a Greek original.

Kingdom of Bactria and its Eurasian Nomad 'successor-states', and which embraced a conquered Indic territory in the Basin of the Indus and Ganges as well as a conquered Syriac territory in the Basin of the Oxus and Jaxartes.¹ But Buddhism did not make this triumphant spiritual counter-conquest until it had undergone an extraordinary metamorphosis² through which the old philosophy of Siddhārtha Gautama became transformed into the new religion of the Mahāyāna.³

'The Mahāyāna is a truly new religion, so radically different from Early Buddhism that it exhibits as many points of contact with later Brahmanical religions as with its own predecessor. . . . It never has been fully realized what a radical revolution had transformed the

¹ For the political unification of these Indic and Syriac territories under the Hellenic rule of Bactrian Greek war-lords see II. D (vii), vol. ii, pp. 371-2, above. This unification under the rule of the Euthydemid Greek dynasty was short lived; for the conqueror Demetrius does not seem to have crossed the Hindu Kush before 183 B.C. or to have occupied the fallen Mauryan Empire's capital at Pataliputra before about 175 B.C., and the fatal division of the Greek Power in the Far East, through the invasion of the Euthydemid Empire by the Seleucid legitimist claimant Eucratides, seems to have occurred not later than 168 B.C. (Tarn, W. W.: *The Greeks in Bactria and India* (Cambridge 1938, University Press), pp. 132-3). The still vast but no longer united Greek dominions east of Khurāsān were then soon overrun by Nomad invaders from the Eurasian Steppe (see V. C (i) (c) 3, pp. 239-40, with Annex II, below). In or shortly before 130 B.C. the Yuechi occupied the Upper Oxus and Jaxartes Basin (Sogdiana and Bactria) up to the line of the Hindu Kush; and, when the Sakas and Parsians who invaded Parthia in 129 B.C. were beaten by the Suren between 124 and 115 B.C., the Parsians compensated themselves by ousting the Greeks, some time before 87 B.C., from Cōphēnē (round the head-waters of the Hilmand and Kābul rivers) and the Sakas by ousting them from Patalēnē (the Indus Delta), Surāshtra (Kathiāwār and Gujerāt), Taxila (the Western Panjab), Gandhāra (the Lower Kābul Valley), and the Paropamisadae (the Upper Kābul Valley) between circa 110 and circa 60 B.C. Thereafter the last Greek principalities in the Kābul Valley and in the Eastern Panjab were extinguished by the Persian masters of Cōphēnē circa 30 B.C., and then in A.D. 19 this Persian Empire, together with the remnants of the Saka Empire in Sind and Surāshtra, was conquered by the Parthian Suren Gondophares. It was, however, not the eastern wing of the Parthians but one of the five war-bands of the Yuechi that achieved a lasting reunification of the dominions which Demetrius the son of Euthydemus had held together between 175 and 168 B.C. The Kushans united all the five Yuechi principalities in Bactria and Sogdiana under their own sovereignty and at the same time made conquests in the Indic World which were almost, if not quite, as wide as those of Demetrius himself; and they presented themselves to their subjects as the extinct Greek princes' legitimate heirs. As early as about 50 B.C. the Kushan chief Miaoos seems to have lent the Greek prince Hermaeus, in the Paropamisadae, military assistance against the Parsians of Cōphēnē, and to have been given a Greek princess in marriage as part of his reward (Tarn, op. cit., pp. 342-3); and it was Miaoos' descendant Kadphises I (*reigned* post A.D. 25-A.D. 50) who united the Yuechi under Kushan rule and began the Kushan conquest of India (*ibid.*, p. 338). There is numismatic evidence (examined *ibid.*, pp. 503-7) which seems to show that Kadphises I Kushan made the most of his descent from Hermaeus's family in order to win the sympathies of the Greek and Philhellene elements in the population of the Paropamisadae when he was contending with a Parthian antagonist for the possession of this Indic country. The Sakas, as well as the Kushans, were successors of the Greeks in India in the sense that they took over, unchanged, their Greek predecessors' institutions: e.g. their administrative system, their coinage, and their calendar (*ibid.* pp. 241-3, 300, 323, 358-9). 'The Sakas simply stepped into the shoes of the Greeks; Indian writers regularly classed them with the Yavanas, and regarded them, as they regarded the Yavanas, as imperfect Kshatriyas' (p. 323).

² A clear account of this, in small compass, will be found in Eliot, Sir Ch.: *Japanese Buddhism* (London 1935, Arnold), pp. 74-87.

³ Seven distinctive notes of the Mahāyāna are set out in Eliot, Sir Ch.: *Hinduism and Buddhism* (London 1921, Arnold, 3 vols.), vol. ii, p. 6.

Buddhist Church when the new spirit—which, however, was for a long time lurking in it—arrived at full eclosion in the first centuries A.D. When we see an atheistic, soul-denying philosophic teaching of a path to personal final deliverance, consisting in an absolute extinction of life¹ and a simple worship of the memory of its human founder—when we see it superseded by a magnificent High Church with a Supreme God, surrounded by a numerous pantheon and a host of saints: a religion highly devotional,² highly ceremonious and clerical, with an ideal of universal salvation of all living creatures, a salvation by the divine grace of Buddhas and Bodhisattvas, a salvation not in annihilation but in eternal life—we are fully justified in maintaining that the history of religions has scarcely witnessed such a break between new and old within the pale of what nevertheless continues to claim common descent from the same religious founder.³

The transformed Buddhism which, in the shape of the Mahāyāna, was now invading the far eastern extremity of a vastly expanded Hellenic World was, in fact, an Indic 'higher religion' of the same type as the Syriac and Egyptiac and Hittite 'higher religions'—Christianity and Mithraism and the worships of Isis and Cybele—that were invading the heart of the Hellenic World in the same age. Like these other alien competitors for the conversion of Hellenic souls, the Mahāyāna made itself doubly attractive to its public by combining a comfortable conformity to the externals of the Hellenic culture with the offer of an inward spiritual treasure which was the great thing lacking in the native Hellenic heritage and which was therefore desirable in Hellenic eyes just in virtue of being exotic.⁴ On the one hand the Mahāyāna seized upon the mediocre version of Hellenic art which was current in the outlying Kingdom of Bactria and its barbarian 'successor-states', and drew from this unpromising source⁵ the inspiration for one of the most sublime and creative schools of art that have yet been produced by the co-operation of the religious with the aesthetic faculty of the Human Spirit.⁶ On the other hand the Mahāyāna offered to a

¹ A more precise account of the Primitive Buddhist conception of *Nirvāṇa*, from the same pen, will be found in V. C (i) (d) 10, vol. vi, pp. 142-3, below. The view that Siddhārtha Gautama conceived of *Nirvāṇa* as a negation of existence, and that he also denied the existence of God and of the Self, is challenged by Sir S. Radhakrishnan in *Gautama the Buddha* (London 1938, Milford), pp. 31-50.—A.J.T.

² For this new vein of emotion, which was not to be found either in the primitive Buddhist philosophy or in the primitive Aryan paganism, see further pp. 135-6, below.—A.J.T.

³ Stcherbatsky, Th.: *The Conception of Buddhist Nirvana* (Leningrad 1927, Academy of Sciences of the U.S.S.R.), p. 36.

⁴ See the present chapter, pp. 86-7, above.

⁵ There was, of course, one brilliant exception to the mediocrity of this Far Eastern Greek art, and that was its coinage.

⁶ This resurrection of Hellenic art through the religious power of the Mahāyāna has been noticed, by anticipation, in III C (i) (a), vol. iii, p. 131, and III. C (ii) (a), vol. iii, p. 247, footnote 2, above. 'The art of Gandhāra was born of Buddhist piety utilizing Yavana technique' (Tarn, op. cit., p. 393, following Grousset). See further the present Study, V. C (i) (c) 3, in the present volume, p. 196, and V. C (i) (d) 6 (β), p. 481, below.

Hellenic convert the un-Hellenic religious experience of an intimate personal relation between the worshipper and his god:¹ a relation of mutual love in which the worshipper's devotion (*bhakti*)² was a response to the god's loving-kindness towards his devotee.

What was the origin of this personal religion which was both the distinctive trait of the Mahāyāna and the secret of its success? This new leaven, which changed the spirit of Buddhism so profoundly, was as alien from the native vein of the Indic as it was from that of the Hellenic philosophy.³ Was it the fruit of the

¹ The Hellenic conception of Man's relation to God is illuminatingly illustrated by some observations of Aristotle's in a passage (1158b-1159a) of his *Ethica Nicomachea*: 'There would appear to be a difference in the meaning of the term equality in its respective applications in the realm of rights and in that of friendship. In the realm of rights moral equality is primary and quantitative equality secondary, whereas in the realm of friendship this order of precedence is inverted. This is clear where there is a wide discrepancy in goodness, badness, wealth or what not; for such a discrepancy rules out not only the possibility of friendship but even the pretension to it. This is most evident in the case of gods, who enjoy a crushing superiority in advantages of all kinds; but it is also clear in the case of kings; for no pretension to friendship with kings, any more than with gods, is made by their extreme inferiors—and likewise none to friendship with the moral and intellectual *élite* by people of no account. It is, no doubt, impossible exactly to define the limit up to which friends can still remain friends in despite of a quantitative inequality between them. Friendship can survive the subtraction of many advantages [from one of the two parties], but it cannot survive where the gulf has become as broad as that which separates a god [from a man]. This raises the puzzling question whether a friend can really desire for his friend superlative advantages; for being a god is an advantage that is assuredly superlative, and yet, when your friend has become a god, you can no longer be a friend for him, and therefore no longer an asset (which is what a friend is). If, therefore, we have been right in supposing that a friend's motive in desiring advantages for his friend is altruistic, then he is bound to want his friend to remain the mere human being that he now is.'

² An analysis of the meaning of *bhakti* will be found in Eliot, Sir Ch.: *Hinduism and Buddhism* (London 1921, Arnold, 3 vols.), vol. ii, pp. 180-4.

³ The contrast between this aspect of the Mahāyāna and the authentic doctrine and ethos of the historical Buddha, Siddhārtha Gautama, is brought out very clearly in Stcherbatsky, Th.: *The Conception of Buddhist Nirvana* (Leningrad 1927, Academy of Sciences of the U.S.S.R.). 'The denial of soul as a separate substance . . . provoked, in the Buddhist community itself, opposition which grew ever stronger and resulted, five hundred years after the demise of the Master, in what may be called a quite new religion, reposing on a quite different philosophic foundation' (p. 4). 'The great change produced by the Mahāyāna consisted in the view that the Absolute was immanent to the World' (p. 34). 'The rise of the Mahāyāna was part of the same movement as the rise of the worship of Vishnu and Shiva—pantheism and a radical monism being common features of the Mahayanian and the Hindu faith (pp. 50-1). 'Buddhist art of the ancient period represented Buddha by an empty place or a symbol, which later on is replaced by a divine figure of the Apollo type. . . . The only explanation [of the former manner of representation] seems to be that the total disappearance of Buddha in Nirvana was thus given pictorial expression' (ibid., p. 36, footnote 2)—whereas, in the Mahāyāna, 'the sage Gautama became in practice, if not in theory, a god, with his ears open to the prayers of the faithful, and served by a hierarchy of Bodhisattvas and other beings acting as mediators between him and sinful men' (Smith, V. A.: *The Early History of India*, 3rd edition (Oxford 1914, Clarendon Press), p. 266). For the role of Love in the Mahāyāna see further V. C. (i) (d) 11, vol. vi, p. 164, footnote 3, below. 'The Buddha-statue played its part in that conversion of [the] Buddha from a man into a god which took place in the Mahāyāna' (Tarn, op. cit., pp. 407-8). Both the idea of representing the Buddha in human form and the earliest of the types in which this idea was worked out were of Hellenic origin; and Tarn (op. cit., pp. 395-404) demonstrates, from a piece of numismatic evidence, that the prototype of the Apollinean statue of the Buddha must have been carved, at latest, early in the last century B.C. The Indic artists accepted the Hellenic device of anthropomorphism but discarded the Apollinean type in favour of a more spiritual representation of their saviour (ibid., pp. 405-7).

spiritual experience of an Indic internal proletariat which had previously been ignored by the supercilious philosopher-members of the dominant minority, and which was belatedly entering into its kingdom now that the philosophers' confidence in their own spiritual powers had been shaken by the impact of Hellenism? This conjecture is suggested by the fact that the Mahāyāna was not the only Indic 'higher religion' in which the spirit of *bhakti* made its appearance.¹ Or was this vital fire in the Mahāyāna no Indic fire at all, but a spark caught from the Syriac flame which had already kindled Zoroastrianism and Judaism and was soon to kindle Mithraism and Christianity as well? This latter conjecture is commended by the chronological fact that the epiphany of the Mahāyāna was preceded by the fusion of Indic with Syriac populations under the rule of the Greek kings of Bactria and their Kushan successors. In default of patent evidence, however, we must confess that the provenance of the vital element in the Mahāyāna is still uncertain.² We must be content to take note of the fact that, with the arrival of this Buddhaic 'higher religion' upon the scene, the religious history of the Indic Society began to take the same course as that of the Syriac Society which we have already surveyed.

As a 'higher religion' which went forth from the society in whose bosom it had arisen in order to evangelize a dominant Hellenic World, the Mahāyāna is manifestly an Indic counterpart of Christianity and Mithraism; and, with this key in our hands, we can easily identify the respective Indic counterparts of the other rays into which the light of Syriac religion was diffracted by the interposition of a Hellenic prism. If we look for the Indic equivalent of those 'fossils' of the pre-Hellenic state of the Syriac Society that have survived in the shapes of the Jewish and Parsee 'Diasporas', we shall find what we are looking for in the latter-day Hinayanian Buddhism of Ceylon and Burma and Siam, which is a relic of the pre-Mahayanian philosophy of Siddhārtha Gautama and a 'fossil' of the Indic Society as it was before Demetrius of Bactria crossed the Hindu Kush.³ Again, if we look for the Indic equivalent of a later-deposited stratum of Syriac 'fossils' which is represented by the Nestorian and Mono-

¹ It asserted itself simultaneously in the rise of the post-Buddhaic religion of Hinduism (see p. 138, below).

² The hypothesis of a Zoroastrian provenance is combated by Thomas, E. J.: *The History of Buddhist Thought* (London 1933, Kegan Paul), pp. 178-9. On the other hand it is more favourably entertained by Eliot, Sir Ch.: *Hinduism and Buddhism* (London 1921, Arnold, 3 vols.), vol. iii, pp. 218-22. In particular, Sir Charles Eliot points out the singular closeness of the resemblance between Amitābha's paradise and Ahuramazda's. Cf. *ibid.*, vol. cit., pp. 451-4.

³ For these Hinayanian 'fossils' of an extinct Indic Society see I. B (iii), vol. i, p. 35, and I. C (i) (b), vol. i, pp. 90-2, above.

physite 'Diasporàs' and fastnesses to-day, we shall find what we are looking for, here again, in the latter-day Tantric Mahayanian Buddhism of Tibet and Mongolia.¹ We have sought to explain Nestorianism and Monophysitism as a pair of Syriac attempts to combat Hellenism, not by the crudely militant tactics of Macabaeian Judaism and Sasanian Zoroastrianism, but by the subtler method of purging the Hellenic alloy out of the Syro-Hellenic religious syncretism of Christianity.² On this analogy we may discern in the Tantric version of the Mahāyāna an attempt to provide a 'de-Hellenized' variety of an Indic religion for those 'Zealots' in the Indic World in whose eyes the Catholic form of the Mahāyāna was vitiated—whether they were aware or not of the true reason for their distaste—by its Hellenic tinge. At any rate, the Tantric version of the Mahāyāna had the same fate as Nestorianism and Monophysitism in missing fire;³ and, just as the Syriac Society had to wait for the emergence of Islam in order to lay its hand upon a religion which was capable of serving as an effective instrument for casting Hellenism out, so we find that the complete and final expulsion of the intrusive Hellenic spirit from the Indic body social was accomplished, not through a 'de-Hellenized' version of the Mahāyāna, but through the purely Indic and utterly un-Hellenic religious movement of post-Buddhaic Hinduism.

This post-Buddhaic Hinduism, which eventually provided the internal proletariat of the Indic Society with its universal church, is an elusive creature. If we fix our attention upon the fact that—in deliberate reaction against every form of Buddhism, pristine or transfigured, philosophic or religious—Hinduism accepts and consecrates the social ascendancy of the Brahman caste, we may be inclined to see nothing more in Hinduism than an archaistic⁴ revival of the primitive paganism of the barbarian Aryas whose *Völkerwanderung* into India out of the Eurasian Steppe was the prelude to the birth and growth of the Indic

¹ For the conversion of the Mongols and the Calmucks to this Tantric form of the Mahāyāna see Part III. A, Annex II, vol. iii, p. 451, IV. C (iii) (c) 3 (a), vol. iv, p. 497, and the present chapter and volume, p. 116, above.

² See II. D (vii), vol. ii, pp. 286-7, and the present chapter and volume, p. 127, above.

³ The parallelism in the diffraction of the Syriac and the Indic religion has a politico-geographical aspect which has been touched upon already in II. D (vi), Annex, vol. ii, p. 405, footnote 1, above. The Tantric version of the Mahāyāna, like the Nestorian form of Christianity, found an asylum beyond the political pale of Hellenism—Nestorianism in 'Irāq, beyond the eastern frontier of the Roman Empire; the Tantric Mahāyāna in Bengal, beyond the eastern limits of the Bactrian and the Kushan Kingdom. When Nestorianism was supplanted in the plains of 'Irāq by its more effective successor Islam, it found a fastness for itself in the highlands of Kurdistan and a new world to conquer on the Eurasian Steppe. Similarly the Tantric Mahāyāna held out upon the plateau of Tibet and eventually spread from Tibet into Mongolia after the Nestorian 'Diasporā' in Mongolia had died out.

⁴ For the phenomenon of Archaism in the field of Religion see V. C (i) (d) 8 (δ), vol. vi, pp. 83-94, below.

Civilization;¹ for this Aryan paganism had continued to hold the field in the Indic World until the breakdown of the Indic Civilization evoked the 'mental strife' that expressed itself in the Jain and Buddhist philosophies, and one of the outstanding features in the development of this primitive religion during the growth-phase of Indic history was a steady increase in the Brahmans' prestige and power. On the other hand, if we contemplate the philosophical side of the post-Buddhaic Hinduism, and observe how, among those Hindus who claim to be the greatest adepts, this aspect of Hinduism tends to push all other aspects into the background, we may be inclined to see in Hinduism, not a revival of Aryan paganism, but a mimesis of Buddhist philosophy.² We shall not, however, divine the essential nature of Hinduism until we turn our eyes to that personal relation between the god and his devotee³ which—in contrast to the primitive pre-Buddhaic Aryan paganism⁴—the Hindu worships of Vishnu and Shiva have in common with the Mahayanian worships of the Bodhisattvas⁵ and the Egyptiac worship of Isis and the Hittite worship of Cybele and the Syriac worships of Mithras and Christ;⁶ and in the light of this comparison we shall perceive that, under a twofold disguise, this Hinduism is in truth a representative of that now familiar 'higher' species of religions that are brought to birth, out of the agony of disintegrating civilizations, by the poignant spiritual experience of their internal proletariats.

¹ For this Völkerwanderung of the Aryas see I. C (i) (b), vol. i, pp. 104-7, above.

² The Mahāyāna did not, of course, cease to be a philosophy in becoming a religion as well. In fact, its metamorphosis into a religion was a consequence of its particular philosophic bent, and it is this Mahayanian bent that is followed by the post-Buddhaic Hindu philosophy of the Vedānta. (For the points in common between the Mahayanian philosophy and the Vedānta, and for the reciprocal influence of these two philosophies upon one another from the first to the seventh century after Christ, see Stcherbatsky, Th.: *The Conception of Buddhist Nirvana* (Leningrad 1927, Academy of Sciences of the U.S.S.R.), pp. 38 and 61; Eliot, Sir Ch.: *Hinduism and Buddhism* (London 1921, Arnold, 3 vols.), vol. i, p. xi; vol. ii, p. 211.)

³ See Aiyangar, S. K.: *Some Contributions of South India to Indian Culture* (Calcutta 1923, University Press), pp. 209, 212, and 228.

⁴ For the differences between the pre-Buddhaic religion of the Vedas and the post-Buddhaic Hinduism see Eliot, Sir Ch.: *Hinduism and Buddhism* (London 1921, Arnold, 3 vols.), vol. ii, pp. 136-9.

⁵ See p. 136, footnote 1, above. For the common origin of the Hindu worships of Vishnu and Shiva and the Mahayanian cults of Bodhisattvas see Eliot, Sir Ch.: *Hinduism and Buddhism* (London 1921, Arnold, 3 vols.), vol. ii, p. 12; Thomas, E. J.: *The History of Buddhist Thought* (London 1933, Kegan Paul), pp. 178 and 194. For the affinity and contemporaneity of the Hindu worship of Krishna with the Mahayanian cult of Amitābha see Eliot, *Japanese Buddhism*, pp. 87 and 392-3.

⁶ While these Indic and Syriac worships can all be classed in one category in virtue of the personal relation, which is to be found in them all, between the worshipper and his god, Christianity differs from all the rest in demanding a devotion that is not merely personal and emotional but is also exclusive. For this difference between Christianity and the worships of Vishnu and Shiva see further V. C (i) (d) 7, vol. vi, pp. 47-9, below. For the possibly Hellenic and Syriac origin of the anthropomorphism and image-worship which are two of the most conspicuous non-Vedic features of the post-Buddhaic Hinduism, see Eliot, *Hinduism and Buddhism*, vol. ii, pp. 139 and 171-5.

We have seen that the Indic philosophy—and the religion into which it was transformed at a certain stage of its development—was diffracted, like the Syriac religion, into four separate rays of philosophic or religious light, and that two of the four (namely the authentic philosophy of Siddhārtha Gautama and the Tantric version of the Mahāyāna) proved abortive, while the Catholic form of the Mahāyāna radiated out of the Indic into the Hellenic World and the post-Buddhaic religion of Hinduism won the allegiance of the Indic internal proletariat in the last chapter of the story. Up to this point the history of the Catholic Mahāyāna corresponds with the history of Catholic Christianity, which likewise found its field of action in the Hellenic World instead of devoting itself to the conversion of the non-Hellenic society from whose bosom it had sprung; but there is a further chapter in the history of the Catholic Mahāyāna to which the history of the Catholic Christian Church can show no parallel.

In the history of Catholic Christianity the first migration was also the last; for, when the Church had conquered the Hellenic World and had taken upon its own head the responsibility for acting as this moribund civilization's executor and residuary legatee, it stood steadfast at its self-appointed post and offered itself as a shelter from the storm during the terrible tribulation of the post-Hellenic interregnum, until, with the slow passage of Time, two new Christian civilizations, both affiliated to the Hellenic, came to birth and began to grow up under the Church's aegis.¹ This lasting association between the legacy of the Hellenic Society and the work of the Catholic Christian Church is not reproduced in the relation between the Hellenic Society and the Catholic Mahāyāna. The Mahāyāna did, indeed, eventually emulate the Christian Church in linking its own fortunes—'for better for worse, in sickness and in health'—with those of a moribund civilization, but it was not in the Hellenic World that it found this permanent partner. Whereas the Christian Church established its head-quarters, once for all, within the pale of the Roman Empire, the Mahāyāna only tarried for a short breathing-space within the limits of the Kushan 'successor-state' of the Greek Kingdom of Bactria²—a semi-barbarian commonwealth which was the counterpart of the Roman Empire in the eastern extremity of the Hellenic World during the first few centuries of the Christian Era. The reception which the Mahāyāna met with in the Kushan Kingdom offered it every

¹ For the affiliation of the Western and the Orthodox Christian Civilization to the Hellenic Civilization through the mediation of the Catholic Christian Church see I. B (iv), vol. i, pp. 39-44; I. C (i) (a), vol. i, pp. 52-63; I. C (i) (b), vol. i, pp. 63-7, above, and Part VII, below.

² For the relation of the Kushan Rāj to the Bactrian Greek Rāj see p. 133, footnote 1, above.

inducement to settle down; for the Kushan King Kanishka (*regnat circa* A.D. 78-123)¹ was as solicitous a patron of the nascent Buddhist 'higher religion' as the Roman Emperor Constantine was of Catholic Christianity.² But, while the policy of the Kushan Crown was an invitation to the Mahāyāna to cease from its pilgrimage, the social geography of the Kushan Kingdom was an incitement to move on; for, unlike the Roman Empire, the Kushan Kingdom was not a terminus; it was a 'roundabout' on which four roads converged: one from the Indic World, one from the Syriac, one from the Hellenic, and one from the Sinic.³ When, under a Kushan régime which had 'abolished the Hindu Kush', the Mahāyāna made its passage out of the Indus Valley into the Oxus-Jaxartes Basin, it found that it could not halt here and dig itself in; it had to travel on along one or other of the three alternative roads that now opened up before its face; and the circumstances of the age decided that, at this parting of the ways, the Mahāyāna should take the Sinic turning. Travelling across the extremity of a superficially expanded Hellenic World and of the temporarily buried Syriac World which lay beneath it, the Mahāyāna completed its long and devious journey from its Indian birth-place to the Far Eastern scene of its life-work by a route which skirted three sides of the four-square Tibetan bastion.⁴ It was the destiny of the Mahāyāna to play in the Far East, among the ruins of the Sinic universal state of Ts'in and Han, the role of universal church which was played by the Catholic Christian Church in the Western and the Orthodox Christian worlds among the ruins of the Hellenic universal state that had been embodied in the Roman Empire.

In order to understand the triumphal progress of the Mahāyāna in a Sinic World which was geographically so remote from the Mahāyāna's Indian homeland, we have to examine the history of the Sinic internal proletariat.

Considering the intensity of the tribulation of the Sinic 'Time of Troubles' when it was reaching its climax during 'the Period of Contending States',⁵ we should expect *a priori* to find an internal

¹ Smith, V. A.: *The Early History of India*, 3rd edition (Oxford 1914, Clarendon Press); p. 270. According to Tarn, W. W.: *The Greeks in Bactria and India* (Cambridge 1938, University Press), p. 352, Kanishka died twenty years earlier, in A.D. 103.

² The stages of Kanishka's cautious and gradual conversion from a rather artificial and frigid religious syncretism to the ardent and single-minded proletarian faith that was sweeping over his dominions can be traced—like the development of the similar religious experience of Constantine—in the images and superscriptions on the princely convert's coins (see Smith, V. A.: *The Early History of India*, 3rd edition (Oxford 1914, Clarendon Press), pp. 265-6; Eliot, *Hinduism and Buddhism*, vol. ii, p. 87).

³ For this historical function of the Kushan Empire as a cultural corridor see II. D (vii), vol. ii, pp. 372-3, above.

⁴ For this extraordinary route see II. D (vii), vol. ii, p. 373; II. D (vi), Annex, vol. ii, p. 405, footnote 1; III. C (i) (a), vol. iii, p. 131, above.

⁵ See I. C (i) (b), vol. i, pp. 88-90, above, and V. C (ii) (b), vol. vi, pp. 291-5, below.

proletariat being generated on the grand scale in the Sinic World of that age, and this expectation is confirmed by the historical evidence. We can watch the Sinic internal proletariat being recruited from the three regular sources: uprooted members of the disintegrating society's native body social; conquered members of alien civilizations; and conquered barbarians. The first source was drawn upon by the founder of the Sinic universal state, Ts'in She Hwang-ti (*imperabat* 221¹–210 B.C.), when he transplanted some of the desirable elements in the population of his empire in order to fill the new capital city which he had laid out,² and some of the undesirable elements in order to colonize the barbarian territories which he was annexing in the south.³ The forcible enrolment of barbarians was carried out over a longer period and on a vaster scale; and it was by this method that the Sinic World had already expanded, during its 'Time of Troubles',⁴ from the modest domain in the middle and lower valley of the Yellow River, which had sufficed for its birth and growth,⁵ over an area which extended to the south-eastern fringes of the Eurasian Steppe in one direction and towards the southern watershed of the Yangtse Basin in another. North-westward the process of turning recalcitrant barbarians into domesticated proletarians was already complete by Ts'in She Hwang-ti's time, when on this front the Sinic Civilization found itself in direct contact, all along the line, with the alien civilization of the Eurasian Nomads.⁶ On the southern front the process was carried on steadily and systematically under the Ts'in and Han régimes until, rather more than a hundred years after the foundation of the universal state, it was completed, in this direction likewise, *circa* 112–111 B.C.,⁷ by the annexation of the southern sea-board—including the territories that now constitute the French possessions of Tongking and Annam, as well as the sites of the present Chinese provinces of Kwangsi and Kwangtung and Fukien

¹ The year 221 B.C. was that in which Chêng Wang of Ts'in took the title of She Hwang-ti ('First Universal Monarch') after the overthrow of Ts'î, which had been the last surviving Great Power, apart from Ts'in itself, in the Sinic arena. As local King of Ts'in, Chêng had been on the throne since 246 B.C.

² See Cordier, H.: *Histoire Générale de la Chine* (Paris 1920–1, Geuthner, 3 vols.), vol. i, p. 202; and compare the Armenian successor of the Seleucidae, Tigranes', resort to the same method of barbarism in order to populate Tigranocerta (*circa* 77 B.C.).

³ See Franke, O.: *Geschichte des Chinesischen Reiches*, vol. i (Berlin and Leipzig 1930, de Gruyter), p. 244.

⁴ If the hall-mark of the Sinic 'Time of Troubles' is the militarization of the states into which the Sinic body social had come to be articulated, its beginning is probably to be dated, as we have seen (in IV. C (ii) (b) 1, vol. iv, p. 66, above), from the outbreak of the first great war for hegemony in 634 B.C. From this time onwards the surrounding barbarians were drawn into the Sinic vortex on an ever-increasing scale—partly through being conquered by the original states-members of the Sinic constellation, and partly through being compelled to sinify themselves (as Urartu babylonized herself) because this was their only chance of self-preservation.

⁵ For the cradle of the Sinic Civilization see II. C (ii) (b) 2, vol. i, pp. 318–21.

⁶ See II. D (v), vol. ii, pp. 118–19, above.

⁷ Cordier, op. cit., vol. i, p. 212; Franke, op. cit., vol. i, pp. 321–4.

and Chekiang. Before the vast barbarian recruitment of the Sinic internal proletariat was thus brought to a close, the enrolment of members of alien civilizations had already begun, and it was the introduction of this third element into the ranks of the Sinic internal proletariat that inoculated the now moribund Sinic body social with the Mahāyāna.

Sinic statesmanship found the Eurasian Nomads, with whom it was now in direct contact on its north-western front, more difficult neighbours to deal with than the sheerly barbarian highlanders by whom the Sinic World had previously been surrounded—on the one side in Shansi and Shensi, and on the other side along the watershed between the Yangtse and the southern seaboard—and had thus been completely insulated from all other societies of its own species. Ts'in She Hwang-ti himself sought to solve this new problem of 'contact' in negative terms by consolidating into one continuous Great Wall the local fortifications which had been erected against the Nomads by his predecessors on the throne of Ts'in and by the princes of the neighbouring Sinic states that had likewise come to march with the Eurasian Steppe.¹ This enormous work was put in hand in 215 B.C.; yet, even with one of the material Wonders of the World to back it, a merely defensive strategy was found by the rulers of the Sinic universal state to be inadequate for coping with the power of the Hiongnu;² and eventually the Han Emperor Wuti (*imperabat* 140–87 B.C.) passed over to the offensive and launched against the Hiongnu a war of aggression which lasted nearly a hundred years (133–36 B.C.) before it resulted in a temporary pacification, under a *Pax Sinica*, of the Nomads' ranges as far westward as the Zungarian Gap.³ In respect of achieving its main purpose—which was to solve the problem of dealing with Nomad neighbours—Wuti's policy was hardly more successful than Ts'in She Hwang-ti's, for the offensive against the Hiongnu strained the resources of the Sinic universal state almost to breaking-point⁴ without permanently relieving it of its Nomad adver-

¹ See II. D (v), vol. ii, p. 119, above, as well as Cordier, *op. cit.*, vol. i, pp. 206–7, and Franke, *op. cit.*, vol. i, pp. 240–4.

² The record of the relations between the Sinic universal state and the Nomad Empire of the Hiongnu from the reign of Ts'in She Hwang-ti to the reign of Han Wuti gives the impression that, with the passage of time, the pressure of the Nomads was bearing harder and harder upon the sedentary Power behind the Great Wall. This may have been the effect of a bout of aridity on the Steppe, if there is any truth in the theory of climatic pulsations (for this theory and its application to the problem of the periodic eruptions of the Nomads see Part III. A, Annex II, in vol. iii, above); or it may have had nothing to do with the Nomadism of the Hiongnu, but have been simply an instance of the working of one of the general laws (see Part VIII, below) that govern the relations between a civilization and its barbarian neighbours when they are in long-continuing contact with one another along a stationary frontier.

³ For the great war between the Prior Han and the Hiongnu see Franke, *op. cit.*, vol. i, pp. 334–57.

⁴ The strain of the great war on the Steppes may have been one of the causes of the

saries. An incidental consequence, however, of this hazardous forward policy against the barbarians on the Eurasian Steppe was the astonishing discovery that on the farther coast of this arid ocean¹ there was another world—or, rather three other worlds: the Indic, the Syriac, and the Hellenic.² In the last quarter of the second century B.C. the eastern outposts of these new worlds, in the oases of the Tarim Basin,³ were annexed to the Sinic universal state;⁴ their inhabitants were incorporated into the Sinic internal proletariat; and the descendants of these new alien recruits were the carriers of the Mahāyāna, in which the Sinic internal proletariat ultimately found the spiritual bread that it had never been

momentary breakdown of the Sinic universal state during the interregnum between the Prior and the Posterior Han in the first quarter of the first century of the Christian Era (for this interregnum see V. C (i) (c) 3, p. 271, and V. C (ii) (b), vol. vi, p. 295, below).

¹ For the analogy between the Steppe and the Ocean see Part III. A, vol. iii, pp. 7-8, with Annex I, above.

² The discovery was made by a party—half exploring expedition and half diplomatic mission—which was sent out into the Unknown West by the Emperor Wuti in 138 B.C., when he was making up his mind to take the offensive against the Hiongnu, and which duly returned to Ch'ang Ngan in the winter of 126/5 B.C. after having discovered Bactria and Parthia (Franke, op. cit., vol. i, pp. 334 and 337-40; Tarn, W. W.: *The Greeks in Bactria and India* (Cambridge 1938, University Press), pp. 279-84). To Sinic minds in the second century B.C. the news brought back by this party must have been even more astonishing than it was for Western minds to learn of the discovery of the Central American and Andean civilizations on the other side of the Atlantic in the sixteenth century of the Christian Era. For Western minds in that age the surprise was particular and not general, since the Western Society had always been aware that there were other societies of its own species in existence besides itself (e.g. Orthodox Christendom and the Syriac Society with its Iranian and Arabic offspring). On the other hand the members of the Sinic Society had always supposed—until the return of Chang K'ien's party to Ch'ang Ngan in 126/5 B.C.—that the Sinic Civilization was the solitary representative of its species in a universe whose only other human denizens were barbarians and savages; and, to minds brought up in this belief, the discovery of the existence of the Indic, Syriac, and Hellenic civilizations must have been as revolutionary in its intellectual effect as the sixteenth-century Western astronomical discovery that the stellar universe was not geocentric. We may compare the discovery of the Babylonian and Hittite civilizations by the members of the Egyptian Society, in the fifteenth century B.C., in the course of their counter-offensive, across the desert of Sinai, against the Hyksos Eurasian Nomad cousins of the Hiongnu.

³ In the Tarim Basin, by the time when it came within the Sinic Society's purview in the last quarter of the second century B.C., the elements of the three non-Sinic civilizations which had previously arrived on the scene were already blended; but the Indic element was here still predominant over the Syriac and the Hellenic. According to the local tradition of the Khotan oasis, which has been preserved in a Tibetan medium, the city was founded by settlers from India in Aśoka's time, and Buddhism was introduced from India 170 years later (Sir Charles Eliot: *Hinduism and Buddhism* (London 1921, Arnold, 3 vols.), vol. iii, p. 211; Smith, V. A.: *The Early History of India*, 3rd edition (Oxford 1914, Clarendon Press), p. 193). 'In the Turfan frescoes, the drapery and composition are Indian', while 'the faces are Eastern Asiatic (sometimes, however, they represent a race with red hair and blue eyes)'; and 'the paintings testify to the invasion of Far Eastern art by the ideas and designs of Indian Buddhism rather than to an equal combination of Indian and Chinese influence' (Eliot, op. cit., vol. iii, p. 195).

⁴ The way was first cleared by the conquest, in 121 B.C., of the intervening barrier of Hiongnu territory in the present Chinese province of Kansu. The actual conquest of the Tarim Basin itself was carried out in 104-101 B.C. (Franke, op. cit., vol. i, pp. 342-9). The moment was favourable, since the Greek Power in Bactria had just been overwhelmed, and the Parthian Power in Khurāsān was still hard beset, by the eruption of the Sakas and the Yuechi across the threshold of the Eurasian Steppe between the Pamirs and the Caspian.

able to extract from the Confucian and Taoist philosophies of the Sinic dominant minority.

The transmission of the Mahāyāna along this channel was actually facilitated by the vicissitudes in the political relations between the Sinic universal state and its western dependencies during the three centuries that elapsed between the first assertion of Sinic authority over the Tarim Basin at the end of the second century B.C. and the final break-up of the Sinic universal state itself at the turn of the second and third centuries of the Christian Era.

After having lasted for rather more than a century, the first period of Sinic rule in the Tarim Basin came to an end in A.D. 16,¹ when the collapse of the Prior Han Dynasty enabled the Hiongnu to shake off the Sinic yoke and the oasis-states to repudiate their allegiance; and it was not till A.D. 73 that the Posterior Han, after having re-established the Han Empire in the home-provinces, felt themselves strong enough to begin the reconquest of the lost western dependencies. Thanks to the abilities of one great military commander and colonial administrator, Pan Ch'ao, the enterprise was successfully accomplished by the end of the first century of the Christian Era;² and at the moment when the hero re-entered Loyang in triumph in A.D. 102 the westward extension of the Sinic universal state was as wide as it had been in 101 B.C. Pan Ch'ao, however, found no worthy successor; the reconquered peoples became restive as soon as his masterly hand was withdrawn; and this time there was an alien Power on the horizon which could venture to cross swords with the sovereign of 'All that is under Heaven'.

When the Prior Han Emperor Wuti made the first Sinic conquest of the Tarim Basin, the Greek Power in Bactria had just been overwhelmed by the eruption of the Saka and Yuechi Nomads out of the Eurasian Steppe;³ but while Pan Ch'ao (*militabat* A.D. 73-102) was campaigning in Central Asia, Kanishka (*regnabat circa* A.D. 78-123) was completing the expansion of one of the five petty Yuechi 'successor-states' of Bactria into a Philhellene barbarian kingdom which was as extensive and as powerful as the Bactrian Greek principality at its apogee.⁴ In A.D. 90 Kanishka sent an army into the Tarim Basin to dispute Pan Ch'ao's advance, and drew upon himself an ignominious defeat;⁵ but after Pan Ch'ao's disappearance from the scene Kanishka repeated his attempt and this time

⁴ See p. 133, with footnote 1, above.

⁵ Smith, V. A.: *The Early History of India*, 3rd edition (Oxford 1914, Clarendon Press), pp. 251-2.

he succeeded in wresting the greater part of the Tarim Basin out of Sinic hands and bringing it under his own suzerainty.¹ Thereafter the command over the Tarim Basin appears to have been disputed between the Kushan and the Han until both Powers broke down and disappeared in the early decades of the third century of the Christian Era.² The details of the history of this frontier warfare are obscure³ and unimportant; but the entry of the Mahāyāna into the Sinic World through the avenue of this disputed territory in the course of the second century of the Christian Era is a fact which is as certain as it is momentous.⁴ By the time when, at the turn of the second and third centuries, the Sinic universal state broke up and the Sinic Civilization went into dissolution, the Mahāyāna had effectively established its claim

¹ Smith, op. cit., pp. 262-3. This reconstruction of events would be difficult, though not impossible, to reconcile with the chronological scheme (see p. 140, footnote 1, above) which dates Kanishka's death A.D. 103 instead of A.D. 123.

² See II. D (vii), vol. ii, p. 373, above.

³ Dated documents that have been recovered by our modern Western archaeologists from the military frontier of the Han Empire in the neighbourhood of Tun-huang show that the Han were in effective occupation of this point between A.D. 98 and A.D. 153 (Eliot, Sir Charles: *Hinduism and Buddhism* (London 1921, Arnold, 3 vols.), vol. iii, p. 193).

⁴ See IV. C (ii) (b) 1, vol. iv, p. 65, above. The story of the deliberate introduction of Buddhism into the Han Empire in the seventh decade of the first century of the Christian Era by the Emperor Mingti (*imperabat* A.D. 58-75), in obedience to a dream, is rejected as legendary by Franke (op. cit., vol. i, pp. 407-8), who points out the unlikelihood of such a transaction having taken place before the reconquest of the Tarim Basin by Pan Ch'ao. Our own dating of the introduction of Buddhism into the Sinic World will differ greatly according to whether we are speaking of the new Mahayanian religion, to which the Kushan King Kanishka became a convert in the first or second century of the Christian Era, or of the pre-Mahayanian philosophy which was adopted in the third century B.C. by the Mauryan Emperor Aśoka. Whereas the Mahāyāna—which was itself only nascent in Kanishka's generation—can hardly have entered upon its conquest of the Sinic World before Kanishka's conversion to the faith and conquest of the Sinic dependencies in the Tarim Basin, the pre-Mahayanian philosophy of Siddhārtha Gautama may have become known in the Sinic World at any time after the dispatch of Chang K'ien's exploring party into the Western *terra incognita* in 138 B.C. For the Hinayanian Buddhist philosophy and the Mahayanian Buddhist religion travelled from their common original centre of dispersion in Northern India in successive waves (see II. D (vi), Annex, vol. ii, p. 405, footnote 1, above); and the Hinayanian wave, which was set in motion by the Indic Emperor Aśoka (*imperabat* 273-232 B.C.), if not by the private enterprise of earlier philosophic missionaries, may well have reached the Oxus-Jaxartes Basin, and even the Tarim Basin, within a hundred years of Aśoka's death. Franke (op. cit., vol. i, pp. 408-9) calculates—on the strength of a casual reference, in the Sinic records, to the presence of Buddhist monks and laymen as far afield as the present Chinese province of Kiangsu in A.D. 65—that Buddhism must have begun to penetrate the Sinic World before the beginning of the Christian Era. If this inference is legitimate, the Buddhism in question must, of course, have been of the pre-Mahayanian school; for the conception of the Mahāyāna is not older than the first century of the Christian Era; the doctrine of the Fathers who attended Kanishka's oecumenical council *circa* A.D. 100 was not the full-blown flower of the Mahayanian Faith (see Eliot, *Hinduism and Buddhism*, vol. ii, pp. 78-82); and the differentiation of the Mahāyāna from the Hinayāna was not yet complete in the second century when the Buddhist impulse was being transmitted from the Kushan Kingdom to the Han Empire via the disputed territory in the Tarim Basin. According to Sir Charles Eliot (*Hinduism and Buddhism* (London 1921, Arnold, 3 vols.), vol. iii, p. 213), the Mahāyāna and the Hinayāna were still not wholly disentangled from one another in the Tarim Basin in the fifth and sixth centuries of the Christian Era, and the Hinayāna still survived in Kuchā, on the northern rim of the Tarim Basin, when the Far Eastern Buddhist pilgrim, Hiuen Tsiang (Yuan Chwang), passed that way *circa* A.D. 629 (Eliot, op. cit., vol. iii, pp. 205 and 211). The problem discussed in this footnote has been dealt with, by anticipation, in IV. C (ii) (b) 1, vol. iv, p. 65, footnote 4, above.

to act—like Christianity, two centuries later, in the Hellenic World—as the moribund society's executor and residuary legatee.

If imitation is the sincerest flattery, the hold which the Mahāyāna had already gained, by this time, upon the imagination and emotions of the Sinic internal proletariat may be gauged from the fact that, in the Sinic World in this age, one of the indigenous philosophies of the Sinic dominant minority was transformed into a proletarian religion through a metamorphosis which was perhaps even more extraordinary than that which had conjured the Mahāyāna itself out of the philosophy of Siddhārtha Gautama.¹

The Sinic philosophy of the Tao, which had been first propounded, like the Confucian philosophy, during the Sinic 'Time of Troubles', as a response to the challenge of the breakdown of the Sinic Civilization,² was distinguished from the Confucian sister school by an attitude towards life which rather resembled the Buddha's. The essence of the Tao was its belief in the supreme virtue and efficacy of inaction—in which, by a paradoxical but penetrating intuition, the Taoist philosopher saw the most intense and creative form of true activity.³ A doctrine which thus not only condemned violence but went so far as to deprecate exertion of every kind, seemed marked out to be an esoteric discipline which would never be appreciated or practised by more than a few rare spirits; and it is somewhat surprising to find a 'Taoism' in which the genuine 'way' was vulgarized into a mere policy of *laissez faire* laying itself out to meet the needs of practical men in the age of lassitude which followed the refoundation of the Sinic universal state by Liu Pang, the first Emperor of the Han Dynasty. During the first half of the second century B.C. this travesty of Taoism actually anticipated Confucianism both in winning acceptance as the official philosophy of the Sinic universal state⁴ and in purchasing this worldly success at the price of debasing itself into magic;⁵ and when, in the reign of the Emperor Wuti (*imperabat* 140–87 B.C.), Confucianism succeeded in supplanting Taoism once for all at the official centre of the Middle Kingdom, the discomfited practical philosophy did not give up the game, but went underground and retreated into the provinces—lying low and biding its time until at length, when the Sinic universal state broke up, the name of Taoism attached itself to a proletarian 'church'⁶—with

¹ See Eliot, Sir Ch.: *Hinduism and Buddhism* (London 1921, Arnold, 3 vols.), vol. iii, pp. 227–9.

² See I. C (i) (b), vol. i, p. 89, above.

³ For this cardinal doctrine of the Tao see III. C (i) (c), vol. iii, pp. 187–9, above, and V. C (i) (d) 4, in the present volume, pp. 415–17, below.

⁴ See V. C (i) (d) 4, pp. 418–19, below.

⁵ See Hackmann, H.: *Chinesische Philosophie* (Munich 1927, Reinhardt), p. 225.

⁶ See the present chapter and volume, p. 178, footnote 1, and also V. C (i) (d) 6 (δ), p. 557, below. In the preceding generation Taoism had been taken up again, at the centre of the Sinic universal state, by the Posterior Han Emperor Huan-ti (*impera-*

monasteries, temples, and liturgical observances on the Mahayanian pattern¹—which sprang into existence, and converted the population *en masse*, in those *ci-devant* barbarian territories on the south-western fringes of the Sinic World whose inhabitants had been forcibly enrolled in the Sinic internal proletariat through the conquests that were made in this direction by Ts'ing She Hwang-ti and his Prior Han successors.² If this metamorphosis is extraordinary, it is more extraordinary still to see the name of the pacific Tao being taken in vain in order to give a religious sanction of legitimacy and guarantee of success to an armed proletarian insurrection against the Han régime which broke out in the last quarter of the second century of the Christian Era in the wild hill-country on the border between the present provinces of Shensi and Szechwan.³

It will be seen that the history of the Sinic Civilization conforms very closely, in its disintegration-phase, to the Hellenic pattern. In the misguided hands of a minority that was dominant without being creative, the disintegrating society ran its course from breakdown to dissolution through a 'Time of Troubles' and a universal state and an interregnum; there was a secession of the proletariat; and the internal proletariat found for itself, in the Mahāyāna, a universal church which played the part of the Catholic Christian Church in the foundering Hellenic World, while the abortive Taoist Church may be compared with the abortive Neoplatonic Church of Iamblichus and Maximinus Daia and Julian the Apostate and Sallustius.⁴ If we turn next to the history of the disintegration of the Sumeric Civilization, we shall observe that, up to a point, the phenomena are the same, but that the plot of the play does not work out to the same dénouement.

The Legacy of the Sumeric Internal Proletariat.

In Sumeric, as in Sinic and Hellenic, history we can discern a 'Time of Troubles' and a universal state⁵ and an interregnum;

bat A.D. 147-68) (Hackmann, H.: *Chinesische Philosophie* (Munich 1927, Reinhardt), p. 249).

¹ Franke (op. cit., vol. i, p. 420) inclines to the belief that the outward organization of this latter-day 'Taoist' proletarian church was a conscious imitation of the contemporary organization of the Mahāyāna. Compare the relation of the Ryōbō Shinto Church to the popular Japanese adaptations of the Mahāyāna in the Japanese 'Time of Troubles'.

² See p. 141, above.

³ For this insurrection and its Taoist colouring see Cordier, H.: *Histoire Générale de la Chine* (Paris 1920-1, Geuthner, 3 vols.), vol. i, pp. 189-90; Hackmann, H.: *Chinesische Philosophie* (Munich 1927, Reinhardt), p. 228; Franke, op. cit., vol. i, pp. 419-21. In the present chapter of this Study this latter-day aberration of Taoism is referred to again on p. 178, footnote 1, below.

⁴ For this abortive Neoplatonic Church see further V. C (i) (d) 6 (δ), pp. 565-7; V. C (i) (d) 6 (δ), Annex, pp. 680-3; and V. C (ii) (a), vol. vi, pp. 222-3, below.

⁵ For the foundation of this Sumeric universal state—'the Empire of Sumer and Akkad'—by Ur-Engur of Ur circa 2298 B.C., and its restoration circa 1947 B.C. by Hammurabi, see I. C (i) (b), vol. i, p. 106, above, and V. C (ii) (b), vol. vi, pp. 296-7, below.

and the Sumeric, like the Sinic and the Hellenic, Society was compensated for its own dissolution by becoming 'apparented' to younger societies of its own species. The Babylonian and Hittite societies appear to stand to the Sumeric as the main body of the Far Eastern Society in China and its branch in Korea and Japan stand to the Sinic Society, or as the Western and Orthodox Christian societies stand to the Hellenic Society. These points of likeness are offset, however, by one striking difference. In the relation between the Hellenic and Sinic societies and the younger civilizations that were respectively affiliated to them, the link was provided by a universal church which had been created or adopted by the internal proletariat of the disintegrating 'apparented' society and which eventually served as a chrysalis out of which the nascent 'affiliated' societies emerged.¹ The Mahāyāna provided a link of this kind between the Sinic Society and the two Far Eastern societies, and the Catholic Christian Church mediated in the same way between the Hellenic Society and the two Christendoms. On the other hand, when we come to examine the relation between the Sumeric Society and the Hittite and Babylonian societies, we find no trace of the corresponding phenomenon which we should expect to find on the principle of 'the uniformity of Human Nature'.

The religion of the Babylonian World seems to have been taken over, *tel quel*, from the Sumeric dominant minority;² the religion of the Hittite World seems to have been derived from the same source in part, but in the main to have been of non-Sumeric origin—its presumable source being the Anatolian external proletariat of the Sumeric Society which flooded over the Cappadocian provinces of the Sumeric universal state when, after the death of Hammurabi, the Empire of Sumer and Akkad broke up in the nineteenth century B.C.³ The interregnum intervening between the dissolution of the Sumeric Society and the emergence of the Babylonian and Hittite societies is not spanned by any bridge which we can identify as a Sumeric proletarian church; and we cannot even point to any wreckage—a fallen key-stone or a weathered pier—which might warrant us in hazarding the conjecture that such a bridge did once exist. We know so little about the religious history of the Sumeric Society that, as we have already had to confess,⁴ we cannot confidently ascribe to a proletarian origin even those elements in the Sumeric religion—the Penitential Psalms and the worship of Tammuz and Ishtar—

¹ For the function of a universal church as a chrysalis for a new civilization see further Part VII, below.

² See I. C (i) (b), vol. i, p. 115, above.

³ See I. C (i) (b), vol. i, p. 112, with footnote 2, above.

⁴ In I. C (i) (b), vol. i, p. 115, footnote 1, above.

which assume a distinctively proletarian complexion if we allow ourselves to interpret the internal evidence in the light of a comparison with other religions which are proletarian in their origin beyond question. We can only say that, if the worship of Tammuz and Ishtar really is a monument of the experience and the creativity of the Sumeric internal proletariat, then this attempted act of creation was abortive in the history of the Sumeric Society itself, and only came to fruition in so far as it transmitted a spark of inspiration to kindle spiritual fires in alien souls.

We have already come across one of these remote workings of the worship of Tammuz and Ishtar in observing¹ how the worship of Cybele, who was the Sumeric Ishtar in a Hittite dress, became one of the 'higher religions' of the internal proletariat of the Hellenic World in the course of this goddess's long journey from the interior of Anatolia to the coasts of the Baltic and the North Sea. In this Hittite version of the worship of the Sumeric pair of divinities the figure of the goddess has dwarfed and overshadowed that of the god who plays towards her the diverse and even contradictory roles of son and lover and protégé and victim. By the side of Cybele-Ishtar, Attis-Tammuz dwindles to insignificance; and Nerthus-Ishtar seems to stand in solitary grandeur without the attendance of any masculine consort.² This north-westward road which scaled the Taurus and found its distant terminus on an island in the North European seas was not, however, the only road that was trodden triumphantly by the pair of Sumeric gods who found abroad the honour that was perhaps never wholeheartedly accorded to them in their own country. We can watch them travelling south-westwards simultaneously—down Syria into Egypt—and on this journey there seems to have been an inverse change in the relations between the two divinities—Tammuz increasing while Ishtar decreased. At any rate, the Atargatis whose worship spread from a mother-shrine at Bambyce to a daughter-shrine at Ascalon³ would appear, from her name, to have been an Ishtar whose claim to veneration was based upon her function of serving as Attis' mate; in Phoenicia an Adonis-Tammuz was 'the Lord' whose yearly death an Astarte-Ishtar mourned; and in the Egyptiac World an Osiris-Tammuz—who was associated, in the story of his Passion, with the Phoenician city of Byblus⁴—overshadowed his sister-wife Isis as decidedly

¹ See the present chapter, pp. 81-2, above.

² In the same way Isis-Ishtar, too, eventually eclipsed Osiris-Tammuz, if she did not actually dismiss him from her train, in her triumphal progress from her Egyptiac home to her Hellenic mission-field.

³ Meyer, E.: *Geschichte des Altertums*, vol. iii (Stuttgart 1901, Cotta) p. 137.

⁴ For the probable derivation of Osiris and Isis from Tammuz and Ishtar through Adonis and Astarte see I. C (ii), vol. i, p. 140, above.

as Isis, in her turn, overshadowed Osiris when she subsequently won a spiritual empire for herself in the hearts of the Hellenic internal proletariat.¹ This version of the Sumeric faith in which the suffering and dying god, and not the mourning and ministering goddess, was the figure on which the worshipper's attention and devotion were concentrated, seems even to have spread to the remote barbarians of a Scandinavian Ultima Thule, where Balder-Tammuz, like Adonis-Tammuz, was called 'the Lord' *par excellence* in the local vernacular tongue, while Balder's colourless consort Nanna still retained the personal name of the Sumeric mother-goddess.²

In the worship of Osiris the sorely oppressed proletariat of a disintegrating Egyptiac Society found a satisfying expression for a bitter resentment and an ardent hope.³ The resentment was directed against the indigenous gods of the Egyptiac World, who had allowed the dominant minority to purchase an exclusive claim on their divine benevolence with gigantic oblations—culminating in the Great Pyramids—that could only be offered at the cost of a ruthless exploitation of all but a privileged fraction of the people. From these mercenary and heartless divinities the Egyptiac internal proletariat turned away to a god who had tasted the bitterness of death and had won from this agony a strength which could make even the Pyramid-Builders tremble;⁴ and they addressed themselves to Osiris in the hope that this god of their own choice, in whom they had put their trust by a personal act of faith, would bestow upon them the immortality which their oppressors were seeking to purchase at a monstrous price from Re—the Sun-God whose character the Pharaohs had re-minted in their own image.

The resentment and the hope which were thus both expressed in a single proletarian religion were reflected, in the field of action, in that conflict between the spirit of Violence and the spirit of Gentleness with which we have become familiar in the histories of other internal proletariats. The violence discharged

¹ See p. 149, footnote 2, above.

C (ii), vol. i, pp. 140-3; for the replacement of a creative by a dominant minority in the Egyptiac World in the Age of the Pyramid-Builders see III. C (i) (d), vol. iii, pp. 212-15; for the violent proletarian revolt, during the Egyptiac 'Time of Troubles', against the idolization of the Egyptiac Double Crown see IV. C (iii) (c) 2 (β), vol. iv, pp. 409-11, above; for the proletarian origin of the Osirian Church see Breasted, J. H.: *The Development of Religion and Thought in Ancient Egypt* (London 1912, Hodder & Stoughton), pp. 37-9.

⁴ For the dread which Osiris inspired in the Pyramid Builders see *ibid.*, pp. 74-5.

itself, during the Egyptiac 'Time of Troubles', in the subversive revolutionary outbreaks of which we catch an echo in *The Admonitions of a Prophet*¹ and other works of literature in the same vein which were composed in the following age. In these orgies of savage retaliation the Egyptiac internal proletariat took a revenge upon the Pyramid-Builders which was equal in its enormity to the Egyptiac dominant minority's crying offence.

'He hath put down the mighty from their seat, and hath exalted the humble and meek;

'He hath filled the hungry with good things, and the rich he hath sent empty away.'²

But, since in this case the avenger was not a just and compassionate god but a gang of exasperated men who had taken the law into their own hands, the revenge was as barren as it was complete; and the exposure of the futility of the Pyramid-Builders' attempt to attain a selfish immortality for themselves at their subjects' expense, by a ruthless and unscrupulous exploitation of their immense material power, did not in itself reveal any alternative way of attaining the spiritual treasure which the Pharaohs had failed to win but which the proletariat had not ceased to long for. The insurgent Egyptiac internal proletariat did not succeed in quenching its spiritual thirst until it had been disillusioned and at the same time enlightened by the experience of reaping the harvest of Violence and finding that it was Dead Sea fruit. In this chastened mood it recoiled from the way of Violence to the way of Gentleness and reached, by this road, the object of its long and agonizing search. In the age of 'the Middle Empire', which was the Egyptiac universal state, we see the proletarian worshipper of Osiris finding his happiness at last in a personal relation with his god: a god whose blessed immortality was not a divine prerogative which he enjoyed *ex officio deitatis*, but was a special grace which he had won for himself—and could therefore impart gratuitously to his human votaries—in virtue of an experience which was unknown to any other god while it was the common lot of every human being. Osiris could bring salvation to Man because he—alone among the Gods—had passed through the human ordeal of Death.³

In the 'Indian Summer' of Egyptiac history this twofold mystery of Osiris' death and resurrection and of the worshipper's union with the God in his divine bliss, as well as in his tribulation,

¹ See the extracts from this poem in IV. C (iii) (c) 2 (β), vol. iv, pp. 410-11, above.

² Luke i. 52-3.

³ For Osiris as an epiphany of the Dying God see further V. C (ii) (α), vol. vi, p. 276, below.

was enshrined in a holy sepulchre and rehearsed in a passion play; and when the Egyptiac Society was *in articulo mortis* it looked as though an Osirian Church were destined to assume, for this moribund civilization, that role of executor and residuary legatee which has actually been played by the Christian Church for the Hellenic Civilization and by the Mahāyāna for the Sinic. It was only at the thirteenth hour, when the Egyptiac universal state had duly broken up and when the ensuing interregnum had set in, that the course of history was suddenly and violently diverted into an entirely different channel by the vehemence of the revulsion of the Egyptiac internal proletariat, as well as the Egyptiac dominant minority, against the alien tincture in the culture of the Hyksos barbarian invaders.¹

The historical consequences of this revulsion have engaged our attention in other contexts already² and only concern us here in their particular effect upon the fortunes of the Osirian Church. We have seen how the prospects of this church were blighted, when the flower was on the point of bearing fruit, by the establishment of an unnatural 'union sacrée' between the nascent religion of the internal proletariat and the moribund religion of the dominant minority in the mummified carcass of the Egyptiac body social. This ultimate fate of the Osirian Church was as tragic as it was inconsequent; but we must not allow an abnormal epilogue to trick us into forgetting the normality of the main action of the play. The Osirian Church had to be called into existence before it could be cheated of its manifest destiny; and, in itself, the creation of the Osirian Church is a proletarian achievement which is worthy to be compared with the creation of the Christian Church or with the creation of the Mahāyāna, while the antecedent struggle between the spirits of Violence and Gentleness in the souls of the Egyptiac internal proletariat is not less illuminating for a historian—or less moving for a fellow human being—than the similar struggle, with the similar outcome, between the gentleness of Eleazar the Scribe and Jesus of Nazareth and the violence of Judas Maccabaeus and Judas of Galilee.

The Symptoms in the Western World.

In order to complete our survey of internal proletariats we have still to examine one more case. Do the characteristic phenomena, with which we have now made ourselves familiar, reappear in

¹ See I. C (ii), vol. i, p. 139, footnote 1, and p. 144; IV. C (ii) (b) 2, vol. iv, p. 85; IV. C (iii) (c) 2 (B), vol. iv, p. 421; and Part V. A, in the present volume, pp. 2-3, above, and V. C (i) (c) 4, pp. 351-2, below.

² In I. C (ii), vol. i, pp. 144-6, and in the present Part, Division A, in the present volume, pp. 2-4, as well as in V. C (i) (b), pp. 28-9, above.

the history of the West? When we call for the evidence for the existence of a Western internal proletariat, we may find ourselves overwhelmed by an *embarras de richesses*.

We have already noticed that one of the regular sources for the recruitment of an internal proletariat has been drawn upon by our Western Society on a stupendous scale. The 'man power' of no less than ten disintegrating civilizations has been conscripted, wholesale, into the Western body social within the last four hundred years;¹ and on the common level of membership in our Western internal proletariat, to which they have thus been reduced, a process of standardization has been at work which has already blurred—or even quite effaced—the characteristic features by which these heterogeneous masses of human beings were once distinguished from one another before they were devoured and masticated by the great Leviathan of the West. Nor has the monster been content just to prey upon his own kind. Within the same four centuries he has also hunted down and swallowed up almost all the primitive societies that had not become the prey of other predatory civilizations before the beginning of the sixteenth century of the Christian Era; and, while some of the primitive populations that have been rounded up in this way into our Western internal proletariat have simply died of the shock (like the Caribs and the Bushmen and the Tasmanians and the Australian Blackfellows and the great majority of the Red Indian peoples on the North American Continent north-east of the Rio Grande),² there are others (like the Negroes of Tropical Africa) who have managed to survive and to set the Niger flowing into the Hudson.

Under the lash of our Western dominant minority (which has chastised these human rivers with more effect than ever followed from Xerxes' scourging of the insensitive waters of the Dardanelles), the Congo, too, has been made to flow into the Mississippi, and the Yangtse into the straits of Malacca; for in our modern Western World since the opening of the sixteenth century of the Christian Era—as in the Hellenic World after the opening of the third century B.C.—the populations of alien or primitive culture which have been swept into an expanding civilization's net have been not merely subjugated but also uprooted. The Negro slaves who have survived 'the Middle Passage' across the Atlantic from Africa to America, and the Tamil and Southern Chinese coolies who have been shipped to the equatorial or antipodean coasts of the Indian Ocean, are the counterparts of the slaves who,

¹ See the present chapter, pp. 89-90, above.

² For the statistical aspect of the Red Indians' fate see II. D (vii), vol. ii, p. 277, above.

in the last two centuries B.C., were consigned from all the coasts of the Mediterranean to the ranches and plantations of Roman Italy.¹

There is another contingent of conscripted aliens in our Western internal proletariat who have been uprooted and disoriented spiritually without having been physically evicted from their ancestral homes. In any community that is attempting to solve the problem of adapting its life to the rhythm of an exotic civilization to which it has been either forcibly annexed or freely converted, there is need of a special social class to serve as a human counterpart of the 'transformer' which changes an electric current from one voltage to another; and the class which is called into existence—often quite abruptly and artificially—in response to this demand has come to be known generically, from the special Russian name for it, as the *intelligentsia* (a word whose meaning is expressed in its very formation, in which a Latin root and a Western idea are acclimatized in Russian by being given a Slavonic termination). The *intelligentsia* is a class of liaison-officers who have learnt the tricks of an intrusive civilization's trade so far as may be necessary to enable their own community, through their agency, just to hold its own in a social environment in which life is ceasing to be lived in accordance with the local tradition and is coming more and more to be lived in the style that is imposed by the intrusive civilization upon the aliens who fall under its dominion.

The first recruits to this *intelligentsia* are military and naval officers who learn as much of the domineering society's art of war as may be necessary in order to save the Russia of Peter the Great from being conquered by a Western Sweden, or the Turkey and Japan of a later age from being conquered by a Russia who by this time has herself become sufficiently Westernized in the sphere of military technique to be able to launch out upon a career of aggression on her own account against her still un-Westernized neighbours. Then comes the diplomatist who learns how to conduct with Western governments the negotiations that are forced upon his community by its failure to hold its own in battle against Western armies and navies. We have seen the 'Osmanlis enlisting their *ra'iyeh* for this diplomatic work—and grudgingly allowing them the licence and influence and affluence which are the necessary reward of their services—until a further turn of the Western screw compels the 'Osmanlis at last to master for themselves this despised and distasteful trade.² Next come the merchants—the

¹ For the transplantation of Chinese coolies see II. D (vi), vol. ii, pp. 217-18, and II. D (vii), vol. ii, p. 315; for the transplantation of Negro slaves see II. D (vi), vol. ii, pp. 218-20, above.

² See II. D (vi), vol. ii, pp. 224-8, and Part III. A, vol. iii, pp. 47-50.

Hong Merchants at Canton;¹ the compradores of a later generation at Shanghai; the Levantine,² Sephardi,³ Greek,⁴ and Armenian⁵ subjects of the Ottoman Pādishāh in the Échelles du Levant—who manage to hold the long spoons with which any self-respecting non-Western society prefers at first to sup when it is shamefacedly doing commercial business with the Western devils. And finally, as the leaven—or virus—of Western Civilization works deeper into the social life of the society which is in process of being penetrated and assimilated, the intelligentsia develops its most characteristic types: the schoolmaster who has learnt the trick of teaching Western subjects; the civil servant who has picked up the practice of conducting the public administration according to Western forms; the lawyer who has acquired the knack of applying a version of the *Code Napoléon* in accordance with a nineteenth-century French judicial procedure.

This spectacle of the creation of an intelligentsia will occupy our attention again at a later stage when we are studying,⁶ for its own sake, the phenomenon of the contacts between civilizations. In this place we merely have to observe that, wherever we find an intelligentsia in existence, we may infer, not only that two civilizations have been in contact, but that one of the two is now in process of being absorbed into the other's internal proletariat. We can also observe another fact in the life of an intelligentsia which is written large upon its countenance for all to read: an intelligentsia is born to be unhappy.

This liaison-class suffers from the congenital unhappiness of the bastard and the hybrid, who is an outcast from both the families—or a sport in both the races—that have guiltily combined to beget him. An intelligentsia is hated and despised by its own people because its very existence is a reproach to them. Through its awkward presence in their midst it is a living reminder of the hateful but inescapable alien civilization which cannot be kept at bay and which therefore has to be humoured. The Pharisee is reminded of this each time when he meets the Publican, and the Zealot when he meets the Herodian. The intelligentsia's unpardonable offence in the eyes of its own kith and kin is the very indispensability of the social services which the intelligentsia performs—a hard fact which the Pharisees never overtly acknowledge yet perpetually recognize and resent in their hearts. And, while the intelligentsia thus has no love lost upon it at home, it also has no honour

⁶ In Part IX, below.

paid to it in the country whose manners and customs and tricks and turns it has so laboriously and ingeniously mastered. In the earlier days of the historic association between India and England a Hindu intelligentsia which the British Rāj had fostered for its own administrative convenience was sometimes ridiculed by English philistines who dishonoured their own nation in insulting their Indian fellow subjects. The more facile 'the babu's' command of English, the more sardonically 'the sahib' would laugh at the subtle incongruity of those minute errors that still inevitably crept in.¹ The philistine perhaps seldom paused to reflect that his own knowledge of Hindustani was far too imperfect to expose him to the same kind of ridicule vice versa, and he did not ask himself whether his depreciation might not be a left-handed kind of praise and his scorn a mask for an unconfessed envy of a virtuosity which the dominant alien was perhaps affecting to despise because he himself lacked either the skill or the application to attain to it. The philistine simply gave rein to his feelings; and, however captious his criticism might be, the shaft of malice would only too often strike home.

The intelligentsia is at the philistine's mercy because the essence of the intelligentsia's profession is, after all, mimesis; its art consists in a *tour de force*; and in other contexts we have already probed the weak points of mimesis and assessed the penalty that has to be paid for making the audacious attempt to add a cubit to one's stature. The insipid mechanicalness of mimesis,² and the pathological distortion and abandoned vulgarity that are apt to result from the division of labour and the practice of mimesis in a society in process of civilization,³ are vices which find a uniquely congenial soil to grow in on the border-line of contact and fusion between one disintegrating civilization and another; and this means that the intelligentsia is exposed to the danger of being infected with these moral maladies *ex officio*. In these circumstances the taunts with which the intelligentsia is assailed by its critics are likely to hit the mark—even though the missile may recoil, like a boomerang, upon the heads of the critics themselves when they do not hesitate to make use, for their own profit, of those valuable social services through the faithful performance of which the intelligentsia acquires its characteristic faults.

It will be seen that the intelligentsia complies in double measure

¹ The present writer can enter personally into the feelings of the Anglophone Hindu through having been brought up to express his own feelings in Greek elegiac verse. He can imagine what game would be made of the verses printed at the beginning of volume i of this Study if an Antipater of Sidon or a Meleager of Gadara were to cast his eye over them in a malicious mood.

² See IV. C (iii) (a), vol. iv, pp. 119-33, above.

³ See IV. C (iii) (b) 14 and 15, vol. iv, pp. 232-45, above.

with our fundamental definition of a proletariat¹ by being 'in' but not 'of' two societies and not merely one;² and while it may console itself in the first chapter of its history with the ironical reflection that it is an indispensable organ of both these bodies social, and that this very indispensability is the head and front of its offending, it is robbed of even this consolation as time goes on. For the adjustment of supply to demand is almost beyond the wit of Man when 'man-power' itself is the commodity; and, just because an intelligentsia is an emergency-product which has to be called into existence rather suddenly and artificially *ex nihilo* in the first instance, the measures taken to stimulate production are apt to lead to over-production in the end.

A Peter the Great wants so many Russian chinovniks or an East India Company so many Bengali clerks or a Mehmed 'Ali so many Egyptian mill-hands and shipwrights: incontinently they set to work to perform their conjuring-trick of creating something out of nothing with all the vigour and resourcefulness of the consummate man of action which the successful Westernizer has to be; and then, in the next chapter of the story, they find themselves in the quandary of the hero in the fairy-tale who has learnt the magic formula for making the mill grind salt but has forgotten to acquaint himself with the complementary formula for stopping the machinery when the mill has ground out all the salt that the magician requires. The process of manufacturing an intelligentsia is still more difficult to stop than it is to start; for the contempt in which the liaison-class is apt to be held by those who profit by its services is more than offset by its prestige in the eyes of those who are eligible for enrolment in it; and the competition becomes so keen that the number of the candidates rapidly increases out of all proportion to the number of opportunities for employing them. When this stage is reached, the original nucleus of an intelligentsia which is consoled by being employed becomes swamped by the adventitious mass of an 'intellectual proletariat' which is idle and destitute as well as outcast. The handful of chinovniks is reinforced by a legion of 'Nihilists', the handful of babus who thankfully drive their quills, or resignedly tap their typewriters, by a legion of 'failed B.A.s'. And the bitterness of the intelligentsia is incomparably greater in this latter state than it is in the former.

¹ In I. B (iv), vol. i, p. 41, footnote 3, above.

² This painful insulation is particularly in evidence in the history of the Russian intelligentsia during the century ending in the Bolshevik revolution of 1917:

'From the first, the revolution, whether theoretical or political, had no base of support among the masses. . . . The revolutionary circle had a world of its own, and formed a state within the state.'—Masaryk, T. G.: *The Spirit of Russia* (English translation: London 1919, Allen & Unwin, 2 vols.), vol. ii, p. 106. The whole chapter (pp. 105-114) from which this quotation is taken is illuminating.

Indeed, we might almost formulate a social 'law' to the effect that an intelligentsia's congenital unhappiness regularly increases in acuteness in geometrical ratio with the arithmetical progress of time. The Russian intelligentsia, which dates from the close of the seventeenth century, has already discharged its accumulated spite in the shattering Bolshevik Revolution of A.D. 1917. The Bengali intelligentsia, which dates from the latter part of the eighteenth century, is displaying to-day a vein of revolutionary violence which is not yet to be seen in other parts of British India,¹ where the local intelligentsia did not come into existence till fifty or a hundred years later. In Egypt and Java and China and Japan, where the intelligentsia is of about the same age as it is in Gujerat or in the Panjab, it is also in about the same mild state of exasperation to-day; but in Java and Japan, at any rate, the latest symptoms seem to portend the approach of paroxysms of a Russian or Bengali fury.²

Nor is the rank growth of this social weed confined to the soil in which it is a native plant. While, in our latter-day Westernized World, the intelligentsia has made its first appearance on non-

¹ For this contrast see the present chapter, p. 106, above.

² The symptoms of unrest in the 'intellectual proletariat' of Japan thrust themselves upon the attention of the writer of this Study during a visit to the Far East in the autumn of 1929. The Japanese Government's extreme nervousness about 'dangerous thought' was exhibited to the traveller when, upon landing in Japan, he was required, as part of the regular passport and customs procedure, to make a complete return of any books and pamphlets that might be included in his luggage. Evidently the Japanese authorities believed that some important element in the population was particularly prone to catch the mental infection of foreign subversive ideas; and, equally evidently, they were terrified about the possible consequences of the disease if once it did gain a hold upon the Japanese body social. Some of the grounds for this anxiety on the Japanese dominant minority's part were soon revealed to the writer when, in the university town of Kyoto, he was informed that, out of the last graduation-class of students, only 20 per cent. of the young men and women had succeeded in finding employment. Since a majority of the students were the children of poor parents—mostly workers on the land—and had been given their university education (which incidentally unfitted them for pursuing their ancestral calling) at the cost of heavy sacrifices and privations on their family's part, the failure of their education to bring in any economic return was nothing less than a social disaster. The unemployed ex-student was thrown back, without prospects, to live upon his family in an over-populated and insolvent countryside, and he was embittered by a humiliating sense of failure and frustration, while his relatives were equally embittered by a feeling that all their sacrifices had been in vain. Here indeed was food for 'dangerous thought' to feed on! Finally, on his way home to Europe from the Far East via Siberia, the writer was taught to admire the enterprise and courage of this Japanese 'intellectual proletariat', in its desperate straits, by hearing the personal story of a Japanese girl who was travelling in the same train. Having studied and qualified for being a school-mistress, and having then realized how poor her prospects were in a profession that was already so terribly overcrowded, she was spending her small savings on the venture of taking a year's course in dressmaking at Paris, on the calculation that within the next few years there would be a demand in Japan for *modistes à l'occidentale* owing to the growing tendency for Japanese women to follow the men's example in adopting Western dress. It seemed only too likely that if this admirable Japanese initiative and fortitude in the face of adversity were cheated, by circumstances beyond its control, of its morally due reward, it would find vent sooner or later in a violent explosion. These trivial experiences of the writer in the autumn of 1929 cast a flood of light, for him, upon the Japanese outbreak which duly occurred, two years later, in the autumn of 1931. In the militant policy which the Japanese Empire has been pursuing since then, the driving force has been the revolutionary passion of the young naval and military officers and the rejected cadets; and these are typical members of the Japanese intelligentsia.

Western ground that has been in process of being annexed to the domain of an expanding Western Civilization, it has latterly begun to spread to the homelands of the aggressive society. A lower middle class which has received a secondary and even a university education without being given any corresponding outlet for its trained abilities is the backbone of the post-war Fascist Party in Italy and National-Socialist Party in Germany; and the demoniac 'driving-force' which has carried a Mussolini and a Hitler to the pinnacle of power has been generated out of this 'intellectual proletariat's' exasperation at finding that its painful efforts at self-improvement are not sufficient in themselves to save it from being crushed between the upper millstone of a politically organized Capital and the lower millstone of a politically organized Labour. In Fascist Italy and National-Socialist Germany we can thus identify some of the symptoms that have notoriously accompanied the production of an 'intellectual proletariat' in a half-Westernized Japan or Java or Bengal or Russia. But Italy and Germany are no alien appendages to the Western body social; they are bone of its bone and flesh of its flesh; and it follows that the social revolution which has taken place yesterday in Italy and Germany under our eyes may overtake us in France or England or the Netherlands or Scandinavia to-morrow.

As a matter of fact, we do not have to await our present Post-War Age in order to see a Western internal proletariat being recruited from the native tissues of the Western body social; for in the Western, as in the Hellenic, World it is not only the subjugated primitive and alien populations that have been torn up by the roots. In Western Christendom, as in Hellas, the original nucleus of an ever growing internal proletariat has been formed out of *déracinés* who were born and bred in the bosom of the disintegrating society before they were disinherited and driven into exile by the winnowing fan of civil strife which so perversely scatters the grain and leaves the chaff lying on the threshing-floor.¹ As early as the second chapter of our Western history—in the so-called 'Medieval' Age which runs from the last quarter of the eleventh to the last quarter of the fifteenth century of our era—we can see this scourge afflicting the Italian cosmos of city-states; and the figure of Dante stands at the head of the long line of Western exiles, as Thucydides heads the parallel line

¹ For the inverse social selection which is one of the penalties of *stasis* see Seeck, O.: 'Die Ausrottung der Besten' in his *Geschichte des Unterganges der Antiken Welt*, 4th edition (Stuttgart 1921, Metzler, 6 vols., with supplements), vol. 1, part (2), chap. 2. (This chapter of Seeck's work has been cited already in IV. C (ii) (b) 1, vol. iv, p. 63, footnote 1, above.)

in the history of the decline and fall of Hellas.¹ In our Western history, however, this social malady of exile, as the penalty for being left upon the losing side in civil dissensions, did not become rife throughout the Western World until after the Italianization of the Transalpine and Transmarine countries of Western Christendom at the opening of the 'Modern' Age;² and in the West in this age a personal and political hatred of the kind that animated the Florentine and Roman and Athenian faction-feuds has been envenomed with an *odium theologicum*.

The sixteenth-century and seventeenth-century Wars of Religion³ brought in their train the penalization or eviction of the discomfited Catholic faction in every country where the sovereign power fell into Protestant hands, and of the discomfited Protestant faction in every country where a Catholic Government succeeded in maintaining itself; and the odious rule '*Cuius Regio eius Religio*',⁴ which was accepted by Catholics and Protestants alike in their common idolization of the fetish of absolute sovereignty in a parochial state, has left its mark down to this day—on a world which has long since forgotten the Catholic-Protestant quarrel—in the dispersion of the descendants of French Protestant exiles who are scattered over the face of the Earth from Prussia to South Africa and the descendants of Irish Catholic exiles who are scattered, even more widely, from Chile to Austria and from the United States to Australia. Nor has the plague been stayed by the peace of lassitude and cynicism in which our Western Wars of Religion tardily came to their close.⁵ For the fanaticism which seemed to have burnt itself out before the opening of the eighteenth century had lighted up again, before that century came to an end, in a new and larger and still more inflammable pile of fuel. In another context we have observed how the Wars of Religion have been followed, after the briefest respite, by the Wars of Nationality;⁶ and in our modern Western World the spirit of religious fanaticism and the spirit of national fanaticism are manifestly one and the same evil passion masquerading under a superficial diversity of interest and objective.

Our modern Western nationalism has an ecclesiastical tinge; for, while in one aspect it is a reversion to the idolatrous self-

worship of the tribe¹ which was the only religion known to Man before the first of the 'higher religions' was discovered by an oppressed internal proletariat,² this Western neo-tribalism is a tribalism with a difference. The primitive religion has been deformed into an enormity through being power-driven with a misapplied Christian driving-force. The Golden Calf—or Lion or Bear or Eagle, or whatever the tribal totem may happen to be—is being worshipped in our world to-day with an intensity of feeling and a singleness of mind which ought not to be directed by human souls towards any god but God Himself.³ And it is not surprising to find that we have been propitiating these blasphemously idolized tribal deities with the human sacrifices which they relish and exact. How should we do otherwise when our Protestant and Catholic forefathers have set us the example by making the same impious oblations to a God whose delight is in mercy and not in Man's cruelty to Man? Thus we see the eviction of the Protestants from France in A.D. 1685 and from Salzburg in A.D. 1731-2 being followed in A.D. 1755 by the eviction of the Acadians from Nova Scotia (a name which tells its own tale of national rivalry) and in A.D. 1783 by the eviction of 'the United Empire Loyalists' from the new-born United States;⁴ and these are the vanguard of a fresh host of exiles—the French aristocratic *émigrés* of 1789; the European liberal *émigrés* of 1848; the Russian 'White' *émigrés* of 1917; the Italian and German democratic *émigrés* of 1922 and 1933; the Austrian Catholic and Jewish *émigrés* of 1938—who have been uprooted in the effort to impose a spiritual uniformity by force: an ideal which loses none of its perversity—though assuredly most of its excuse—for being transferred to the national from the ecclesiastical arena.

To these victims of a politico-religious fanaticism we have to add the tale of exiles who have been carried into captivity from the centre to the fringes of an expanding Western World as a punishment for crimes (some serious, some trivial; some real, some imaginary), and, in particular, the convicts who have been transported from the British Isles to North America before, and to Australia since, the establishment of the independence of the United States. These British convict-exiles to the New World overseas are the counterparts of the criminals whom the Sinic Emperor Ts'in She Hwang-ti planted in the newly conquered barbarian territories of the south,⁵ and of the *déracinés* whom

the Achaemenidae marooned on the islands of the Red Sea.¹ There are also counterparts, in our modern Western internal proletariat, of that floating urban population—irretrievably divorced from the country-side yet never properly acclimatized to the life of the city—which we see silting up in Rome and in the smaller towns of Sicily and Italy in the last two centuries B.C. Indeed, in our own world this element in the proletariat has come to occupy so prominent a place, and to weigh so heavily upon the consciences of statesmen as well as philanthropists, that when we pronounce the word ‘proletariat’ it is this element, to the exclusion of all the rest, that is apt to present itself to our minds.

We have seen how in Sicily and Italy, during the Hellenic ‘Time of Troubles’, the free population was uprooted from the country-side and driven into the towns by an economic revolution in the conduct of the rural industries of agriculture and stock-breeding. The new rural economy was the offspring of War, which presented the *entrepreneur* with the *tabula rasa* of a devastated area and with the edged tool of the cheap labour-force which the enslavement of the prisoners-of-war had thrown upon the market. By placing these two instruments simultaneously in the *entrepreneur*’s hands, War taught him the secret of drawing an unprecedented and almost fabulous profit from the land by a new-fangled process of mass-production for export.² The uprooting and eviction of the free peasant proprietor who had formerly supported himself by subsistence farming on the site of the new plantations and ranches was an incidental consequence of the rural economic revolution which War and the *entrepreneur* had brought about between them. And, when the disinherited peasant was first reduced to the status of a seasonal wage-labourer on the land and was eventually shouldered off the land altogether and penned up in a slum inside the walls of the city, nobody imagined or pretended that there was anything but unmitigated evil in this degradation of a self-supporting peasant into an unemployed town-dweller whose life was just kept in his body by the grudging distribution of a public dole. The capitalist who was making his fortune out of a slave-tilled country-side displayed as ugly a countenance as his patron-god Mars himself; and, for any disinterested spectator of the joint work of this grim pair of partners, it was not surprising to find wickedness producing results which were morally repugnant and socially disastrous.

¹ See the present chapter, p. 124, footnote 2, above.

² For this rural economic revolution in the western parts of the Hellenic World in and after the fifth century B.C. see III. C (i) (b), vol. iii, pp. 168–71, and IV. C (ii) (a), vol. iv, pp. 48–9, above.

In our modern Western history we have seen an almost exact repetition of this Hellenic social disaster in the rural economic revolution which made it irresistibly profitable to substitute cotton plantations worked with Negro slaves for the mixed farming of White freemen in 'the Cotton Belt' of the Southern States of the American Union in the earlier decades of the nineteenth century.¹ The 'White trash' which was thus degraded to the ranks of the Proletariat in this Transatlantic annex of the modern Western World was of the same quality as the dispossessed and pauperized 'free trash' of Roman Italy who were 'called the lords of the World' without having 'a single clod of earth to call their own';² and this rural economic revolution in North America which produced these two cancerous social growths of White pauperdom and Black slave-labour was only a logically ruthless application, in an overseas environment, of a similar rural economic revolution in England which had been taking place more gradually in the course of the preceding three centuries. The English *entrepreneurs* of the early Modern Age had not followed the bad example of the Portuguese in introducing African slave-labour into a European country-side, but they had imitated the Roman and anticipated the American planters and stockbreeders in uprooting a free peasantry for the sake of economic profit, by turning ploughland into pasture and common-land into enclosures. This modern Western rural economic revolution has not, however, either in Europe or overseas, been the principal cause of the flow of population from the country-side into the towns in the Modern Age of our Western history. The motive-force that has been mainly operative in bringing about this movement on a material scale which dwarfs the Hellenic counterpart of it has been not a push but a pull. While the *ci-devant* self-supporting rural population of the Western World has partly been driven into the towns by a rural agricultural revolution which has deprived it of its former livelihood on the land, it has mostly been drawn into the towns by an urban industrial revolution which has inveigled it into tearing up its own roots by dangling before its dazzled eyes the lure of abundant urban employment at lucrative wages.

When this Western Industrial Revolution broke out first on English ground about a hundred and fifty years ago, its economic profitableness appeared to be so immense and so secure that the great change was welcomed and blessed—social consequences and all—by many observers who were not less well-meaning than a

¹ See III. C (ii) (b), vol. iii, pp. 171-2, and IV. C (iii) (b) 2, vol. i v, pp. 139-40, above.

² Tiberius Gracchus, quoted in the present chapter on p. 70, above (see also IV. C (iii) (c) 3 (β), vol. iv, p. 508, above, and V. C (ii) (a), Annex II, vol. vi, p. 381, with Table VIII, legion (α), p. 414, below).

Spartan Agis or a Roman Tiberius Gracchus. While deploring the long hours of labour to which the first generation of factory workers, including the women and children, were condemned, and the sordid and unhealthy conditions of their new life in both the factory and the home, the panegyrists of the Industrial Revolution were confident that these were transitory evils which could and would be removed, and they denounced, as an improvident folly, any proposal to check the impetus of Man's crowning victory over Physical Nature for the sake of sparing Society the inevitable growing-pains. If only (they urged) the Industrial Revolution were allowed to work itself out unhindered, the total wealth of Society would be so vastly increased that the workers themselves could not fail to obtain a handsome share of this well-earned increment; and, when once the spoils of Man's conquest of Nature had been gathered in and divided out, then the temporary inconveniences with which the first and second generation of urban industrial workers had been required to put up would be compensated a hundred-fold by the solid comfort in which the third and fourth and subsequent generations would live happily ever after.

The ironical sequel has been that this rosy prophecy has largely come true—in defiance of the gloomy forebodings of the nineteenth-century prophets of woe—but that the blessings of this marvellous entry into an earthly paradise 'in real life' are being neutralized to-day by a curse which was hidden from the eyes of the pessimists, as well as the optimists, of a century ago. On the one hand, child labour has been abolished, women's labour has been tempered to women's strength, hours of labour have been shortened, the conditions of life and work in factory and home have been improved out of all recognition, and at the same time the workers' share in the spoils won from Nature by Industry has been substantially increased—as is shown by the steady proportionate increase of the wages bill by comparison with the profits in the employers' balance-sheet. In all these ways the urban industrial workers' position has improved beyond the most sanguine expectations of the enthusiasts for the Industrial Revolution in the generation of its outbreak. But there is another side to the shield; and this aspect daunts even our optimists to-day when a world that is gorged with the wealth ground out by the magic industrial machine is at the same time overshadowed by the spectre of unemployment. *À la fin du compte* the transfer of population from country-side to town has produced the same cancer in the Western as in the Hellenic body social: the cancer of an urban proletariat which has lost its roots in the country, has struck no roots in the town, and is reminded—every time that it draws its

dole—that it is 'in' but not 'of' the society which has to serve as the unwilling 'host' of this unhappy social parasite.

Through the ingenuity of Industrialism the modern Western World has evaded the curse of Adam—'in the sweat of thy face shalt thou eat bread'¹—which has weighed hitherto upon the life of every human society that has started, from the primitive level, to clamber up the face of the precipice of Civilization.² We have slily transferred the primal curse from our own muscle and bone to the immeasurably more potent material forces of Inanimate Nature; and now we find ourselves trapped by the very brilliance of the success of our technological manœuvre; for our new-found economic abundance has taken us morally unawares. Morally we have allowed ourselves no time to revise the dispensation under which we and our forefathers have been living during six thousand years of Adamic scarcity—a dispensation which prescribes that we shall work 'with labour and travail night and day that we' may 'not be chargeable to any of' our neighbours, and which commands 'that if any' will 'not work, neither' shall 'he eat'.³ And now that an unmanageable abundance has made nonsense of the precept that 'with quietness they work, and eat their own bread',⁴ we find ourselves morally at a loss in our relations with the millions that 'walk among' us 'working not at all'⁵ to-day through no fault of their own. Manifestly these helpless human victims of callously triumphant machines are not the 'disorderly busybodies'⁶ which they would have been if they had been work-shy idlers in the aeon of scarcity; for a 'technological' unemployment cannot be exorcised by an honest will to work. Yet still it cannot be incurred without bringing upon its victims those moral pains and penalties—the sense of frustration and the consciousness of losing caste—which were the proper and inevitable retribution for a wilful work-shy idleness but are a cruel aggravation of an unavoidable lock-out.

This revenge of Nature upon her Western conquerors has been hastened and sharpened by the triumph of an industrialized Western Society over the human as well as over the physical environment. Since the outbreak of the Industrial Revolution in the eighteenth century in England, we have not only completed our industrial conquest of Nature in Western Europe. We have also taught the tricks of our West European trade to the new communities of Western culture which have been established by our West European colonists overseas, and to the old communities of alien culture which have been forcibly enrolled in the Western

⁶ Op. cit., loc. cit.

internal proletariat. The sleight of hand which replaced the poorly remunerated hard labour of human and bovine and equine muscles by the fabulously productive facile labour of iron and coal and steam and oil and electricity has been applied in the cities—and even on the fields—of America and Russia and India and China and Japan, as well as in those of England and Belgium and France and Germany; and, with the physical plethora of plenty, the spiritual curse of plenty—the curse of an unavoidable yet intolerable unemployment—is now spreading from the European metropolis of our latter-day Great Society to its American and Asiatic provinces. We may even live to see the cancer fasten upon the heart of Tropical Africa, where in the post-war years the latest and most primitive of the alien recruits to our Western internal proletariat have been flung into the furnace of Industrialism by the discovery of the copper ores of Northern Rhodesia and Katanga—a discovery which has led the African's latter-day European masters to provide themselves with a Native industrial 'labour-force' by deliberately driving the African out of the kraal into the labour-market through the imposition of poll-taxes and hut-taxes at a rate at which they cannot be paid out of the produce of African subsistence-farming.

In other words,

The ground of a certain rich man brought forth plentifully, and he thought within himself, saying: 'What shall I do, because I have no room where to bestow my fruits?' And he said: 'This will I do: I will pull down my barns and build greater; and there will I bestow all my fruits and my goods. And I will say to my soul: *Soul, thou hast much goods laid up for many years. Take thine ease, eat, drink and be merry.*' But God said unto him: 'Thou fool, this night thy soul shall be required of thee: then whose shall those things be which thou hast provided?' So is he that layeth up treasure for himself and is not rich toward God.¹

If the souls of a modern Western dominant minority have indeed now been summoned to appear before God's judgement-seat, their intelligences must be inquiring, with an anxious curiosity, into the temper of that vast Western internal proletariat whose membership we have cursorily reviewed from the earliest victims of a political revolution in a medieval Italian city-state to the latest victims of the industrial revolution in the primitive kraals of Central Africa. Do we find the two veins of Violence and Gentleness reappearing in our Western internal proletariat's reaction to the proletarian ordeal? And, if both the two alternative tempers are displayed, which one of the two is in the ascendant?

¹ Luke xii. 16-21.

Manifestations of the militant temper in our Western under-world are not far to seek. We can find them in every secret conspiracy or open insurrection of down-trodden social classes and religious or national minorities during the last four centuries: in the revolt of the High German peasantry against their feudal lords in 1524-5; in the seizure of the Low German city of Münster¹ by a band of Anabaptist 'Zealots' who converted a medieval prince-bishopric into a communistic New Jerusalem and successfully defied a world in arms for seventeen months in 1534-5;² in the French revolutions of 1789 and 1830 and 1848 and 1871; in the Russian revolutions of 1905 and 1917; in the Bavarian and Hungarian 'Red' revolutions which followed the defeat of the Central Powers in the General War of 1914-18; and in the Haitian revolution of 1795-1803, in which a modern Western band of plantation-slaves wrested an enduring success out of that desperate enterprise of exterminating their masters and establishing a freedmen's state which had proved to be beyond the powers of the Zanj slave-insurgents in 'Irāq in the ninth century of the Christian Era³ and the Syrian slave-insurgents in Sicily in the second century B.C.⁴ The wreckage left behind by these explosions of Violence litters the track of our Western Society's recent history; but, when we turn to look for corresponding evidence of a counteracting and constructive spirit of Gentleness, the traces of this hitherto are, unhappily, far to seek.

¹ The revolutionary establishment of an Anabaptist commonwealth at Münster in 1534 was not a unique or unprecedented event. In 1528 a band of Anabaptist Tyrolese peasants had similarly seized and momentarily held the city of Brixen, and, after the collapse of the Anabaptist commune at Münster, there were a number of abortive Anabaptist 'putsches' in the Netherlands.

² The original stimuli and aims of the insurgent peasants and the Anabaptists were not the same, though in the course of their revolt the peasants came under revolutionary religious influences. The peasants were moved to rise against their lords by a recent increase in the weight of their feudal burdens (partly owing to the reception of Roman Law in place of local custom), by an abuse of money-lending, and by the growth of a rural landless proletariat in the south-western and central parts of Germany through which the revolt spread. The substance of the peasants' demand was a reduction of their burdens to the customary amounts and, as far as this essentially conservative programme came to be tinged with more radical ideas, these were more akin to the French ideas of 1789 than to the Russian ideas of 1917 (see Schubert, H. von: *Der Kommunismus der Wiedertäufer in Münster und seine Quellen* (Heidelberg 1919, Winter), p. 9; Schönebaum, H.: *Kommunismus im Reformationszeitalter* (Bonn and Leipzig 1919, Schroeder), p. 27). On the other hand, Anabaptism was an urban movement which was led into communism by considerations that were not economic but religious (see Schubert, op. cit., pp. 7-9 and *passim*; Schönebaum, op. cit., pp. 24 and 41; Carew Hunt, R. N.: 'Some Communist Experiments of the Sixteenth Century' in *The Edinburgh Review*, No. 504, vol. 247, April 1928, p. 285). The revolutionary-minded townspeople sympathized, however, with the rural insurgents and infected them with their ideas. The Swabian peasantry were influenced by Anabaptist secessionists from the Zwinglian Church at Zürich (Schönebaum, op. cit., pp. 30-1), the Franconian and Thuringian peasantry by Thomas Müntzer, one of the 'prophets of Zwickau' who had seceded from the Lutheran Church at Wittenberg (op. cit., p. 25), and who lost his life at the battle of Frankenhausen, at which the tide of war turned, on the 25th May, 1525, against the peasants and in favour of the feudal lords (see Carew Hunt, R. N., in *The Church Quarterly Review* for July 1938 and January 1939).

³ See the present chapter, p. 129, footnote 2, above.

⁴ See the present chapter, pp. 69-70, above.

It is true that we can point to many victims of the cruel process of disinheritance and eviction who have refrained from taking to violent courses. In another context¹ we have passed in review several examples of refugees from religious or political persecution in the European homelands of our Western Civilization whose response to the challenge of having their roots plucked up has been to strike fresh root in virgin soil overseas. Many—perhaps a majority—of the Protestants who were expelled from France and the Catholics whose native Ireland under a Protestant ascendancy became too hot to hold them and the Loyalists who had to leave their homes in the former Thirteen Colonies in 1783 and the Liberals who had to flee from Germany in 1848 have made fortunes and founded families in the overseas countries of their adoption—in South Africa or Chile or Australia or Canada or the United States or whatever the country may be. The same *tour de force* has been achieved by the American and Australian descendants of many English indentured servants and deported convicts. Even the liberated descendants of the Negro slaves in the United States and the Antilles (to leave out of account the victorious rebels in Haiti) have not entirely failed to find a second home in the house of exile. In 'the Black Belt' of the New World to-day there are Negro populations to be found who have settled down as self-supporting peasants on a land in whose features they can recognize the kindly Mother Goddess that nurtured their forebears in Africa before they were torn from her bosom by the slave-raider's sacrilegious hand. But these successful responses to the stimulus of penalization—admirable though they may be in themselves—are none of them examples of the gentle response to the ordeal of serving in the ranks of the Internal Proletariat; for these diverse ways of meeting and conquering adversity all agree in one point: they are all of them ways of refusing to join the Proletariat—or at any rate refusing to remain in it. They are solutions of the proletarian's problem which avoid the necessity of choosing between the violent and the gentle alternative courses by finding ways and means of escaping altogether from the dilemma. In our search for modern Western exponents of the gentle response our only finds will be the German Anabaptist refugee settlers in Moravia and the Dutch Anabaptist Mennonites and the members of the English Society of Friends; and even these three rare specimens of a gentle proletarian *éthos* will slip through our fingers; for, when we follow up their later history, we shall find that, in the end, the Moravian Anabaptists and the Mennonites and the Quakers have each been re-absorbed, in their turn, into the general Western body social.

¹ In II. D (vi), vol. ii, above.

The failure of the Moravian Anabaptists and the Mennonites to preserve their separate communal life is the more extraordinary considering that a secession from the Western Church Universal was the essence of the Anabaptist movement and the significance of the symbolic act of re-baptism from which the movement acquired its name.¹ The problem of asserting this separateness in face of a hostile and intolerant majority of the society from which they were deliberately and defiantly seceding confronted all Anabaptists in virtue of the cardinal point in their creed; and the pacifist

¹ For a general account of the Anabaptist movement see McGothlin, W. J. M., s.v. 'Anabaptism', in Hastings' *Encyclopaedia of Religion and Ethics*. An interesting sketch, in small compass, will also be found in Piette, M.: *John Wesley in the Evolution of Protestantism* (English translation: London 1937, Sheed and Ward), pp. 18-36. The Anabaptists welcomed the destructive part of Luther's work, but disapproved of his endeavour to construct a new Church Universal on the ruins of the Church of Rome (Müller, L.: *Der Kommunismus der Mährischen Wiedertäufer* (Leipzig 1927, Heinsius), pp. 65-6). They quarrelled with Zwingli likewise for his unwillingness to fall in with their view that the elect ought to be separated off from the rest of Mankind (op. cit., p. 68). The Anabaptist sect may be said to have come into existence when the first re-baptism was performed at Zollikon near Zürich in February 1525 (Müller, op. cit., p. 69; Carew Hunt, op. cit., pp. 277-8; Schönebaum, op. cit., pp. 29-31). In its essence the Anabaptist movement was thus a recrudescence of the movement for the establishment of a separate church of the elect which had declared itself once before in Western Christendom in the twelfth-century vogue of Catharism and other kindred sects (for this affiliation of the Anabaptist movement see Müller, op. cit., p. 65; for Catharism see IV. C (iii) (c) 2 (β), vol. iv, pp. 369-71; IV. C (iii) (c) 3 (β), vol. iv, pp. 559-60; IV. C (iii) (c) 2 (β), Annex III, vol. iv, pp. 624-34; IV. C (iii) (c) 3 (β), Annex, vol. iv, pp. 652-6, above).

The following note has been communicated to the writer of this Study by Mr. R. N. Carew Hunt:

'The essential characteristic of Anabaptism is the demand that the Church should be a *Sonderkirche*: that is, that it should consist of believers only, who, after attesting their faith, should be admitted to membership through "believers' baptism". . . . But "believers' baptism", however important, is subordinated in their thought to the *Sonderkirche* idea and to the necessity for a return to Primitive Christianity. Baptism was the means, the *Sonderkirche* the end.

'The movement started in Germany and Switzerland in 1523-4. In Germany the principal exponent was Thomas Müntzer, who had been influenced, through Niclas Storch at Prague, by Taborite opinions, and himself visited Bohemia in 1522-3 [see Mr. Carew Hunt's articles in *The Church Quarterly Review*, cited on p. 167, footnote 2, above.—A.J.T.]. Müntzer was not a thoroughgoing Anabaptist. . . . But he preached, and no one more vehemently, the Anabaptist doctrine of a Church of the Elect, though he did not regard "believers' baptism" as the divinely appointed means of entering it. In his writings and letters he taught, further, that it was for the Elect to arise and slay the godless, and he thus represents the militant spirit which was to come out in the Münster revolt.

'Meanwhile there had arisen in Switzerland a movement against Zwingli of which Conrad Grebel and Felix Manz were the most important leaders. As early as 1523 they began to pester Zwingli to set up a Church of the Elect into which the faithful should be baptized (see Egli, E.: *Die Zürcher Wiedertäufer zur Reformationszeit* (Zürich 1878, Schulthess), pp. 10 seqq.; Kidd, B. J.: *Documents Illustrative of the Continental Reformation* (Oxford 1911, Clarendon Press), pp. 450-8). . . . On the 18th January, 1525, the Council of Zürich ordered infant baptism, and the Opposition set up a church at Zollikon, where, on the 9th February, Grebel baptized Blaurock. From this action Anabaptism, as a sect, technically dates.

'In both German and Swiss Anabaptist circles there was a good deal of talk of communism before 1525; but none of the leaders advanced any clearly defined policy of social reform, and their insistence on communism was no more than a part of their general demand for the establishment of a church modelled on that of the early Christians, whose members had possessed all their goods in common. But the Swiss Anabaptists from the first disallowed the use of force against the ungodly, which Müntzer advocated, and the letter which Grebel, Manz and others addressed to him on the 5th September, 1524, shows the measure of their disagreement.'

communities in the Netherlands and Moravia, as well as the militant messianic commonwealths at Brixen and Münster,¹ were attempts to respond to this formidable challenge. The social pressure to which the Anabaptists were reacting was so heavy that in their violent and in their gentle reaction alike they were driven to extremes.

The violent reaction at Münster (*saeveibat* 9th February, 1534, to 25th June, 1535)² was in an apocalyptic vein.³ An Anabaptist prophet, Melchior Hofmann, whose head-quarters were at Strassburg, had declared himself to be the first of two witnesses to the imminence of the Second Coming, and had proclaimed that the divine event would take place in Strassburg at a precise date and hour in A.D. 1533. After this date had been surmounted without incident, Hofmann's Netherlander khalifah, Jan Matthys the baker of Haarlem, declared himself to be the second witness and changed the *venue* to Münster, where he duly established his militant Messianic commonwealth in February 1534. After Matthys' death in a sortie against the Prince Bishop's free lances on the Easter Day of that year, the prophet's mantle fell on the shoulders of Matthys' disciple Jan Bockelson the tailor of Leyden. And this epigonus of Hofmann's diadochus styled himself 'King of the New Jerusalem' and 'King of Righteousness with universal dominion', to whom God had given the sceptre of David and the sword that was 'to cleave its way through all the World, for the punishment of the unrighteous and the protection of the godly'.⁴ From first to last the Anabaptist régime in Münster was a reign of terror. In the early days of the revolution Matthys preached in a sermon the killing of all Lutherans, Papists, and other unbelievers, in accordance with the Anabaptist doctrine that the ungodly ought to be, not merely boycotted socially, but also physically exterminated. As a compromise with mercy, all who refused to be re-baptized were driven out of the city destitute two days later.⁵ The exiles' goods were impounded by the newly established rulers of the revolutionary commonwealth. The city guilds were overthrown, and communal workshops, breweries, and bakeries were set up, as well as communal eating-houses.⁶ For the sanctification of his own lusts the Messianic King John compelled his subjects to adopt polygamy.⁷

⁷ Carew Hunt, 1928, p. 284; idem, 1929, pp. 87-8.

At the very time when the short-lived Anabaptist New Jerusalem at Münster in Westphalia was being established and defended by the swords of the Netherlanders Jan Matthys and Jan Bockelson, the Netherlander Menno Simons¹ and the Tyrolese Jacob Hutter were organizing, in Holland and in Moravia respectively, two other Anabaptist communities which were likewise segregatory, communistic, and authoritarian,² but which differed from the disastrous experiment at Münster in the capital point of being pacifist instead of militant.³ Hutter's and Menno's policy for dealing with the ungodly was not to draw the sword against them but to take pains not to give them provocation to draw their own swords against the elect; and since in Moravia, Westphalia, the Netherlands, and indeed everywhere the Anabaptist Chosen People were overwhelmingly outnumbered by the Catholic and Protestant Gentiles, this difference of policy spelled, for Menno's and Hutter's followers and their descendants, the whole difference between extermination and survival. Instead of perishing with the sword like the Melchiorites, the Mennonites and the Hutterites brought upon themselves the more surprising and ironic fate of being slowly stifled by the inevitable rewards of their own distinctive virtues.

Hutter interpreted the Anabaptist institution of communism, not as conferring a licence to spoil the Egyptians, but as imposing upon the Chosen People themselves a religious duty of working unselfishly, conscientiously, and indefatigably for the benefit of the elect community.⁴ Starting with a technological superiority over the native Moravian Slavs,⁵ the German Anabaptist refugees on Moravian soil soon concentrated their energies upon handicraftsmanship in preference to agriculture⁶ and won powerful protectors by making themselves useful to the Moravian landlords as artisans and bailiffs. The very practical success of this policy

¹ See Krahn, C.: *Menno Simons, 1496-1561* (Karlsruhe 1936, Schneider).

² For the key-points in Hutter's system see Müller, op. cit., p. 77. For the origins of the Moravian branch of the Anabaptist movement see Beck, J. von, and Loserth, J.: 'Der Anabaptismus in Tirol,' in *Archiv für Österreichische Geschichte*, vols. 78 (1892), 79 (1893), and 81 (1895); and Loserth, J.: *Balthasar Hubmaier und die Anfänge der Wiedertaufe in Mähren* (Brünn 1893, Winiker). See further Hrubý, F.: 'Die Wiedertäufer in Mähren' in *Archiv für Reformationsgeschichte*, vol. xxx (1933), pp. 1-36 and 170-211, and vol. xxxi (1934), pp. 61-102.

³ The contrast between Menno and Hutter, on the one side, and the ghāzis of Münster, on the other, is reminiscent of the contrast between Johanan ben Zakkai and the Jewish Zealots in A.D. 66-70 (see the present chapter, pp. 75-6, above). In the view of Mr. R. N. Carew Hunt, as expressed in a letter to the writer of this Study, 'the Münster revolt was really a caricature of the movement, which was essentially pacific, and it contained all the worst aspects of Müntzer's teaching (e.g. its emphasis on the Old rather than on the New Testament). Certainly it showed what fanaticism will accomplish; and all Western Europe, Catholic and Protestant, was appalled by it. But it was repudiated by all responsible Anabaptist leaders, and its whole policy and direction was opposed to the generally accepted tenets of the sect.'

⁴ Müller, op. cit., p. 90.

⁶ Ibid., p. 91.

of Gentleness seems gradually to have softened the Hutterites' moral fibre, and this moral decay seems already to have gone too far to be arrested by the blow which the sect suffered in A.D. 1622, when it was expelled from its settlements in Moravia and was confined to the daughter colonies in Hungary and Transylvania.¹ In the colony at Velké Leváry, in Hungary, the fundamental Anabaptist institution of the community of goods was formally abandoned in 1685.² In 1733 these degenerate Anabaptists renounced the symbolic rite from which they derived their name, and allowed their children to be baptized thenceforward in infancy into the Catholic Church.³ In 1741 they departed from the pacifism which was the Hutterites' distinctive mark, and supplied the Royal Hungarian Government with two recruits to fight as hussars against Frederick the Great.⁴ Finally, in 1760-4, they submitted to a forcible wholesale conversion to Catholicism.⁵ Thereafter a fraction of the former Hutterite community at Alvintz in Transylvania found asylum first in Wallachia and eventually in the Ukraine, where their descendants have survived down to this day and have even planted North American offshoots in South Dakota and Alberta.⁶ These survivors, however, are no more than a 'living museum' of the Hutterite Anabaptist *imperium in imperio* in Moravia which had its brief *floruit* in the latter part of the sixteenth century; and the history of the Menonites has run a parallel course of re-assimilation which has been the more remarkable inasmuch as it has been accomplished without any pressure from outside and without any formal abjuration of the community's separatist tenets. With the inevitability of gradualness 'the epoch of heroic exaltation gives place to the banality of a petty tradesman's life'.⁷ And thus, while the Anabaptists who took the path of Violence duly perished by the sword within ten years of the foundation of the sect in 1525, those who chose the alternative way of Gentleness have also been eliminated in due course by the slower yet ultimately not less effective process of re-absorption into the main body of the Western body social.

Within a narrower range of action and on a lower emotional key the history of the Anabaptists has been repeated in that of the Quakers.

In the first generation of the life of this English sect a vein of Violence, which found vent in naked prophesyings and in noisy disturbances of the decorum of church services, drew down upon

the Quakers a savage chastisement from Episcopalians in England and from Presbyterians in Massachusetts. This Violence, however, was quickly and permanently superseded by a Gentleness which became the Quakers' supreme and characteristic rule of life; and the Society of Friends then for a time seemed destined to play in a modern Western World the classic role of the Primitive Christian Church on whose spirit and practice, as set forth in *The Acts of the Apostles*, they devoutly modelled their own lives, like the Hutterites and the Mennonites before them. But, while the Friends of later generations have never fallen away from the victorious rule of Gentleness, they have long ago travelled right out of the proletarian path which their history for a short time seemed to lay down for them, and, like the Hutterites and the Mennonites again, they have been, in a sense, the victims of their own virtues. It might indeed be said of the Friends that they have achieved material prosperity in their own despite; for much of their success in business can be traced to formidable decisions which Friends have taken at the bidding of conscience, with a trustful faith in God, in the belief that they were acting to the detriment of their own material interests. The first step in their march to material prosperity was taken, all unwittingly, when this originally rural sect migrated from the country-side to the cities, not because they had lost their hereditary agrarian livelihood or because they were tempted by the lure of higher urban profits, but because a voluntary migration seemed the most obvious way of reconciling a conscientious objection to the payment of tithes to the Episcopalian Established Church of England with an equally imperious objection to the alternative course of resisting the tithe-collector by force.¹ Thereafter, when Quaker brewers took to manufacturing cocoa and chocolate because they had come to doubt the lawfulness of supplying their fellow men with an intoxicant, and when Quaker retail shopkeepers took to marking their goods with fixed prices because they scrupled to vary their price in 'the haggling of the market', they were deliberately risking their fortunes for the sake of their faith; and no doubt it seemed to them—as it did to a malevolently quizzical audience of philistine spectators—that in obeying their conscience they were facing blue ruin. The opposite event has illustrated the little-heeded truths that 'honesty is the best policy' and that 'the meek . . . shall inherit the Earth'; but by the same token it has debarred us from retaining any members of the Society of Friends upon the muster-roll of our Western internal proletariat.

In order to find any lasting or recent example of the proletarian

¹ On this point see II. D (vi), vol. ii, p. 220, footnote 2, above.

Gentleness for which we are in search, we must range beyond the limits of the native Western body social and must bring within our purview the societies of alien culture which have been annexed to our Western internal proletariat by some military or economic or cultural act of conquest. If we allow ourselves this licence, then we can place to the Western proletariat's credit the gentleness of a Gandhi eschewing the violence of the Bengali revolutionaries¹ and the gentleness of a Tolstoy condemning the violence of the Russian Nihilists, to reinforce the native Western pacifism of a Lansbury and a Sheppard.

When we have cast our net for Gentleness and taken so small a catch, it almost goes without saying that we shall fare no better when we scan the works of our Western internal proletariat in search of evidence of a creative religious activity; for, in our survey of the histories of other internal proletariats, we have seen already that it is the gentle and not the violent vein which is apt to be fruitful in the religious field.

If we follow the clues that are offered to us by the histories of the 'higher religions' which were adopted or adapted or created by the Hellenic internal proletariat, we shall find two rather faint modern Western analogues of Christianity and Manichaeism and the worships of Mithras and Isis and Cybele in two religious movements of Islamic origin, the Bahā'iyah² and the

¹ See the present chapter, pp. 106 and 158, above.

² The Bahā'iyah Sect is a derivative of the Bābī Sect, whose founder Sayyid 'Alī Muhammad of Shirāz declared himself to be 'the Bāb' (i.e. 'the Gate' of the Twelfth Imām Mahdī of the Imāmī Shī'ah) in A.D. 1844, and eventually claimed to be the inaugurator of a new dispensation, and a manifestation or incarnation of God. The Bābī movement was promptly denounced by the Imāmī Mujtahids and persecuted by the Persian Government; and the Bāb himself, after being thrown into prison at Mākū, was put to death at Tabriz in 1850. After the persecution had become intensified as a result of an attempt to assassinate Nāsir-ad-Dīn Shāh which was made by Bābī fanatics in 1852, a band of Bābīs was led into exile by the Bāb's at that time generally acknowledged successor, the Subh-i-Azal Mirzā Yahyā. Their first asylum was Baghdad, and here the party was joined by Mirzā Yahyā's elder half-brother, Mirzā Husayn 'Alī. In 1864 the exiles were transferred from Baghdad to Constantinople, and thence to Adrianople, by the Ottoman authorities. At Adrianople, in 1866-7, Mirzā Husayn 'Alī, who had long since been the leader of the exiles *de facto*, declared himself to be 'Him whom God shall make Manifest': the greater prophet of whom the Bāb had professed himself—at least in one phase of his teaching—to be the forerunner. This declaration may be taken as the genesis of the Bahā'iyah Sect; since Mirzā Husayn 'Alī, under the title of Bahā'u'llāh ('the Manifestation of the Beauty of God'), captured from his brother the allegiance of all but an insignificant minority of the Bābīs, in Persia as well as abroad, and was thenceforth regarded by his followers as the founder of their religion, while the figure of the Bāb tended to diminish in stature and to recede into the background (compare the progressive eclipse of Marx by Lenin in the Communist Church of the Soviet Union). In 1868 the Ottoman Government banished Subh-i-Azal to Famagusta in Cyprus and Bahā'u'llāh to 'Akkā on the Syrian coast, where Bahā'u'llāh continued to reside until his death in 1892. The rigorous internment to which the head of the Bahā'ī community was at first subjected at 'Akkā was gradually relaxed, but it was re-imposed upon Bahā'u'llāh's son and successor 'Abd-al-Bahā from 1901 until the Ottoman Revolution of 1908. These physical restrictions, however, did not prevent the propagation of the new religion into Europe and America; and after his liberation in 1908 Abd-al-Bahā went in person on a missionary journey which lasted from 1911 to 1913 and carried him as far afield as the Pacific coast of the United

Ahmadiyah.¹ These two variations upon Islam have arisen in the Iranic World—the Bahā'iyah in Persia and the Ahmadiyah in the Panjab—since the time when the Iranic World first began, about a hundred years ago, to feel our Western pressure, just as the five Oriental religions which we have cited as Hellenic parallels arose in the Hittite and Egyptian and Syriac worlds after these had been overrun and overlaid by an expanding Hellenism. Again, the Bahā'iyah and the Ahmadiyah movements are alike distinguished by a spirit and cult and practice of gentleness² which stand out in sharp contrast to the militancy of the Islam³ from which they are both derived; and this contrast recalls the similar antithesis between the gentle ethos of Christianity and Manichaeism and the violent ethos of Maccabaeen Judaism and Sasanian Zoroastrianism.⁴ A further point of resemblance is that—again like Manichaeism and Christianity—the Bahā'iyah and the Ahmadiyah have been persecuted in their own world and have gone out to seek a kindlier soil for

States. (For the history and doctrines of Babism see Browne, E. G.: 'The Bābis of Persia' in the *Journal of the Royal Asiatic Society*, vol. xxi [new series] (London 1889), pp. 485–526 and 881–1009; eundem: *A Traveller's Narrative written to illustrate the Episode of the Bāb*, edited and translated (Cambridge 1891, University Press, 2 vols.); eundem: Mirzā Huseyn's *New History of the Bāb* translated (Cambridge 1893, University Press); eundem: 'Personal Reminiscences of the Bābi Insurrection at Zanjan in 1850, translated from the Persian' in *J.R.A.S.*, vol. xxix [new series], (London 1897); eundem: *Kitāb-i-Nuqtatu'l-Kāf*, being the earliest history of the Bābis, compiled by Hajji Mirzā Jāni of Kāshān = E. J. W. Gibb Memorial Series, vol. xv (London 1910, Luzac); eundem: *Materials for the Study of the Bābi Religion* (Cambridge 1918, University Press); eundem: *A Literary History of Persia*, vol. iv (Cambridge 1928, University Press). For an account of Bahaism from the Bahā'i standpoint see Esslemont, J. E.: *Bahā'u'llāh and the New Era* (London 1923, Allen and Unwin). For the injustice done to the Bahā'i community in 'Irāq by the Government of the newly fledged sovereign independent 'Irāqi State, at the instigation of the local Shi'i community, see Toynbee, A. J., and Boulter, V. M.: *Survey of International Affairs*, 1934 (London 1935, Milford), pp. 119–22).

¹ The Ahmadiyah Sect was founded in 1882 by Ghulām Ahmad of Qādyān (a place in the Ghurdāspūr district of the Panjab), who claimed to be the Messiah and the Mahdī. After the death of the founder on the 26th May, 1908, the Ahmadiyah split into two branches, with head-quarters at Qādyān and Lahore respectively (the Lahore branch being the more susceptible to Western ideas). Both branches have embarked on missionary activities not only in the Islamic World, but in Great Britain, the United States, and Germany. (See M. Th. Houtsma: 'Le Mouvement Religieux des Ahmadiyya aux Indes Anglaises' (in *Revue du Monde Musulman*, i, 1907, pp. 533–76); H. A. Walter: *The Ahmadiyya Movement* (Calcutta 1918, Oxford University Press); Mirzā Bashir-ad-Dīn Mahmūd Ahmad [son of the founder, and head of the Qādyān branch]: *Ahmad the Messenger of the Latter Days*, Part I (Qādyān 1924; and Madras 1924, Addison Press); eundem: *Ahmadiyyat or the True Islam* (Qādyān 1924); Mawlānā Muhammad 'Alī [head of the Lahore branch]: 'The Ahmadiyya Movement' (in *The Light of Lahore*, 16th October, 1925, translated in *Oriente Moderno*, vi, 2, pp. 108–23.)

² Bahā'u'llāh declared for Non-Violence (see Browne in *J.R.A.S.*, vol. xxi [new series], pp. 954–9, and in *A Traveller's Narrative*, vol. ii, p. xl), in contrast to the militancy into which the Primitive Bābis had lapsed after the imprisonment of the Bāb at Mākū in A.D. 1847.

³ The Sunnah has been militant from first to last, and, while the Shi'ah has sometimes taken on an appearance of gentleness, this has perhaps usually reflected a lack of the power rather than the will to take to violent courses. The Carmathians in the tenth century of the Christian Era and the Ismā'ilis in the eleventh and twelfth centuries were more violent than any Sunnis; and violence has also been the keynote of the militant revival of Imāmī Shi'ism by Ismā'il Shāh Safāwī (see I. C (i) (b), Annex I, in vol. i, above, and V. C (i) (d) 6 (δ), Annex, pp. 661–5, below.).

⁴ See the present chapter, pp. 125–6, above, with the references there given.

their seed in the alien world which has imposed itself upon theirs so masterfully. When the Bāb, who was the forerunner of the prophet of Bahaism, was put to death by his Persian countrymen, and when life in Persia was made almost impossible for the martyred prophet's disciples, the Bāb's successor Subh-i-Azal sought asylum at Baghdad; after the eviction of the exiles from 'Irāq, Subh-i-Azal's supplanter Bahā'u'llāh eventually found a secure resting-place at 'Akkā on the Mediterranean coast of Syria; and from this last well-sited base of operations the Bahā'is have launched their propaganda into the Western World and have gathered Western converts into their fold as far afield as Chicago. The same road has been trodden by the Ahmadi's, who have gained a footing in Europe and America while they have been ignored in their native Panjab and persecuted in their nearest mission-field in Afghanistan.¹ We are reminded of the westward march of Christianity and Manichaeism into the Hellenic World after Jesus had been put to death at Jerusalem and Mani at Ctesiphon, while the relation of Bahaism to Babism calls to mind the relation between Pauline Christianity and the more nebulous pre-Pauline faith that was grasped and shaped and clarified by the Apostle to the Gentiles.

When we turn from the alien 'higher religions' to the alien philosophies that made simultaneous conquests in the Hellenic World, we shall find a counterpart of the Babylonian pseudo-science of Astrology in the Hindu pseudo-science of Theosophy, whose exponents address themselves to a Western public of much the same kind as the Hellenic public which once succumbed to the Chaldaean *mathematici*: a public which has become too conceitedly sophisticated to abide in its own ancestral traditions, but which has not learnt either how to fill for itself the self-inflicted spiritual void in its soul or how to appraise at their proper worth or worthlessness the pretentious alien spiritual wares which are dangled before its uncritical eyes by a swarm of skilful and not always scrupulous salesmen.

We may also now perhaps venture to prophesy that our indigenous modern Western Science will undergo in the course of time a metamorphosis like that which has transformed the philosophy of Siddhārtha Gautama into the Mahāyāna² and the philosophy of Plato into the religion of Neoplatonism³ and the philosophy of the

¹ For the persecution of the Ahmadiyah in Afghanistan in A.D. 1924-5 see Toynbee, A. J.: *A Survey of International Affairs*, 1925, vol. i (London 1927, Milford), p. 568.

² See the present chapter, pp. 133-6, above, and V. C (i) (d) 6 (δ), p. 552, below.

³ See IV. C (iii) (c) 2 (α), vol. iv, pp. 271-2, above, and V. C (i) (d) 6 (δ), pp. 545-52, below.

Tao into an explosive mixture of magic and militancy.¹ Already we are beginning to doubt whether our classic nineteenth-century scientific method of weighing and measuring, in which we have put our intellectual trust, is really a talisman which can be counted upon to transmute subjective thought into objective truth; and in the youthful postures of Psycho-analysis, which is the callowest of our Western scientific disciplines, we can see the first tentative essays in a new attitude of mind and cast of feeling and bent of will. Under the mask of a super-intellectualism we detect the resurgent and rebellious spirit of Primitive Man in the act of stealthily slinking back towards its Kingdom of Ancient Night in the hope that, in this reassuring disguise, the truant may be able to elude the vigilance of the secularized angel who wields the flaming sword of scientific scepticism. Is it the humiliating destiny of our Western Science to pander to our *nostalgie de la boue*? Will the twenty-fourth century of the Christian Era bring forth some Rumanian Iamblichus, or the twenty-fifth century some Mexican Proclus, to conjure a rank Neohuxleian theurgy out of a senile experimental technique? The hard-headed chemist or biologist of the present generation whose first impulse will be to scout this vision of our Western mental future as an extravagantly fantastic *jeu d'esprit* will do well to pause and take stock of a not less strange metamorphosis which has actually been taking place under his nose in one great province of the Westernized World of to-day; for in Marxian Communism we have a notorious example in our midst of a modern Western philosophy which has changed, in a lifetime, quite out of recognition by transforming itself into a proletarian religion, taking the path of Violence, and carving out its New Jerusalem with the sword on a Russian scale which utterly dwarfs the sixteenth-century Anabaptist Messianic city-state in Westphalia.

If Karl Marx had been challenged by some Victorian *censor morum* to give his spiritual name and address, no doubt he would have described himself, in all good faith, as a disciple of the great modern Western philosopher Hegel, and would have added that he had made it his own personal philosophic task to apply the Hegelian dialectic to the economic and political phenomena of modern Western social life. In the same Hegelian tradition Lenin, the Russian disciple of Marx, and perhaps—who knows?—even Stalin, the Caucasian disciple of Lenin, would have thought and spoken of himself as a philosopher first and foremost,² and would

¹ See the present chapter, pp. 146-7, above, and V. C (i) (d) 6 (δ), p. 557, below.

² 'Whereas in France, England, Germany, and everywhere throughout the West, Socialism first manifested itself as Christian or religious socialism, Russian socialism was from the outset a philosophic movement, influenced by Western philosophic doctrines,'—Masaryk, T. G.: *The Spirit of Russia* (English translation: London 1919, Allen and Unwin, 2 vols.), vol. ii, pp. 356-7.

have taken an even greater pride in his mastery of the dialectic method than in his power of controlling economic forces and ruling the hearts of men. Yet all the time it is patent to the judicious observer that the picture which paints Communism as a kind of applied philosophy is ludicrously inadequate and misleading; for even in the original Marxian ideology, not to speak of its Leninian and Stalinian application to life, the Hegelian dialectic is only one of the ingredients—and not the dynamic one at that! The elements which have made Marx's version of Hegelianism an even more explosive mixture than Chang Ling's version of Taoism¹ are not derived either from Hegel or from any other modern Western philosopher: they most of them bear on their face their certificate of origin from the ancestral religious faith of Western Christendom—a Christianity which in the nineteenth century, three hundred years after the delivery of the modern Western philosophic challenge by Descartes, was still being drunk in by every Western child with its mother's milk and inhaled by every Western man and woman with the air which the creature breathed. And such of the dynamic elements in Marxism as cannot be traced to Christianity can be traced to Judaism—the 'fossilized' parent of Christianity which had been preserved by a Jewish Diaspora in the Western World and had been volatilized through the opening of the Ghetto and the emancipation of the Western Jewry in the generation of Marx's grandparents.

The distinctively Jewish (or perhaps originally Zoroastrian) element in the traditional religious inspiration of Marxism is the apocalyptic vision of a violent revolution which is inevitable because it is the decree, and irresistible because it is the work, of God himself, and which is to invert the present roles of Proletariat and Dominant Minority in a tremendous *peripeteia*—a reversal of roles which is to carry the Chosen People, at one bound, from the lowest to the highest place in the Kingdom of This World.² Marx has taken the Goddess 'Historical Necessity' in place of Yahweh for his omnipotent deity,³ and the internal proletariat of the

¹ For the (perhaps partly legendary) story of Chang Ling, the Taoist philosopher-alchemist who received a supernatural command from his (perhaps quite legendary) master, Lao-tse himself, to give happiness to Mankind, and who fulfilled this behest by founding, on the borders of the present Chinese provinces of Shensi and Szechwan, a model community which, in the reign of the founder's grandson, played a militant part in the proletarian insurrections against the expiring Han régime in the last quarter of the second century of the Christian Era, see Cordier, H.: *Histoire Générale de la Chine* (Paris 1920-1, Geuthner, 3 vols.), vol. i, pp. 189-90; Hackmann, H.: *Chinesische Philosophie* (Munich 1927, Reinhardt), p. 228; Franke, O.: *Geschichte des Chinesischen Reiches*, vol. i (Berlin and Leipzig 1930, de Gruyter), pp. 419-21. This latter-day aberration of Taoism has been mentioned already in the present chapter, pp. 146-7, above.

² For the originally mundane emplacement of the Messianic Kingdom in the futurist expectations of the Jews see V. C (i) (d) 9 (γ), vol. vi, pp. 120-3, below.

³ This Marxian Jewish Goddess 'Historical Necessity' has a sister in the Falasha Jewish Goddess Sanbat (see II. D (vi), Annex, in vol. ii, p. 406, above) and in the

modern Western World in place of Jewry;¹ and his Messianic Kingdom is conceived as a Dictatorship of the Proletariat.² But the salient features of the traditional Jewish apocalypse protrude through this threadbare disguise, and it is actually the pre-Rabbinical Maccabaeon Judaism that our philosopher-impresario is presenting in modern Western costume; for it is of the essence of the Marxian apocalyptic doctrine that the Messianic Kingdom is not only to be a material kingdom in This World but is also to be won by a victorious stroke of violence. If this archaic Futurism is the distinctive Jewish element in the Marxian faith, the distinctively Christian element is an Oecumenicalism which is positively antipathetic, and not merely foreign, to the Jewish tradition. 'Go ye into all the World and preach the Gospel to every creature'³ is an injunction which Marx feels to be laid upon himself, and which he lays in turn upon his followers, as imperiously as the duty of establishing the kingdom of righteousness by force. It is not merely a revolution but a world revolution that the good Marxian is in duty bound to strive for.⁴

It is a far cry from the Hegelian dialectic to the embattled church militant of a Soviet Union Communist Party⁵ which with one hand is defending and organizing, through the Government of the Soviet Union, the ground which the Marxian Faith has now already won by the sword, while with the other hand it is working for the completion of the World Revolution through the agency of the Third International. The Marx who has conjured this matter out of that spirit by blending Syriac religion with Western philosophy is a mighty magician. He has performed as extraordinary a feat of 'materialization'⁶ as his Hellenic prototype Blossius of Cumae;⁷ the Stoic prophet of revolution⁸ who was not

Elephantinian Jewish (or Judaeo-Samaritan) Goddesses 'Anath-Yahū and 'Anath-Bethel (see V. C (i) (d) 7, vol. vi, p. 46, footnote 1, below).

¹ Compare the substitution of the internal proletariat of the Hellenic World for Jewry by the Christian Church under the influence of the Apostle to the Gentiles.

² In the Marxian eschatology the Dictatorship of the Proletariat is represented as a transient régime which is destined to give place to a stateless form of society as soon as Socialism has become ingrained into the fabric of human life sufficiently to work by itself without any further need of organized force to back it. A similar transitoriness is, of course, one of the traditional features of the Jewish Messiah's millennial reign on Earth.

³ Mark xvi. 15.

⁴ For the socialist element in Marxism and its relation to Christianity see V. C (i) (c) 2, Annex II, below.

⁵ The Bolshevik or Majoritarian wing of the Russian Social-Democratic Party renamed itself 'the Russian Communist Party' (in homage to the Paris Commune of A.D. 1871) in March 1918 and 'the Soviet Union Communist Party' in May 1924 (in consonance with the by then accomplished fact of the reorganization of the former Russian Empire into a Union of Soviet Socialist Republics in which the Russian Soviet Federative Socialist Republic was only one (albeit the largest and strongest) of the half-dozen original states members of the Union).

⁶ Or of 'counter-etherialization' in the language of the terminology which we have coined in this Study (see III. C (i) (c), in vol. iii, above).

⁷ See further V. C (ii) (a), vol. vi, p. 249, below.

⁸ The question whether it was because of, or in spite of, his Stoicism that Blossius

only Zeno's disciple but was also the master of Tiberius Gracchus and Aristonicus.¹ And, if it had pleased the Goddess fortune to crown Aristonicus's proletarian insurrection with success, then no doubt the names of the Italio Greek prophet and his Pergamene khalifah would be resounding down to this day as loudly as the names of Marx and Lenin do ring in the ears of a generation which has witnessed the triumphant establishment, on Russian ground, of a Marxian counterpart of that Blossian 'City of the Sun'² which Aristonicus tried and failed to establish in Asia Minor in the second century B.C.

Fortune decided otherwise; and the god Helios, to whom Aristonicus's commonwealth was dedicated, no more availed to save his Asiatic Heliopolis than the goddess Atargatis availed to save the contemporary Sicilian freedmen's state that was placed under her auspices by the Syrian slave-prophet Eunus.³ These attempts in a disintegrating Hellenic World to convert a proletarian religion and a proletarianized philosophy into political coin by force of arms were both promptly crushed by Roman military intervention, and they simply served to prove in action a truth which was put into words more than a century later by another leader of the Hellenic internal proletariat when he refused, in the crisis of his earthly career, to follow in Eunus's and Aristonicus's footsteps: 'for all they that take the sword shall perish with the sword.'⁴ The historical verdict which was pronounced in the Roman military victory over Eunus and Aristonicus was not shaken by the desperate attempts to reverse it which were made in succession by the authors of the Second Sicilian Slave-Revolt and by Spartacus and by Catiline; and some time before the tormented Hellenic World obtained the respite of the *Pax Augusta* it had already become clear that its destiny, whatever it was to be, was at any rate not foreshadowed in the apocalyptic vision of an internal proletariat which had gone, in desperation, upon the war-path.

became a revolutionary and went into practical politics on the forlorn hope of attempting to translate his dream into reality is a matter of controversy among modern Western scholars. According to one view, 'pour tirer les opprimés de leur inertie apathique, il fallut un grand élan de mysticisme dont les missionnaires stoïciens se firent les propagateurs' (Bidez, J.: *La Cité du Monde et la Cité du Soleil chez les Stoïciens* (Paris 1932, Belles Lettres), p. 50). According to another view, 'the slavery question shows that Aristonicus's inspiration was not Stoicism, i.e. Blossius (as Bidez thinks). . . . What moved Blossius was doubtless sympathy with the under-dog and perhaps a family tradition of hostility to the Roman Optimates' (Tarn, W. W.: *Alexander the Great and the Unity of Mankind* (London 1933, Milford), p. 34, footnote 54).

¹ For Aristonicus see the present chapter, pp. 69-70, above, with the references there given.

² For the worship of the Sun as the divinity who takes up the cause of the Internal Proletariat, see V. C (i) (d) 6 (δ), Annex, p. 692, footnote 2, below.

³ For Eunus see further V. C (ii) (a), Annex II, vol. vi, *passim*; for the First Sicilian Slave-Revolt, of which Eunus was the leader, see the present chapter, pp. 69-70, above.

⁴ Matt. xxvi. 52.

In our Western World in our generation the Leninian attempt to fulfil the scripture of the Marxian apocalypse has been treated more kindly by Fortune, at least in the first chapter; for Lenin's proletarian commonwealth on Russian soil has successfully repulsed the first attempt of the Western dominant minority (or 'the Capitalist Society' as it is called in the monomaniacally economic language of the Marxian Sociology) to overthrow the new régime in its puny infancy. More fortunate than his counterparts in the second century B.C., who had to face a dominant minority whose forces were then united under the single command of the omnipotent and ubiquitous power of Rome, Lenin made his *coup* in a world in which the dominant minority was still profoundly divided against itself and was engaged at that very moment in an internecine world-war; and the contending 'Capitalist' states all played their unwilling part in working for the cause of their common arch-enemy. The German Reich gave Lenin his first opening by battering the Russian Tsardom to pieces; and the German authorities actually conveyed the formidable exile himself from Switzerland to Russia across German territory in order that he might complete—to their profit, as they fondly imagined—the task of destruction in which the donkey-work had already been done by German arms. Then, when Lenin succeeded in his enterprise too brilliantly for the Germans' liking, the victorious Allies unintentionally came to Lenin's rescue and saved his work in Russia from being hacked to pieces by the German sword when, for their own purposes, they compelled their defeated German adversaries to evacuate all the occupied Russian territories which Lenin, with his tongue in his cheek, had just ceded to the Central Powers in the Peace of Brest-Litovsk. And after that the nascent military strength of the rising Bolshevik state proved just sufficient for fending off the half-hearted attacks which the war-weary Allies proceeded to make upon the fringes of the Bolshevik domain in the futile hope of dispatching with their own blunted swords the monster whom they had not permitted their German opponents to slay.

In this world of mutually hostile 'Capitalist Powers' which were more concerned to thwart one another than to crush their common proletarian enemy, Lenin's infant Communist Commonwealth in Russia survived the ordeal to which Eunus's Sicilian freedmen's state and Aristonicus's Asiatic Heliopolis both alike succumbed. In the fourth year after Lenin's seizure of power at Petrograd in 1917 it was already clear that the Bolshevik régime was going to maintain itself in all but the outskirts of the derelict domain of the fallen Russian Empire; and eighteen years later

again, in the year 1938, the Union of Soviet Socialist Republics was still 'a going concern', instead of having faded into the mere 'curiosity of history' which was all that was left, within a year or two of Aristonicus's *coup*, of the Blossian militant revolutionary's pathetic attempt to establish a Hellenic Utopia 'in real life'. This striking difference, up to date, between the respective fortunes of our modern Western Hegelian philosophy militant and of its Zenonian counterpart in Hellenic history raises a question in our case which hardly arose in the other. We are driven to ask ourselves whether it may perhaps be the destiny of our Western Society to be taken captive by this militant movement—as formidable as it is bizarre—which claims intellectual descent from a modern Western philosophy, has caught its spirit of violence from an archaic strain in Judaism, has commandeered an ample base of operations in the vast Russian province of a Westernized World, and has been inspired by an echo of the Christian tradition to attempt the conversion of the whole of Mankind.

Ever since Lenin's advent to power at Petrograd in A.D. 1917 this question has been exercising the minds of men and women all over the World and has been arousing their hopes or their fears in accordance with their diverse outlooks and situations. The established Communist masters of the Soviet Union have hoped that they will not taste of death till they have beheld the world-wide triumph of the Marxian creed and régime which their own hands have already carried to victory in Russia. The non-Russian Communist 'Diaspora' *in partibus infidelium*—or in *Dār-al-Harb*, to use the corresponding Islamic term which seems more appropriate to the militancy of the Marxian *éthos*—has hoped that it may live to see for itself the coming of the Dictatorship of the Proletariat which in Russia is already an accomplished fact; and this hope has perhaps been shared to some extent by some of the non-Communist elements in the Western internal proletariat—for instance, among the avowedly subject or nominally independent peoples of alien culture to whom the propaganda of the Third International has been assiduously addressed in the hope of persuading them to join in building up a common 'anti-Capitalist' and 'anti-Imperialist' front. On the other hand the Western dominant minority beyond the borders of the Soviet Union, which has been the principal target of the Third International's attack, has hoped to see the march of Communism towards the World Revolution arrested at least at the present frontiers of the U.S.S.R.; and the *ci-devant* dominant minority in Russia, in so far as it still survives either at liberty in exile or in its homeland under the Bolshevik yoke, has ventured to hope—unfeignedly or in

secret, according to its place of domicile—that a successful repulse of the Communist offensive abroad may some day be followed up by a counter-attack upon the Communist stronghold in Russia, and that this may eventually result in the repatriation of the *émigrés* and the liberation of those who, under the Bolshevik régime to-day, are sitting in darkness and in the shadow of death.

Officially, the opponents of Communism have been expecting daily—every day since the 8th November, 1917—that the Bolshevik régime will collapse to-morrow, while the Latter-Day Saints of the Communist Church Militant have been awaiting, with the same official certitude, a denouement in the opposite sense on the lines laid down in the militant Jewish apocalyptic tradition. According to the orthodox Communist apocalypse, the heathen Capitalist Powers are sooner or later to join forces in a supreme effort to take the Soviet Socialist Jerusalem by storm and to overwhelm the Communist Chosen People; and on that day, when—on the plains of a Manchurian or Ukrainian Armageddon—the Communist Church Militant is standing at bay against a world of aggressors and is apparently facing hopeless odds, her patron goddess Historical Necessity will manifest her power by putting all the hosts of Midian out of action once for all at a single miraculous stroke. Such are the official expectations on either side; but they give little light to any one who is genuinely seeking to forecast the outcome of the conflict; for it has been evident for some time that both parties have ceased to believe in the respective apocalypses to which they are officially committed. For light we have to look, not to dogmas, but to acts; and, when we examine the recent internal political struggles and external political relations of the Soviet Union, we may feel inclined to predict that neither the Communist nor the anti-Communist apocalypse is likely to come true.

The domestic political life of the U.S.S.R. has been dominated, since Lenin's death in 1924, by a schism¹ in the ranks of his companions—not on any point of theoretical Marxian or Leninian doctrine or 'ideology', in which they all subscribe to an identic orthodoxy, but on the practical question of how these sacrosanct principles are to be translated into action here and now. One faction among the Union Communist Party leaders have taken the line that their immediate and paramount task is to bring about the world-wide triumph of the Communist Revolution, and that,

¹ For this schism and its effects upon the domestic politics and foreign policy of the Soviet Union see Florinsky, M.: *World Revolution and the U.S.S.R.* (London 1933, Macmillan), pp. 125-68; Toynbee, A. J., and Boulter, V. M.: *Survey of International Affairs, 1927* (London 1929, Milford), pp. 255-6; *Survey, 1934* (London 1935, Milford), pp. 362-8.

for this purpose, the economic and political and military resources of the U.S.S.R. must be placed unreservedly at the disposal of the Third International. But this Trotskyian policy of 'continuous revolution' has been challenged by an opposing Stalinian policy of 'Socialism in a single country'—a policy which does not question the orthodox Communist doctrine that the Communist Revolution ultimately must be, and will be, world-wide, but does contest the Trotskyian contention that the furtherance of the World Revolution ought to be a first charge upon the assets of the Soviet Union. The first thing to be done, in Stalin's view, is to make Socialism a going concern and a practical success in the one great country in which a Communist régime is already in power; and Stalin contends that this first objective can be attained within the frontiers of the U.S.S.R. independently of what may be happening—or not happening—at the moment in the rest of the World, while admitting that 'Socialism in one country' is only a means to the end of 'Socialism throughout the World', and that, until this consummation is reached, even the most brilliant and imposing achievements in a single country must still be regarded as provisional and precarious. In the year 1938, when the schism was fourteen years old, it was possible to pronounce with some assurance that the Stalinian policy had won. While Stalin was sitting in the Kremlin, Trotsky was vegetating in exile and Zinoviev was rotting in a grave to which he had been sent by the bullets of a firing-squad; and, while the socialization of the Soviet Union was by then an accomplished fact, the Communist World Revolution seemed to be farther off than it had ever been in a world in which Germany had turned National-Socialist. In fact, 'Socialism in a single country' had driven 'continuous revolution' off the field in the arena of Soviet Union domestic politics; and it was noteworthy that the definitive victory of Stalin over Trotsky in Moscow had been quickly followed by an almost sensational change in the relations between the Soviet Union and the states of 'the Capitalist World'.

Since Japan ran amok in the Far East in 1931, and Herr Hitler came into power in Germany in 1933, the Soviet Government has ceased in practice to act upon its official theory of knowing no distinctions between one Capitalist Power and another, and of expecting to see the world-wide triumph of Communism precipitated by a combined attack of all the Capitalist Powers upon the U.S.S.R. Instead, it has begun to show a lively fear lest a concerted attack upon the Soviet Union on the part of two aggressive Capitalist Powers alone may be sufficient to bring about, not the triumph of Communism throughout the World, but its overthrow in its present Russian citadel; and Soviet statesmanship has sought

to parry this threat by making friends among the Mammon of Unrighteousness. As early as 1932 the Soviet Union entered into a political *entente* with France; in 1934 she became a member of the League of Nations; in 1935 she signed treaties of mutual assistance with both France and Czechoslovakia.

These positive acts are proof that Soviet statesmanship no longer expects to see the downfall of Capitalism abroad within any measurable time; for they imply a belief in the reality of the menace to the Soviet Union from the side of Germany and Japan, as well as a belief in the efficacy of an alliance with France and an adherence to the League as expedients for warding the danger off, whereas the peril and the safeguard alike would have to be dismissed in the same breath as sheer illusions by any one who was sincerely convinced that Germany and Japan and France and all the states members of the League were vessels of destruction *ipso facto* because they were products and expressions of an officially doomed Capitalist order of society. Thus the Soviet Government's foreign policy since 1932 presupposes, on the Communist side, a renunciation of the hope of seeing the world-wide triumph of the Communist régime brought to pass within the lifetime of the present generation; and conversely we may infer, on the Capitalist side, a corresponding renunciation of the last lingering hope of living to see the collapse of the Communist régime within the borders of the Soviet Union; for French statesmanship was quite as active as Soviet statesmanship in negotiating the Franco-Soviet *entente* of 1932, and in 1934 most of the existing states members of the League were quite as eager to secure the Soviet Union's adherence as the Soviet Union was to win their consent to its admission; and this attitude implies a belief, in the minds of the statesmen of the Capitalist countries, that the Soviet Union is a valuable associate and not a ramshackle empire that is on the point of falling to pieces. On this showing, it might be said, in the year 1938, that the Soviet Union and a majority, at any rate, of its Capitalist neighbours¹ had reciprocally and simultaneously come to the conclusion that the Communist and the Capitalist régimes were likely to go on existing side by side in the same world for as long a time to come as it was possible for statesmanship to take into account.

¹ Germany, Japan, and Italy are perhaps to be excluded from the list in view of the conclusion of a German-Japanese 'anti-Comintern Pact' on the 25th November, 1936 (see Toynbee, A. J., and Boulter, V. M.: *Survey of International Affairs, 1936* (London 1937, Milford), pp. 925-9), and the adhesion of Italy to this pact, with the status of an original party to it, on the 6th November, 1937 (*Survey, 1937*, vol. i, pp. 43-4). On the other hand, some belief in the stability of the Communist régime in the U.S.S.R. was presumably implied in the diplomatic recognition which was belatedly accorded to the Soviet Union by the Government of the United States in 1933.

We may remind ourselves of the similar conclusion which was arrived at—likewise reciprocally and simultaneously—by the Protestant and the Catholic commonwealths of Western Christendom in the last quarter of the seventeenth century of the Christian Era; and the parallel is illuminating. In that earlier case, as we can now see in the retrospect of the intervening two hundred and fifty years, the mutual decision to live and let live has been followed by a steady convergence, towards a single standard type, between two groups of states whose citizens had previously felt themselves to be divided by so great a gulf that, for the first hundred and fifty years after the outbreak of the Reformation, they had assumed with one accord that Christendom was too small to hold them both. Can we see any symptoms of an analogous approximation to-day between the Communism of the Soviet Union and the Capitalism of the rest of the World? We have only to put the question for it to answer itself decidedly in the affirmative.

We can already discern a pronounced tendency towards convergence in this case likewise, and we can observe that this converging movement is proceeding simultaneously from both sides. The 'Socialism in one country' which is the watchword of the Stalinian régime is manifestly generating a new Soviet Socialist nationalism which is finding its basis not in an old-fashioned uniformity of language but in a new-fangled uniformity of institutions which has its counterparts in the Fascist nationalism of post-war Italy and the National-Socialist nationalism of post-war Germany. Conversely, not only these two dictatorially governed communities but also all the other post-war Capitalist national states in their degree are becoming more and more socialist in their constitution as their nationalism becomes more intense. The convergence between the nationalistic socialism of the Soviet Union and the socialistic nationalism of her neighbours is unmistakable; and we can already make out the lineaments of the new common standard type of community towards which our post-war Capitalist and Communist states are thus all tending. The common goal towards which they are headed is a 'totalitarian' régime in a parochial socialist national state which commands the religious as well as the political allegiance of its subjects and imposes itself upon their souls as their supreme and indeed exclusive object of worship.¹

If we are right in this forecast, it is the destiny of the would-be world-wide movement of Communism to be frustrated thrice over:

¹ For the idolatrous self-worship of the primitive tribe see IV. C (iii) (c) 2 (β), vol. iv, p. 351, above, and V. C (i) (c) 3, in the present volume, pp. 230-1, below. For the relapse of societies in process of civilization into this primitive form of idolatry see the same section of Part IV, *passim*.

first by being imprisoned within the frontiers of a single parochial state; next by being degraded into a local variety of Nationalism after having started its career as a social panacea for all Mankind; and finally by seeing the particular state that has enslaved it gradually assimilate itself to the other sixty or seventy states of the contemporary world by approximating to a common standard type.

This is just the fate by which we should expect to see Communism overtaken on the analogy of the history of other religious or philosophico-religious movements that have similarly turned militant. For example, the militant anti-Hellenic Judaism and Zoroastrianism of the Syriac World in the post-Alexandrine age became imprisoned respectively in the Maccabaeian Kingdom¹ and in the Sasanian Empire;² the militant Imāmi Shi'ism of the Iranic World became imprisoned in the Safawī Empire;³ the militant Muslim-Hindu syncretistic religion of Sikhism became imprisoned in the principality of Ranjit Singh;⁴ and all the four imprisoning states showed the same tendency to approximate in type to their neighbours. The Sikh State became one of those ephemeral 'successor-states' of the Mughal Rāj in India—the Oudes and Rohilcunds—which made their appearance for a moment on the troubled surface of Indian political life before the broken *Pax Mogulica* was re-established as a *Pax Britannica*. The Maccabaeian Kingdom played a corresponding role—until, under the Herodian usurpers, it became scarcely distinguishable in type from the Cappadocias and the Commagenes—as a 'successor-state' of the Seleucid Empire during the brief interval of anarchy which supervened before all these *peritura regna* were expunged by the *Pax Romana*.⁵ The Sasanian Empire both influenced and was influenced by its sole neighbour and rival, the Roman Empire, during the four centuries of their existence in the same world side by side until, on the eve of the Primitive Arab Muslim assault upon them both, it might have needed a practised eye to distinguish the court of Chosroes from the court of Caesar. And South West Asian history repeated itself when a Safawī counterpart of Chosroes prostituted his hereditary head-

¹ For this spiritual imprisonment of Judaism see V. C (i) (d) 6 (δ), Annex, pp. 657-9, below.

² For this spiritual imprisonment of Zoroastrianism see V. C (i) (d) 6 (δ), Annex, pp. 659-61, below.

³ See I. C (i) (b), Annex I, vol. i, pp. 366-93, above, and V. C (i) (d) 6 (δ), Annex, pp. 661-5, below. In this connexion we may recall the fact—already mentioned in the present chapter, p. 175, footnote 2, above—that the latter-day emanation from the Imāmi Shi'ism which is known as Babism has been blighted on its native Persian ground as a penalty for its lapse into militancy. It is not in Iran but in the Ottoman Empire and the Western World, and not in its primitive form but in the new guise of Bahaism, that the seed sown by the Bāb has eventually fallen into good ground and brought forth fruit.

⁴ See V. C (i) (d) 6 (δ), Annex, pp. 665-8, below.

⁵ On this point see Tacitus: *Histories*, Book V, chap. 8.

ship of a religious order to the mundane political ambition of becoming the *Gegenkaiser* to the Ottoman *Qaysar-i-Rûm*. The same historic penalty for the sin of militancy is apparently being exacted from Communism in our world to-day; and we can now almost foresee the time when Communism and Capitalism will be interchangeable names for a uniform idolatrous worship of the community in a standardized parochial 'totalitarian' state. On this showing, we shall be looking in vain if we look to Communism to provide the internal proletariat of a disintegrating Western Society with the makings of a universal church.

The upshot of our present inquiry seems to be that, while the evidence for the recruitment of an internal proletariat is at least as abundant in the recent history of our Western World as it is in the history of any other civilization, there is singularly little evidence in our Western history so far for the laying of any foundations of a proletarian universal church or even for the emergence of any strong-winged proletarian-born 'higher religions'. Communism seems not to 'fill the bill' any better than Anabaptism or Quakerism or Bahaism or Ahmadism; and these five movements, which make so oddly assorted a company, are a small catch to take in a net which we have thrown so wide.

How is this apparent spiritual barrenness of our Western internal proletariat to be interpreted?

On first thoughts we might perhaps be tempted to draw an encouraging conclusion. We might account for this dearth of creative achievement by the fact, which we have already observed,¹ that some of the finest of the plants that have been uprooted in our Western garden have managed hitherto to strike root again on virgin soil. In other words, some of the most promising of the recruits to our Western internal proletariat have been prevented from making any appreciable contribution to a new proletarian culture by the fact that they have been successfully reabsorbed into an unruptured Western body social; and this is a fact on which we may surely congratulate ourselves; since it may be taken to mean that, in our Western Society, the schism between Proletariat and Dominant Minority has been partially repaired, and that the breakdown of our civilization (if it has broken down) has been to that extent retrieved. The talents of these rehabilitated proletarians may have been lost to the proletariat, but they have certainly not been lost to our society as a whole. So far from that, these *déracinés*' descendants—Non-conformist English, French Protestant South Africans, United Empire Loyalist Canadians, and Irish and German Americans—

¹ See the present chapter, pp. 168-73, above.

are reckoned to-day among the most valuable members of the communities on to which they have been grafted or re-attached. On this line of reasoning the spiritual barrenness of the Western proletariat, so far from being a cause for shame or regret, is actually to be taken as presumptive evidence that the condition of our Western body social as a whole, though it may be serious, is not by any means beyond hope. And if, in our own day, our system shows signs of being able still to conquer and transmute so strong a virus as Communism, we may surely flatter ourselves that there is life and health in our Western Society yet.

These may be our first thoughts; but our optimism will be damped when we look narrowly at the price at which our boasted conquest of Communism is being purchased; for the all-absorbing Western institution to which the Marxian Church Militant shows signs of succumbing turns out, as we have seen, to be the pagan parochial 'totalitarian' state; and, if we remind ourselves of the fate of other civilizations that have come to be articulated into states of this kind, we shall find reason to fear that the future history of our own civilization may be 'nasty, brutish, and short'.¹ An unceasing round of internecine warfare of ever increasing intensity between deified parochial states has been the principal cause of the breakdown and disintegration of some, and perhaps most, of the civilizations that have already gone the way of all flesh. The bones of the Hellenic and Sinic societies—to pick out two conspicuous skeletons—lie whitening ominously on fratricidal battlefields. If our own Western Society in its turn is now assuming this fatal posture and falling into this deadly rhythm, then its prospects, so far from being encouraging, are about as bad as they can be;² for the 'drive' of Democracy and Industrialism, which are the two master-forces in our Western World in this latest age, has already entered into both our parochialism and our warfare; and this terrific head of steam seems likely to carry us at an unprecedented speed to an unparalleled disaster.³ On these second thoughts we may be inclined to look for some alternative solution of our puzzle which will not involve the assumption that, in spite of appearances to the contrary, our Western Civilization is really still flourishing like a green bay tree.

If our Western body social is articulating itself to-day into a congeries of parochial 'totalitarian' states which are irreconcilable with one another because each of them refuses to recognize any higher object of worship than itself, then certainly we are approxi-

² See V. C (ii) (b), vol. vi, pp. 312-21, below.

³ See IV. C (iii) (b) 3 and 4, vol. iv, pp. 141-85, above.

mating to the condition in which the Hellenic Society found itself at the moment of its breakdown in the fifth century B.C.; but at this point we shall be struck by a significant difference between Hellenic and Western history. In Hellenic history this parochial paganism was the first state of the ailing society as well as the last; but it has certainly not been the first state—even if it is the present state—of a Western Society which was once entitled to speak of itself as Western Christendom.¹ Moreover, even if we have now at last succeeded in sloughing off our Christian heritage, the process of apostasy has been slow and laborious, and with the best will in the world we are unlikely to have carried it through with all the thoroughness that we might wish; for, after all, it is not so easy to get rid of a tradition in which we and our forebears have been born and bred since the time, now more than twelve hundred years ago, when our Western Christendom was born—a feeble infant—from the Church's womb. When Descartes and Voltaire and Rousseau and Marx and Machiavelli and Hobbes and Lenin and Mussolini and Hitler have all done their best or worst, in their diverse spheres, to de-christianize the various departments of our Western life, we may still suspect that their scouring and fumigating has been only partially effective. The Christian virus or elixir is in our Western blood—if, indeed, it is not just another name for that indispensable fluid—and it is therefore difficult to suppose that the spiritual constitution of our Western Society can ever be refined to a paganism of a Hellenic purity.

Besides, the Christian element in our system is not only ubiquitous: it is also Protean; and one of its favourite tricks is to escape eradication by insinuating a strong tincture of its own essence into the very disinfectants that are so vigorously applied, with intention to sterilize it, by our latter-day neo-pagan social physicians. We have noticed,² for example, the surprising strength and importance of the Christian ingredient in a Communism which purports to be an anti-Christian application of a modern Western philosophy to the practical problems of social life; and, while the violent-handed missionaries of this militant faith betray the extent of their debt to Christianity in the passion with which they deny it, the prophets of Gentleness in a Western or Westernized World—the Tolstoys and the Gandhis—have never sought to conceal their Christian inspiration. The same inspiration is avowed *a fortiori* by those walkers in the way of Gentleness who acknowledge and proclaim themselves Christians like the members

¹ See I. B (iii), vol. i, pp. 32-4, above.

² See the present chapter, pp. 178-9, above.

of the Society of Friends; and we may now remind ourselves of one profoundly touching and impressive religious movement in the bosom of our Western internal proletariat which we have not considered yet in the present context.

Among the many diverse contingents of disinherited men and women who have been subjected, within the last four centuries, to the common ordeal of being enrolled in this Western internal proletariat, the worst sufferers of all have been those Primitive African Negroes who have been uprooted from their homes and sold into slavery on the opposite coasts of the Atlantic. In these slave-emigrants from Tropical Africa to North America we have found our Western analogue of the slave-immigrants who were swept into Roman Italy from all the other coasts of the Mediterranean at the acme of the Hellenic 'Time of Troubles' in the last two centuries B.C.; and we have observed that the Americo-African, like the Italo-Oriental, plantation-slaves met their tremendous social challenge with a religious response. In comparing the two responses at an earlier stage in this Study,¹ we dwelt upon their points of likeness, but there is also a point of difference which is equally striking and also particularly relevant to our present inquiry; and that is the difference in the sources from which these two sets of uprooted plantation-slaves respectively drew their religious inspiration. The Egyptian and Syrian and Anatolian slave-immigrants into Roman Italy found their religious consolation in those ancestral religions which were the sole element in their heritage that they had been able to carry with them into their land of exile; on the other hand the African Negro slave-immigrants into post-Columbian America have lost the whole of their heritage—religion and all²—and have turned for their religious consolation to the hereditary religion of their masters.

How is this difference to be accounted for? In part, no doubt, by the difference in the nature of the social antecedents of the two sets of slaves. The plantation-slaves of Roman Italy were largely drawn from an ancient and deeply cultivated Oriental population whose children might be expected to cling to their cultural heritage with all their might, whereas the African Negro slaves who were imported into America were primitives whose ancestral religion

¹ In II. D (vi), vol. ii, pp. 213-16 and 218-20, above.

² This statement requires qualification, for the modern American Negro converts to Christianity, like the North European barbarian converts of an earlier age, have blended their acquired 'higher religion' with a primitive religious alloy of their own, and the American Negro debasement of the Western Christian religious coinage seems to have been carried to the greatest lengths in those American Negro communities that have been the most successful in emancipating themselves from the White Man's control. In the sovereign independent Negro Republic of Haiti we can observe to-day, in the shape of Voodooism, a recrudescence of the Primitive Tropical African paganism which has quite thrown off the Christian mask.

was no more fit than any other element in their hereditary culture to hold its own against the overwhelmingly superior civilization of their European White masters. This is a partial explanation of the difference in the sequel; but, in order to explain it completely, the cultural difference between the two sets of masters, as well as that between the two sets of slaves, has to be taken into consideration.

We have already observed¹ that the Oriental slaves in Roman Italy had actually nowhere to look, outside their own native religious heritage, for the religious consolation for which they were athirst, since their Roman masters were living in a spiritual vacuum; and even if the Hellenic dominant minority had not already lost faith in the impersonal Italic *numina* and the barbaric Achaean Pantheon, these crude primitive worships which had been repudiated long since by the Hellenic philosophers would scarcely have been embraced by the Oriental worshippers of Cybele and Isis and Mithras and Christ. In fact, in the Hellenic case the pearl of great price was to be found in the religious heritage of the slaves and not in that of their masters, while in our Western case the spiritual treasure, as well as all the worldly wealth and power, has lain in the hands of the slave-driving dominant minority.

It is one thing, however, to possess a spiritual treasure, and quite another thing to impart it; and, the more we think over it, the more astonishing we shall find it to be that these Christian slave-owners' hands should have been able to transmit to their primitive pagan victims the spiritual bread which they had done their worst to desecrate by the sacrilegious act of enslaving their fellow men. How could a slave-driver evangelist ever touch the heart of the slave whom he had morally alienated by doing him a grievous personal wrong? And why was the religion which he brazenly preached to his slave-victims not utterly discredited, in the slave-catechumen's eyes, by the glaring contrast between the precept and the practice of the master-preacher? This Christian religion which has been repudiated in act and deed by the American slave-owner, as well as by the French philosopher in thought and word, must be animated by an invincible spiritual power if it can still win converts under such conditions. It must still be keeping alive, with a life that is all its own, after the dominant minority in a *ci-devant* Western Christendom has presumed to slough its ancestral Christianity off as though a religious integument were as easily shed as the winter skin of a snake in spring-time. And since Religion has no dwelling-place on Earth except in human souls, it

¹ In II. D (vi), vol. ii, pp. 215-16, above.

follows that there must be Christian men and women still abroad in a neopagan world who have never renounced their Christian birthright of citizenship in the *Civitas Dei* in order to become the subjects of King Mammon or King Moloch. 'Peradventure there be fifty righteous within the city';¹ and a glance at the American slave mission-field will show us some of these persistent Christians at work; for the American Negro convert to Christianity does not, of course, really owe his conversion to the ministrations of a plantation-gang overseer with a Bible in one hand and a whip in the other. The real workers of the miracle have been the John G. Fees² and the Peter Clavers.

In this miracle of the slaves' conversion to the ancestral religion of their masters we can see the familiar schism between the Proletariat and Dominant Minority being healed in our Western body social by a Christianity which our dominant minority has been trying to repudiate; and the conversion of the American Negro servile wing of our modern Western internal proletariat is only one among the triumphs of a latter-day Christian missionary activity. The eighteenth-century Methodist preachers who sowed the seed of Christianity in the hearts of the North American slaves were at the same time converting other members of the same internal proletariat who were neither slaves in status nor Negroes in physique: for example, the remote backwoodsmen in the Appalachian mountains and the neglected slum-dwellers in the nascent mining and industrial areas of Wales and Northern England. Nor has the Christian revival in a paganized Western World been confined to the Revivalist Movement in the Protestant Churches. In our post-war generation, in which the lately brilliant prospects of a neopagan dominant minority have been rapidly growing dim, the sap of life is visibly flowing once again through all the branches of our Western Christendom; and this spectacle suggests that perhaps, after all, the next chapter in our Western history may not follow the lines of the final chapter in the history of Hellenism. Instead of seeing some new church spring from the ploughed-up soil of an internal proletariat in order to serve as the executor and residuary legatee of a civilization that has broken down and gone into disintegration, we may yet live to see a civilization which has tried and failed to stand alone, being saved, in spite of itself, from a fatal fall by being caught in the arms of an ancestral church which it has vainly striven to push away and keep at arm's length. In that event a tottering civilization which has shamefully

¹ Genesis xviii. 24.

² See Fee, John Gregg: *Autobiography* (Chicago 1891, National Christian Association).

succumbed to the intoxication of a showy victory over Physical Nature, and has applied the spoils to laying up treasure for itself without being rich towards God,¹ may be reprieved from the sentence—which it has passed upon itself—of treading out the tragic path of *κόρος-ὑβρις-ἄτη*; or, to translate this Hellenic language into a Christian imagery, an apostate Western Christendom may be given grace to be born again as the *Respublica Christiana* which is its own earlier and better ideal of what it should strive to be.

Is such spiritual re-birth possible? If we put Nicodemus's question, we may take his instructor's answer.²

3. *External Proletariats*

The Estrangement of the Proselyte.

The External, like the Internal, Proletariat brings itself into existence by an act of secession from the Dominant Minority of a civilization that has broken down and gone into disintegration; and the schism in which the secession results is in this case palpable; for, in contrast to the Internal Proletariat, which continues to live intermingled geographically with the Dominant Minority from which it has come to be divided by a moral gulf, the External Proletariat is not only alienated from the Dominant Minority in feeling but is also actually divided from it by a frontier which can be traced on the map.

The crystallization of such a frontier is indeed the sure sign that the Secession of the External Proletariat has taken place; for, as long as a civilization is still in growth, it has no hard and fast boundaries except on fronts where it happens to have collided with some other member or members of its own species. Such collisions between two or more civilizations give rise to a set of social phenomena which we shall have occasion to examine in a later part of this Study,³ but at the present stage, for convenience' sake, we will take the licence of leaving out of account these geographical contacts of civilizations with one another, and—for our immediate purpose of studying the disintegrations of civilizations—we will confine our attention for the moment to the situation in which a civilization has for its neighbour, not another society of its own kind, but a society of the primitive species. In these circumstances we shall find that, so long as a civilization is in growth, its frontiers are indeterminate; for, if we first place ourselves at the geographical focus of a civilization that is still in growth—taking our stand at some point where the creative minority of the day can be seen at home and at work—and if we

¹ Luke xii. 21, quoted in the present chapter on p. 166, above.

² See John iii. 1-8.

³ In Part IX, below.

then proceed to travel outwards, in any direction that we choose, until we find ourselves sooner or later in another social environment which is not only different but is unmistakably primitive, we shall not be able—at any point on this journey out of the full light of Civilization into the pitch-black darkness of Savagery—to draw a line and set up a mark and inscribe on our boundary-stone: 'Here Civilization ends and we enter the Primitive World.'

This problem of defining limits is one which does not present itself in the relations between the creative minority and the uncreative mass out of whose midst the minority has arisen; for *ex hypothesi*, if a civilization is still in growth, the creative minority of the day, which has found itself through an act of withdrawal, will also have justified itself by making a successful return; and the success will have consisted—*ex hypothesi* again—in the persuasion of the uncreative mass to adopt that response to the challenge of the day which the creative minority has worked out.¹ A returning minority which had failed to cast its spell over the mass would be like a pinch of yeast which had proved too flat to leaven the lump or like a lamp which had proved too dim to light the room. It would have patently broken down in its ambitious attempt to play the creator's part; and the breakdown of a would-be creative minority brings with it the breakdown of the civilization to which this minority has tried, and failed, to give a lead. Our hypothetical civilization, however, is still—*ex hypothesi*—in growth; and this means that, as a matter of fact, the room has been successfully lit and the lump successfully leavened.

No doubt the creative minority's task of converting its uncreative kith and kin is always difficult to achieve, since it is notorious that 'a prophet hath no honour in his own country';² but we have a double proof that the difficulty is not insuperable. We know this empirically from the patent historical fact that civilizations do grow—or, in other words, do respond successfully not merely to a single challenge but to a series of challenges.³ And we can also tell *a priori* that the task is not impossible because we can see that it is not unlimited in its extent. The room which has to be illuminated may be a cavern of darkness, yet the lamp-light will strike—if only it can radiate so far—upon four walls and a ceiling. The lump which has to be leavened may be a mountain of dough, yet the yeast—if only it can permeate so deep—will eventually have worked its way right through this mountainous lump from top to bottom. In the body social of a

¹ For the relation between a creative minority or individual and the uncreative mass in the process of the growths of civilizations see III. C (ii), *passim*, in vol. iii, above.

² John iv. 44; cf. Matt. xiii. 57=Mark vi. 4; Luke iv. 24.

³ For the serial aspect of the growths of civilizations see Part III. B, in vol. iii, above.

growing civilization we may take it that the whole of the uncreative mass has been touched and stirred by the creative minority in some way or other whenever a challenge receives a successful response. For those who do not catch the inspiration in their souls, 'like a light caught from a leaping flame',¹ are induced to conform externally by the enlistment of their faculty of mimesis.

Thus, when a creative minority successfully performs its role in the life of a growing civilization, the spark which it has kindled gives light unto all that are in the house;² but when this light strikes the walls it is not arrested there, for the walls of a growing civilization are walls of glass in a city that is set on a hill and that cannot be hid.³ The light streams out and on to shine before men;⁴ and, when once the rays have passed through the transparent envelope of the crystal chamber out of which they are radiating, they enter a boundless field in which there is nothing to limit their range except the inherent limitations of their own carrying-power. Accordingly, when the light of a growing civilization shines out upon the primitive societies round about, it travels on until it has faded away to vanishing-point. The luminous focus shades off into a penumbra and the penumbra into an outer darkness; but the gradations are infinitesimal, and it is impossible to demarcate a line at which the last glimmer of twilight flickers out and leaves the heart of darkness in undivided possession of the field.

To re-translate our simile into human terms, we find that in a growing civilization the creative minority of the day exercises its attraction not only upon the uncreative mass in whose midst it has arisen but also upon the primitive societies round about, and that it sometimes makes its influence felt at points that are astonishingly remote from the centre of radiation. The Sumeric Civilization sends forth its gods to win honour in Scandinavia;⁵ the Syriac Civilization radiates its Alphabet into Manchuria;⁶ the Hellenic Civilization makes its aesthetic influence felt in the coinage of Britain⁷ and in the statuary of India.⁸ In fact, the carrying-power of the radiation of civilizations among primitive societies is so great that although the younger of the two species of societies is still very young indeed—perhaps not more than six thousand years old as against the hundreds of thousands of years of Primitive Man's existence on Earth up to date⁹—it has long ago suc-

⁹ See I. C (iii) (c), vol. i, p. 173, above.

ceeded (if the word can be used of an activity that has been mostly unintentional and unconscious) in permeating, at least in some minute degree, the whole congeries of surviving primitive societies. The social radiation that has emanated from the twenty-one civilizations, living and extinct, which we have succeeded in identifying, is diffused to-day throughout the Primitive World like the starlight which just relieves the blackness of a moonless night. And it would probably be impossible for our twentieth-century Western anthropologists to discover—even behind a curtain-wall of limestone precipices in the heart of Papua¹—a primitive society which had entirely escaped the influence of some civilization or other. We may confidently affirm that there is no such thing to be seen in the World to-day as a society in the pristine state in which all societies were living before the first of the civilizations emerged.² The societies that we now describe as primitive can only be called so by courtesy; for these latter-day primitives are no longer the untutored—or unspoiled—savages that their forefathers were; instead, they have turned into partially—if only infinitesimally—civilized barbarians; and in a world in which the goal of Civilization has never yet been reached by any society in process of civilization, even at its highest flights, the least civilized of the barbarians are perhaps less far removed from our semi-civilized selves than they are from their own primitive ancestors of the seventh or hundred-and-seventh millennium B.C.

This all-pervasiveness of the influence of the civilizations in what remains of the Primitive World is the aspect of the relations between the two species of Society which strikes us most forcibly when we view these relations through the primitive societies' eyes and embrace in our survey the whole Time-span of the six thousand years or so that have now elapsed since the first civilizations appeared on the scene. On the other hand, if we look at the same process from the standpoint of the civilizations and narrow down our survey to the Time-span of a single civilization's age of growth, we shall be struck no less forcibly by the fact that the strength of the influence that is radiated out wanes *pari passu* with the extension of its geographical range. As soon as we have recovered from our astonishment at detecting the influence of Hellenic art in a coin

¹ For the discovery, in A.D. 1935, of a previously quite unknown society in a region in the interior of Papua which has been insulated physically by the caprice of Nature see *The Times*, 14th August, 1935, and Hides, J. G.: *Papuan Wonderland* (London 1936, Blackie). In a letter, written on the 25th January, 1950, from the centre of this district, Mr. C. R. Stonor has contested the view—formed by the discoverers and accepted in the first edition of this Study—that the Tari Furora were indebted to some alien civilization, more than to their native powers of invention, for their fine technical technique. 'There is one very minor qualification', he writes. 'They discovered them—a crop which they, without doubt, obtained by occasional trading with coastal tribes, who in turn obtained it from Europeans.'

² On this point see Part II, A. vol. 1, pp. 185-7, above.

that was struck in Britain in the last century B.C. or on a sarcophagus that was carved in Afghanistan in the first century of the Christian Era, the edge is taken off our admiration by the hard fact that Hellenism has only achieved the *tour de force* of travelling so far as this at the price of shedding most of its virtue in the course of the journey. Our British coin looks like a caricature of an original stater of Philip the son of Amyntas, and our Gandharan sarcophagus is convicted of being a vile product of 'commercial art' as soon as we set it side by side with the Alexander Sarcophagus. At this remove mimesis passes into travesty. Yet this only happens at the outer extremity of the radiating civilization's range of action; and even the clumsiest and most perfunctory mimesis has its value—as a means of self-education for the party by whom the act of mimesis is performed, and as a tribute of admiration and token of friendship for the party towards whom the mimesis is directed.

Mimesis is evoked by charm; and we can now see that the charm which is exercised, during the growth of a civilization, by a succession of creative minorities preserves the house not only from being divided against itself but also from being attacked by its neighbours—in so far, at least, as these neighbours happen to be societies of the primitive species. Wherever a growing civilization is in contact with primitive societies, the creative minority of the day attracts their mimesis as well as the mimesis of the uncreative majority in whose midst it arises; and, thanks to this attractive power, a growing civilization seldom finds itself in direct contact with savages whose cultural level is so far below its own as to preclude a friendly understanding. It usually finds itself surrounded by a ring of buffer-societies which are continually absorbing its radiation into their own bodies social and then passing it on, *diminuendo*, to an outer ring, which receives and transmits in its turn until the current of energy finally gives out at the extreme range of the civilization's carrying-power.

If this is the normal relation between a civilization and the primitive societies round about so long as the civilization is in growth, a profound change sets in if and when the civilization breaks down and goes into disintegration. This change can be described in two different ways, according as we speak in the language of Life or in terms of Inanimate Nature.

In the language of Life the breakdown consists in the disappearance from the scene of the creative minorities that have won a voluntary allegiance by the charm which their creative power exerts, and in their replacement by a Dominant Minority which attempts to usurp a heritage that it does not deserve to

inherit, and seeks to gain its end by substituting, for the charm which it lacks, the physical force which still remains at its command.¹ This policy, as we have seen, has the moral effect of alienating the victims of it. It goads them into acts of secession; and, while the secession of the masses in whose midst the Dominant Minority stands gives birth to an Internal Proletariat, an External Proletariat is generated by the secession of the primitive societies round about who, so long as the civilization was in growth, were accepting and transmitting its radiation. It would not, however, be an accurate or a complete account of the change in the attitude of these surrounding primitive societies to describe their act of secession as a withdrawal of mimesis from the now disintegrating civilization; for in falling into disintegration a society ceases to be a whole on which other societies can model themselves, or decline to model themselves, consistently and integrally. The cause of breakdown, as we have seen, is a failure of self-determination;² this failure declares itself in a loss of proportion and harmony and inward unity; and—if we now transpose our description of the phenomena into terms of Physical Science—we shall find that this disintegration (in the literal sense) of the broken-down society's fabric is reproduced in the texture of the rays of the radiation which it continues to emit so long as it remains in existence.

While the rays of social radiation that are emitted by a growing civilization may be likened to rays of white light, in which all the constituent elements of light are blended into a single clear beam, the rays emitted by a disintegrating civilization may be likened to physical light which has been diffracted into a sheaf or fan of separate strands that follow distinct paths and display their diverse elemental colours. In social radiation this change in the texture of the ray, which we have just described as diffraction by analogy with a physical phenomenon, has an important effect on its range; for the three elements—cultural, political, and economic—of which a 'white-light' ray of social radiation is composed differ greatly in their carrying-power; and this difference makes itself felt as soon as they are disentangled from one another.

So long as they are interwoven in a single composite ray, the three strands of social radiation travel at an even speed and to an equal distance—a mean distance and a mean speed which strike the average between their respective capacities. But when once they are set free to go each its own way, the three strands begin to travel at the different speeds and to the different distances which are respectively natural to each of them; and the result is

¹ See IV. C (iii) (a), vol. iv, pp. 123-4 and 131-2, above.

² See IV. C (iii), *passim*, in vol. iv, above.

a differentiation of the disintegrating society's radio-activity—an enhancement of this activity on one plane and a reduction of it on another.¹ Since the carrying-power of the economic element is the highest of the three and is therefore above the average, one effect of the breakdown and disintegration of a civilization is an increase in the expansion of its economic influence; there is sometimes also an increase, above the previously maintained average, on the political plane likewise; and this accounts for an apparent 'law'—which has been revealed in another context² by an empirical survey—to the effect that the geographical expansion of a civilization is apt to go hand in hand with its social disintegration. We have now, however, to observe that this enhancement of radiation on the economic plane—and sometimes even on the political plane—which a civilization gains by going into disintegration, is offset by a proportionate reduction of its radiation on the cultural plane; for the natural rate of radiation on this plane is below the average; and, while in the 'white-light' ray of a growing civilization the cultural element is speeded up beyond its own natural pace, and is carried beyond its own natural range, by its unison with two other elements of greater carrying-power, it drops to its own intrinsic range and pace as soon as it is disentangled from them, just as they rise to their longer intrinsic ranges and higher speeds as soon as they are disentangled from it. In fact, while a disintegrating society surpasses a growing society in its radiation on one, or even two, of the three social planes, it simultaneously falls behind it on one plane at least; and, if we now substitute qualitative for quantitative standards of measurement, we shall be left in no doubt that the net result is a moral loss and not a moral gain.

The difference in value between the three elements of social life is, indeed, extreme; for what we have called the cultural element in a civilization is its soul and life-blood and marrow and pith and essence and epitome, while the political and, *a fortiori*, the economic element are, by comparison, superficial and non-essential and trivial manifestations of a civilization's nature and vehicles of its activity. It is only in so far as it succeeds in radiating itself out on the cultural plane that a civilization can ever genuinely and completely assimilate an alien body social with which it has come into contact; for the most spectacular triumphs of economic and political radiation are imperfect and therefore precarious.

¹ We have already come across this differentiation of a society's radio-activity, on the three different planes of economic, political, and cultural action, in attempting to trace backwards in Time, from the situation as it stands at the present day, the variations in the spatial extension of our Western Civilization (see I. B (iii), vol. i, pp. 26–33, above).

² In III. C (i) (a), vol. iii, pp. 139–53, above. See also IV C (ii) (b) 1, vol. iv, p. 57, above.

Accordingly it is more profitable, both for the society which is emitting the radiation and for the society which is receiving it, that an inch should be gained on the cultural plane than a mile on the political plane or a league on the economic.

On this showing, the expansion of a growing civilization is to be commended for being slow but sure; for in a growing civilization the three elements are either completely blended or at worst only slightly diffracted; and under such conditions all the ground that is won is won on the cultural plane as well as on the other two, while at the same time rather more ground is won by the three elements in combination than could have been won by the cultural element in isolation. By contrast, the expansion of a disintegrating civilization is exposed as being showy but unsound; for, while it forges ahead on the economic plane, and perhaps on the political plane as well, the ground thus superficially gained is never definitively secured by a cultural conquest, since the cultural radiation of a disintegrating civilization is losing momentum in exact proportion to the enhancement of its political and economic radio-activity. In fact—to vary our simile—the economic and political seed which a disintegrating civilization contrives to scatter so far afield is sickly seed sown among thorns.¹

If we now return to the standpoint of the barbarian society which has been receiving the radiation of a growing civilization and has been reacting to it by directing its own faculty of mimesis towards the alien source of this new light and life, we shall see that, when the barbarian society's reaction changes after the civilization's breakdown, the new sense of alienation from a neighbour who has lost his soul and changed his countenance, and the act of secession in which this estrangement issues, do not necessarily involve a complete cessation of all mimesis on every plane. The

¹ 'The tree that grows and flowers is tied to the patch of soil in which it is rooted . . . but its ripe fruits can be sown by every wind no matter how far afield. Strassburg Münster could not have grown to be what it is anywhere but in Strassburg, and the Hagha Sofia not anywhere but in Constantinople; but a "modern building in the Renaissance style" can "be produced" just as well at the South Pole as in the primeval forests of Brazil.'—Frobenius, L.: *Paideuma* (Frankfurt a.M. 1928, Frankfurter Societäts-Druckerei), p. 172. Compare the contrast, noted in the present Study in IV. C (iii) (b) 14, vol. iv, p. 243, above, between the performance of an Attic play at one of the regular festivals in the Theatre of Dionysus at Athens, where the Attic drama had its roots, and the performance of the same play, *post Alexandrum*, by the *Διονυσίου Τεχνίται*, anywhere in the world, from Parthia to Spain. This objective phenomenon of the diffraction of the rays of a disintegrating civilization has a subjective counterpart in 'the sense of promiscuity' which is examined in V. C (i) (d) 6, pp. 439–568, below. The psychological shock that is an apparently inevitable accompaniment of the external disturbance involved in the experience of social 'deracination' seems to be so severe that its effects may be devastating even when the social milieu from which the subject is uprooted is itself an artificial and abnormal environment. For example, when barbarian war-bands break through a *limites* (see p. 208, below)—in a *Völkerwanderung* which first uproots them from the no-man's-land in which they have come into being, and then deposits them in the interior of a *ci-devant* universal state—the consequent shock is apt to throw them into a state of demoralization which is examined in Part VIII, below.

estranged and disillusioned barbarian society may abandon its cultural mimesis of a neighbour whose culture has lost its savour, without ceasing to borrow this neighbour's practical institutions or material technique. In fact, by continuing to borrow these it may be providing itself with the most effective means of ensuring that it shall not be compelled to receive the no longer attractive alien culture except in so far as it chooses; for the Dominant Minority with which the barbarians now have to deal will almost certainly act after its kind by seeking to impose its repudiated culture by force; and this force may perhaps be most effectively repelled by adopting and turning against the aggressor one of his own institutions (e.g., his political institution of dictatorship) or some part of his own technique (e.g., his art of war).¹

'Cette pénétration étroite de la sauvagerie et de la civilisation c'est justement ce qui fait la barbarie redoutable: des organismes humains qui ont une résistance et une détente animales; et à leur disposition pourtant l'acquis des vieilles civilisations. C'est l'histoire éternelle, les Francs n'ont pas été autre chose.'²

This disastrous miscarriage in the relations between a civilization and its primitive neighbours has been described in an illuminating passage from the pen of another modern Western scholar:

'There tends to grow up round every centre of the higher civilization a zone of lower culture which is to some extent dependent or parasitic upon its civilized neighbours, while at the same time possessing a higher degree of mobility and a greater aptitude for war. Thus to the settled Semitic civilizations of Mesopotamia and Syria and South Arabia there corresponds the predatory Nomad culture of the Bedouin, and to Egypt the pastoral culture of the Libyans and the other Hamitic peoples of North Africa. So, too, in Eastern Asia we find a similar zone of Nomad Mongolian peoples on the north-western frontiers of China, and in Central Asia the peoples of the Steppes have owed their culture to the settled civilization of Persia and Turkistan; while in prehistoric Europe the same relation existed between the peasant cultures of the Danube and the Dniepr and the warlike peoples to the north and east. . .

'It is . . . probable that it was the civilized peoples who were the first aggressors, and that it was from them that the barbarians first learnt the possibilities of organized warfare, as well, no doubt, as the

¹ A perversely ingenious barbarian instinct of self-defence sometimes even turns to military account a piece, or an instrument, of technique that the civilization from which this impromptu weapon has been borrowed has never thought of employing on its own account for any but peaceful purposes. Thus the camel, which was introduced into North Africa by the Romans as a means of civilian transport for economic objects, was converted into a means of mobility in military operations by the war-bands of the North African Nomad barbarians in the steppe and desert hinterland of the Roman dominions (see Gautier, E. F.: *Les Siècles Obscurs du Maghreb* (Paris 1927, Payot), pp. 162 and 184).

² Gautier, op. cit., p. 317.

use of weapons of metal.¹ Certainly the great wave of invasion of the men of Gutium from the north which overwhelmed Mesopotamia in the twenty-sixth century B.C. followed close upon the period of Sargon and Naramsin, who were the first to lead Mesopotamian armies into the uncivilized mountainous regions to the north and east of Tigris;² and in the same way in Egypt the later days of the Old Kingdom had been marked by expeditions of conquest against "the Sand Dwellers" of the north and the Nubians of the south, which may have helped to provoke the subsequent movement of invasion.³ However this may be, the ultimate advantage was all on the side of the barbarians; for every fresh invasion increased their warlike efficiency, whereas the destructive effects of warfare on the higher civilization⁴ were cumulative.⁵

Broadly speaking, we may say that, when a society in process of civilization has been split by the schism which is the penalty of breakdown, the Proletariat is apt to withdraw its mimesis from all the ideals of the Dominant Minority except its worship of violence, and from all its institutions and techniques except those in which this spirit of violence is embodied.

In our foregoing survey of the experiences and reactions of internal proletariats we have observed how the path of Violence allures them; and we have also seen that, when they do yield to their human passions and attempt to repay their oppressor in his own coin, they usually defeat their own ends and bring disaster upon themselves into the bargain. In his own chosen field of force the hangman-commissary of the Dominant Minority is more than a match for any members of the Internal Proletariat who may be rash enough to take up arms against him. The Theudases and Judases inevitably perish with the sword; and it is only when it follows a prophet who leads it along the path of Gentleness that the Internal Proletariat has a chance of taking its conquerors captive—by taking them unawares on an unfamiliar field of action

¹ Plato (*Leges*, 678 E) has put forward the conjecture that metallurgy, and in consequence war (both civil and international), is in abeyance in a primitive state of society—which, in Plato's view (see IV C (i), vol. iv, pp. 24-7, and IV. C (i), Annex, vol. iv, pp. 585-8, above), is a state that is perpetually recurring as an aftermath of periodical cosmic catastrophes.—A.J.T.

² For Naramsin's militarism and its nemesis see further I. C (i) (b), vol. i, p. 109, above, and the present chapter and volume, p. 262; V. C (ii) (a), vol. vi, p. 184; and V. C (ii) (b), vol. vi, p. 296, below.—A.J.T.

³ For this invasion of the Egyptian World by Asiatic barbarians in the latter days of 'the Old Kingdom', on the eve of the onset of an Egyptian 'Time of Troubles', see Part III. A, Annex II, vol. iii, p. 404, above, and the present chapter and volume, pp. 266-7, below.—A.J.T.

⁴ For the social 'law' that, while the military efficiency of a community is proportionate to the degree of its civilization, its capacity for social recuperation from the devastating effects of war is in inverse ratio both to the degree of its civilization and to the standard of its military efficiency, see the present Study, IV. C (iii) (c) 2 (β), vol. iv, pp. 393-4, above.—A.J.T.

⁵ Dawson, Christopher: *The Age of the Gods*, reissue (London 1933, Sheed & Ward), pp. 241 and 245.

on which the hangmen are inexpert and defenceless. In an ordeal by battle the Dominant Minority's victory over the Internal Proletariat is virtually assured *a priori* because its intrinsic superiority in military strength is reinforced—in dealing with this opponent—by the tactical advantage of fighting the action on a limited field on which the victor can be certain of securing a decision. We have seen, for example, in the Hellenic case, how hopeless it was for the Hellenic internal proletariat in the last two centuries B.C. to cross swords with a dominant minority whose force was not only superior in itself but was also by this time concentrated in the hands of the single ubiquitous Roman Power.¹ How do the External Proletariat's chances compare with those of the Internal Proletariat if it ventures, in its turn, to meet the Dominant Minority in battle?

The intrinsic inferiority of the External Proletariat to the Dominant Minority in military prowess is perhaps as extreme as that of the Internal Proletariat—at any rate on the morrow of the schism which has put the Proletariat and the Dominant Minority into a state of war with one another. We have convincing presumptive evidence of this in the fact—which we have observed in a previous context—that one of the regular sources of the recruitment of an Internal Proletariat lies in the conquest of members of the External Proletariat by the Dominant Minority.² In so far as they are simply subjugated instead of being annihilated or evicted, the conquered external proletarians are transferred from the External to the Internal Proletariat by the act of conquest; and this is perhaps the usual fate of those layers of the External Proletariat of a disintegrating civilization that lie nearest to the Dominant Minority's base of operations. At the same time the External Proletariat has one great advantage over the Internal Proletariat in trying conclusions with the Dominant Minority by force of arms. Whereas the whole of the Internal Proletariat lies, *ex hypothesi*, within the Dominant Minority's reach, some part, at any rate, of the External Proletariat is likely to find itself beyond the effective range of the Dominant Minority's military action—and this, again, *ex hypothesi*, since, as we have seen, the radiation of a civilization into the Barbarian World is not, as a rule, brought to a halt by any external obstacle, but runs on unimpeded until it gradually dies away through a progressive diminution of its own energy as it approaches the inherent limits of its carrying-power.

In such circumstances it is evident that, when a growing

¹ See V. C (i) (c) 2, pp. 68–71 and 180, above.

² See V. C (i) (c) 2, *passim*, above.

civilization has broken down, and when the charm exerted by a creative minority has been replaced by the Dominant Minority's substitute of violence, this radiation of force—like the radiation of attractiveness which it has superseded, and indeed *a fortiori*—must come sooner or later, as it travels out into Space, to a point that is so distant from its original place of emission that its effectiveness here dwindles to an infinitesimal quantum. In other words, even if the innermost layer of the External Proletariat succumbs to conquest, and the same fate then overtakes the next layer, or even the next after that, it is only a question of distance for an outer layer to be reached which is so remote from the Dominant Minority's base of operations that the aggressor's intrinsic superiority in military strength is here effectively counteracted by the geographical handicap. At this remove the External Proletariat will be able to take up arms against the Dominant Minority with impunity, in the assurance of being able to hold its own.

It is true that, on certain fronts, some physiographical accident may deprive the External Proletariat of this geographical advantage by compelling it to fight—as the Internal Proletariat always has to fight, if it fights at all—with its back to the wall in a confined space where the Dominant Minority can insist upon bringing it to battle and obtaining a decision. In the Hellenic World the barbarians of the Iberian Peninsula had to fight at this disadvantage against the Roman Power—by contrast with those of North-West Africa on the one side and of Transpyrenaean Europe on the other. In both these other war-zones the depth of the *terrain* which was at the barbarians' disposal for manoeuvre far exceeded the range of Rome's power to strike. On the Trans-mediterranean front in North-West Africa the Roman arm which struck down a Jugurtha in Numidia was not long enough to reach the remoter layers of Berbers in the highlands of the Atlas or on the steppes of the Sahara; and on the Transappennine front in Europe a Power which could both reach and hold the line of the Rhine could not hold the line of the Elbe or even reach the line of the Vistula.¹ In the Iberian Peninsula, on the other hand, the barbarians were trapped between the Pyrenees and the sea; and, when Caesar had finally cut them off from all communication with their Transpyrenaean kin and kind by extending the Roman hold upon Gaul from the Mediterranean slope to the coast of the Atlantic, the last of the independent Iberian barbarians, in the strong but narrow natural fastness between the crest of the Asturian and Cantabrian Mountains and the waters of the Bay of

¹ See V. C (i) (c) 3, Annex I, pp. 591-5, below.

Biscay,¹ were followed up into their lairs and reduced to subjection by Augustus—some two centuries after the date at which the first Roman soldier had set foot in the Iberian Peninsula in the course of the Hannibalic War.

In the histories of other civilizations we can think of parallel cases in which a detachment of the External Proletariat has been caught by the Dominant Minority in a geographical trap of this kind and has then been either subjugated or annihilated until, on this particular front, the victorious Dominant Minority has successfully carried its advance up to a frontier with no further layer of barbarians beyond it—a 'natural frontier' that is defined and defended by some unnavigated sea or untraversed desert or unsurmounted mountain range.

In the Indic World, for example, under the Maurya régime, the Dominant Minority subjugated the barbarians of Southern India almost up to the tip of the Indian Peninsula and thereby acquired, on this front, a natural frontier which was washed by the sea. Again, in the Sinic World under the Ts'in and Han régime, the Dominant Minority completed the subjugation of the Southern Barbarians up to the unfrequented coasts of the South China Sea and the unscaled eastern escarpment of the Tibetan Plateau.² In Russian Orthodox Christendom the backwoodsmen never gave the barbarian denizens of the north-eastern forests time to throw up a stockade. Within two hundred years of the conversion of Vladimir in A.D. 988/9 the pioneer Russian communities of Novgorod and Vyatka had pushed their way to the White Sea and the Urals; and, when the watershed between Volga and Ob had once been crossed by the Cossacks in A.D.

¹ For the part played by the Biscayan fastness, in a later age, in the collision between the Syriac Society, in its re-integrated universal state, and a nascent Western Christendom, see II. D (vii), Annex VIII, in vol. ii, pp. 446-52, above. After more than four hundred years of acquiescence in the *Pax Romana* the Basques and Cantabrians of the Biscayan highlands, like the Isaurians of the Taurus (see IV. C (iii) (c) 2 (β), vol. iv, p. 325, above), had shaken off the authority of the tottering Hellenic universal state and (unlike the Isaurians) had succeeded in maintaining their newly recovered independence. Indeed, they maintained it against successive bands of incoming barbarians—first the Vandals and Sueves and Visigoths and then the Arabs. Nor did they fall under the dominion of the Syriac universal state which the Arabs restored to life in the shape of the Umayyad Caliphate. Farther west, the Asturian highlanders submitted to the Vandals and the Sueves and the Goths, but held out against the Arabs as indomitably as their Cantabrian and Basque neighbours. Compare the tenacity of the resistance opposed by the Three Basque Provinces and Asturias to the Castilian Nationalists and their Italian and German allies in the war that broke out in Spain in July 1936. Compare, further, the survival of a primitive 'Adoptionist' version of Christianity in an Asturian fastness, where there is evidence for its persistence down to the latter part of the eighth century (see IV. C (iii) (c) 2 (β), Annex III, vol. iv, pp. 625, 629, 630, and 633, above). Compare, finally, the survival down to the present day, in the Peninsular provinces of Viscaya, Guipuzcoa, and Navarre, as well as in the adjoining districts of France on the other side of the Pyrenees, of a pre-Indo-European language which has no living counterpart on a continent on which—except in this one corner—all older linguistic strata have been buried and obliterated, centuries ago, under Indo-European and Ural-Altaic deposits.

² See V. C (i) (c) 2, pp. 141 and 147, above.

1586, it took them little more than fifty years to push on across the Siberian Taiga and Tundra to a natural frontier on the coasts of the Arctic Ocean and the Sea of Okhotsk.¹ In the Arabic World the penetration of Tropical Africa from the Saharan and Nilotic fringes of the Sudan and from the African coast of the Indian Ocean would almost certainly have been rounded off, before the close of the nineteenth century of the Christian Era, by a subjugation of the whole 'Dark Continent' if the Arab invaders had not been overtaken and supplanted, at the eleventh hour, by the more redoubtable Franks. Within the fifty or sixty years ending in 1938 the Powers of Europe had partitioned the soil, and subjugated the primitive Negro 'Natives', of the whole of Tropical Africa, from ocean to ocean and from desert to desert; and between the 12th September, 1935, when these lines were written, and the 7th August, 1938, when they were revised for the press, one of these Powers, which had received short measure in the scramble for Europe's African spoils, had broken its own engagements and had defied the verdict and the sanctions of its peers in conquering the last surviving independent Native African state; the Empire of Ethiopia.² In earlier chapters of the history of our Western World in its Modern Age the European colonists overseas kept the Red Indian barbarians on the run in North America from the moment of their first landing on the Atlantic coast of the continent until the time—some two hundred and fifty years later—when they reached their natural frontier on the shores of the Pacific;³ and in the South Seas they decimated the Australian Blackfellows and exterminated the Tasmanian aborigines until they had made themselves masters of the whole surface of both the continent and the island. Nearer home other modern militant pioneers of our Western Civilization have almost as recently made an equally 'clean job' of the White barbarians in the highlands and isles of Scotland⁴ and the bogs and mountains of Ireland; and our subjugation of these barbarians of 'the Celtic Fringe' has its analogue in the Far Eastern World in the subjugation—or

¹ See II. D (v), vol. ii, p. 157, above.

² For the Italian aggression against Abyssinia in and after A.D. 1935 see further pp. 334–7, below. For the previous history of Abyssinia see II. D (vii), vol. ii, pp. 364–7, above. In A.D. 1935 Abyssinia could accurately be described as the only surviving independent Native African state, since Liberia, which was also both African and independent, was ruled, not by Native Africans, but by the repatriated descendants of Africans who had been sold into slavery in North America. On the other hand the Amharan rulers of the Empire of Ethiopia could fairly claim to be Native Africans, in spite of the fact that their mother tongue was a Semitic language which had been brought in by conquerors from the other side of the Red Sea before the beginning of the Christian Era.

extermination—of the Ainu barbarians in the Japanese Archipelago.¹

In these and similar cases, where Geography sets bounds to the battlefield, an external proletariat which ventures to cross swords with a dominant minority has to fight at the same disadvantage—and with the same desperate prospects—as an insurgent internal proletariat. Such cases, however, are exceptional; and the normal sequel to the outbreak of war between an external proletariat and a dominant minority is not a running fight that continues until the barbarians have been eliminated by being either exterminated or subjugated up to the line of some natural frontier. While the dominant minority usually draws the first blood and cuts deep into the flesh of the surrounding barbarian body social, its arm is seldom long enough to complete the work of destruction or conquest. At a certain remove from the enemy base of operations the barbarians generally manage to make a stand and hold their own; and therewith the running fight, instead of being brought to an end by the barbarian combatant's annihilation or surrender, simply changes from a war of movement into a war of positions without passing over from war into peace.

When this stage is reached in the warfare between the Dominant Minority and the External Proletariat of a disintegrating civilization, it brings with it the completion of a change—which begins as soon as the civilization breaks down—in the nature of the geographical contact between the civilization and its barbarian neighbours. So long as the civilization is in growth, its home territory, where it prevails in full force, is insulated, as we have seen, from the unreclaimed wilderness of Savagery by a broad threshold or buffer-zone across which Civilization shades off into Savagery in a long series of fine gradations. On the other hand, when a civilization has broken down and fallen into schism, and when the hostilities between the Dominant Minority and the External Proletariat have ceased to be a running fight and have settled down into trench warfare, we find that the buffer-zone has disappeared. The geographical transition from Civilization to Barbarism is now no longer gradual but is abrupt. To use the appropriate Latin words, which bring out both the kinship and the contrast between the two kinds of contact, the *limen* or threshold, which was a zone, has been replaced by a *limes* or military frontier, which is a line that has length without breadth. Across this line a baffled Dominant Minority and an unconquered

¹ See II. C (ii) (a) 1, vol. i, pp. 229–30 and 236; II. D (v), vol. ii, p. 159; II. D (vii), vol. ii, p. 311; III. C (i) (a), vol. iii, pp. 144–5; IV. C (ii) (b) 2, vol. iv, p. 94; and V. C (i) (c) 2, in the present volume, pp. 95–6, above.

External Proletariat now face one another under arms; and this military front is a bar to the passage of all social radiation except that of military technique¹—an article of social commerce which makes for war and not for peace between those who give and take it.

The social phenomena which follow when the warfare between the Dominant Minority and the External Proletariat of a disintegrating society becomes stationary along a *limes* will occupy our attention later;² and at this point we will not anticipate our coming study of 'heroic ages' and *Völkerwanderungen* except so far as to mention the single cardinal fact that this stationary warfare along a sharply drawn line is not a stable or permanent equilibrium, but is a temporary and precarious balance which invariably ends in a barbarian break-through because, in this situation, Time works inexorably on the barbarians' side.³ The

¹ See pp. 202-3, above.

² In Part VIII, below.

³ We have already come across several illustrations of the working of this law in other contexts. We have seen, for example, how the Celtic *Völkerwanderung*, which broke upon the Hellenic World in a succession of waves between *circa* 425 and *circa* 225 B.C., was provoked by two rash and ill-sustained offensives which were launched by two Hellenic Powers against the Continental European barbarian hinterland of the Hellenic World. The first of these Celtic onslaughts, which descended like an avalanche upon Italy, was a retort to the rashness of the Etruscan maritime colonists of the Maremma in pushing their aggression against the continental barbarians right across the Appennines until the aggressors were brought to a halt along an indefensible *limes* at the foot of the Alps (see II. D (vii), vol. ii, pp. 280-1, above). The second Celtic onslaught, which was directed against Greece and Anatolia, was a similar retort to the inconsequence of Alexander the Great and his successors in diverting the whole military strength of Macedonia, first to the task of conquering the Achaemenian Empire and then to the luxury of fighting over the spoils, after Alexander's father Philip had carried the Continental European frontier of Macedonia deep into the interior of the Balkan Peninsula and had thereby saddled his kingdom with a *limes* which it would have taxed her strength to maintain—even if she had not squandered this strength in other directions (see II. D (vii), vol. ii, p. 281, footnote 1, above). We have also seen (in II. D (vii), vol. ii, pp. 344-5, and IV. C (iii) (c) 3 (α), vol. iv, p. 490, above) how the Scandinavian *Völkerwanderung* was similarly provoked by Charlemagne's rashness in carrying the *limes* of the Austrasian Empire from the right bank of the Rhine to the left bank of the Eider without having the strength or staying power to bring his offensive against the North European barbarians to a victorious conclusion by pressing on to the natural frontier of the Arctic Circle.

We may here observe in passing that the two civilizations which made these gross strategic blunders in their warfare with the European barbarians both escaped more lightly than they deserved; for, while the Etruscan and Macedonian and Carolingian *limites* were all duly broken through, the Celtic and Scandinavian counter-attacks were abortive. The common reason for their failure was that they were all made at a time when the civilization which they were attacking still had forces in reserve. The Hellenic Civilization and the Western Civilization were still each in their growth-stage at the respective times when the Celtic counter-offensive was opened and when the Scandinavian counter-offensive was delivered; and in the Hellenic World the Roman Power took its stand in the breach through which the Etruscans and the Macedonians had allowed the Celts to pass (see II. D (v), vol. ii, pp. 160-4, above), while in Western Christendom the Scandinavians, with whom the Carolingians had failed to cope, were brought to a halt, within a hundred years of the first Viking raid, by the rising Powers of Wessex and France (see II. D (v), vol. ii, pp. 194-202, and II. D (v), Annex, vol. ii, p. 401, above).

On the other hand the Iranic World paid the full penalty for Timur Lenk's inconsequence in diverting the energies of Transoxania to the conquest of her sedentary neighbours before he had carried to completion his brilliant feat of using Transoxanian arms to harry the Eurasian Steppe and to break the power of the Nomads (for Timur's career

explanation of this 'law' that will be found to govern the history of the *limites*, or anti-barbarian military frontiers, of disintegrating civilizations is not essential to our immediate purpose, which is simply to bring the External Proletariat on to the stage; and this inquiry can therefore conveniently stand over until the time comes for giving the actor his cue to play out his part. Our first task is to muster the External Proletariat in as large an array of examples as we can contrive to collect by making an empirical survey; and in this survey, as before, we will begin by examining the Hellenic instance.

A Hellenic Instance.

The growth-phase of Hellenic history is rich in illustrations of the *limen* or buffer-zone with which the home-territory of a healthily growing civilization tends to surround itself.

Towards Continental Europe the quintessence of Hellas shaded off, north of Thermopylae, into a semi-Hellenic Thessaly, and, west of Delphi, into a semi-Hellenic Aetolia; and Aetolia and Thessaly, in their turn, were insulated by the demi-semi-Hellenism of Epirus and Macedonia from the undiluted barbarism of Illyria and Thrace.¹ None of these gradations was so brusque or precipitous as to be impassable; for even on the Thracian border, where the Macedonian backwoodsmen extended the bounds of Hellenism by annihilating the barbarian Eordaei and evicting the barbarian Pieres and Bottiaei,² these methods of barbarism were perhaps less characteristic of the propagation of the Hellenic Civilization than the way of Orpheus, the legendary prophet and minstrel whose music captivated barbarian hearts and whose spiritual conquests were sealed by his martyrdom.³

see II. D (v), vol. ii, pp. 144-50, and IV. C (iii) (c) 3 (α), vol. iv, pp. 491-5, above). The retort was the Uzbeg Nomad invasion of Transoxania at the turn of the fifteenth and sixteenth centuries of the Christian Era; and this barbarian counter-attack was never effectively met; for at that critical moment the Iranic Civilization broke down and the forces which it still had in reserve were diverted, in their turn, from the urgent common task of dealing with the barbarian enemy, and were expended instead in the fratricidal warfare between the Sunnah and the militant Shi'ism of Ismā'il Shāh Safawī (see I. C (i) (b), Annex I, vol. i, pp. 366-400, above).

We have still to observe (see the present chapter and volume, pp. 284-8, below) that the responsibility for provoking the Scandinavian Völkerwanderung was shared with Charlemagne by contemporary Khazar Nomad empire-builders on the Great Western Bay of the Eurasian Steppe, with consequences for Khazaria which were as disastrous as those which Transoxania and Etruria brought upon themselves by committing the same strategico-political error in their dealings with their own respective barbarian hinterlands.

An abortive Egypto-Ottoman expansion in the Sudan in the nineteenth century of the Christian Era, which evoked a Baggara Arab Nomad counterstroke before that century reached its close, is also noticed in the present chapter and volume, pp. 294-5, below.

¹ For this semi-Hellenism and demi-semi-Hellenism of Northern Continental Greece in the growth-phase of Hellenic history see III. C (ii) (b), Annex IV, vol. iii, p. 478, above.

² Thucydides, Book II, chap. 99.

³ For the mythical figure of Orpheus as a type of the creative minority of a civilization in its growth-stage see IV. C (iii) (a), vol. iv, p. 123, above. For the historical higher

Towards Asia Minor, again, the quintessence of Hellas shaded off likewise, in the hinterland of the Aeolian and Ionian and Dorian and Lycian city-states of the Asiatic seaboard, into the semi-Hellenism of Caria and the demi-semi-Hellenism of Lydia, before passing over into the barbarism of the Thracian interlopers—Mysians, Phrygians, and the like—who had squatted among the ruins of the Hittite Civilization on the Anatolian Plateau. On this Asiatic border we see Hellenism taking its barbarian conquerors captive, Orpheus-fashion, for the first time in the full light of history. The spell was so strong that, in the second quarter of the sixth century B.C., the conflict between Philhellenes and Hellenophobes came to the forefront of Lydian politics; and even when a Philhellene aspirant to the Lydian throne—the Ionian queen's son Pantaleon—was worsted by his half-brother the Carian queen's son Croesus,¹ the protagonist of the anti-Hellenic party proved so impotent to swim against the pro-Hellenic tide that he became famous for being as generous a patron of Hellenic shrines as he was a credulous consultant of Hellenic oracles.

Even in the hinterlands of the Greek colonies overseas, where the cultural gulf between Hellenism and barbarism might have been expected to be wider and the political relations between the two worlds proportionately more hostile, peaceful relations and gradual transitions appear to have been the rule. The enslavement of the Anatolian Mariandyni by the Greek founders of Heraclea Pontica seems to have been as exceptional a barbarity in the overseas Hellenic World as the enslavement of the Messenians by the Spartans was in Hellas Proper; and the extermination of the Itali² and the Chônes, in the 'toe' of the Italian Peninsula, by the makers of Magna Graecia, is the only overseas analogue of the extermination of the Eordaei by the Macedonians.³ The barbarians of the hinterland were sometimes brought under the political suzerainty of the colonial Greek city-states. In Sicily,

religion of Orphism see I. C (i) (b), vol. i, pp. 95–100, and V. C (i) (c) 2, in the present volume, pp. 84–7, above.

¹ See Herodotus, Book I, chap. 92.

² It is one of the curiosities of history that this small and obscure people, which was wiped out of existence before it had had time to bequeath anything to Posterity except its name, should eventually have conferred this name upon a territory extending from the 'toe' of Italy, in which the Itali had their home, to the distant summit of the Alps. In the history of the latter-day expansion of our own Western Society we may compare the capricious and ironic preservation of a few vestiges of the names, and fragments of the languages, of the extinct Red Indian 'Natives' of North America in the outlandish nomenclature of the states and the provinces, the cities and the rivers, of the United States and Canada: Massachusetts and Saskatchewan, Chicago and Winnipeg, Ottawa and Mississippi. Apart from these incongruous memorials, 'the names they bore in common are forgotten, their language perishes, and all traces of their origin disappear. Their nation has ceased to exist, except in the recollection of the antiquaries of America and a few of the learned of Europe' (de Tocqueville, A.: *Democracy in America*, English translation, new edition (London 1875, Longmans, Green, 2 vols.), vol. i, p. 345).

³ For the element of violence in the overseas expansion of the Greeks in this age see I. B (ii), vol. i, p. 24, II. D (ii), vol. ii, pp. 42–3, and III. C (ii), vol. iii, p. 121, above.

for example, Syracuse and Agrigentum each established a miniature empire over the neighbouring native Sicilian communities. But there are at least as many examples of *ententes* like that between the Greek colony of Cyrene and the local Libyans, or alliances like that which was eventually established between the Greek colony of Tarentum and the Messapians in the 'heel' of Italy. And, underlying this diversity of political relations, there is a striking uniformity, on the cultural plane, in the peaceful penetration of the interior by Hellenism. In Sicily in the last century B.C., less than five hundred years after the foundation of the latest Greek colony on Sicilian soil, it would have been impossible (as will be apparent to any reader of Cicero's *Verrines*) any longer to distinguish the descendants of native Sicels from those of Greek Siceliots in a population which had long ago been unified by its common Hellenic culture, its common Greek speech, and its common sufferings under Roman misrule.¹ In the Continental Italian hinterland of Tarentum Hellenism spread so rapidly, and 'took' so strongly, among the Illyrian-speaking peoples between the tip of the 'heel' and the 'spur' of Monte Gargano that, as early as the fourth century B.C., Apulia advertised her conversion to Hellenism by becoming the busiest (though not the most exquisite) workshop for the production of red-figure vases. Still farther afield the Sicels' continental kinsmen in Latium took so heartily to the exotic Hellenic institution of the city-state that Greek observers accepted the Latins as Hellenes by adoption.² The earliest mention of Rome in extant literature is a notice, in a surviving fragment of a lost work from the hand of Plato's pupil, Heracleides Ponticus, in which this Latin commonwealth is described as 'a Hellenic city';³ and we have seen already⁴ how Rome earned this compliment by spreading at any rate the political elements of Hellenic culture from the Latin Campagna⁵ into the Sabine and Picentine highlands.

Thus, on all the fringes of the Hellenic World in its growth-stage, we seem to see the same gracious figure of Orpheus casting his spell upon the barbarians round about, and even inspiring

¹ For a sketch of the Janus-face of the Philhellene-Hellenophobe Sicel leader Ducetius see V. C (ii) (a), vol. vi, pp. 235-6, below.

² See IV. C (i), vol. iv, pp. 19-20, and V. C (i) (c) 1, in the present volume, p. 55, with footnote 4, above.

³ 'A faint and blurred report of the bare event of the catastrophe which Rome suffered in being captured [by the Gauls *circa* 390 B.C.] does appear to have penetrated at the time to Hellas; for Heracleides Ponticus, whose own date is not so very much later, mentions, in his treatise on the Soul, the currency of a story from the West to the effect that a host had burst in from the outer darkness of the land of the Hyperboreans and had captured a Hellenic city called Rome (πόλις Ἑλληνίδα Ῥώμην) which lay at the back of beyond, somewhere in the direction of the Atlantic (ἐκεῖ που κατὰ κλημένην περὶ τὴν μεγάλην θάλασσαν).—Plutarch: *Life of Camillus*, chap. 22.

⁴ In IV. C (iii) (c) 2 (β), vol. iv, pp. 310-13, above.

⁵ For the history of the name Campagna see II. D (i), vol. ii, p. 19, footnote 1, above.

them to rehearse his magic music, on their own simpler lyres, to the ruder peoples of the farther hinterland.¹ This idyllic picture vanishes, however, in a trice upon the Hellenic Civilization's breakdown. As the harmony breaks into a discord, the spell-bound listeners seem to awaken with a start; and, relapsing into their natural ferocity, they now hurl themselves—with more excuse than there ever was for their womenfolk's legendary assault upon the authentic Orpheus—against the sinister man-at-arms whom they have caught masquerading under the gentle prophet's cloak.

The first move in a thousand years' war between barbarians and Hellenes was made, in Orpheus' own Thracian mission-field, in the third year of the Hellenic civil war of 431-404 B.C., when Sitalces the Odrysian invaded and harried Macedonia and put all the Hellenes in a tremor from the Strymon to Thermopylae.² Sitalces' raid was abortive; and, although the voluntary self-Hellenization of Thrace was checked and blighted from that time onwards, Hellas had little further serious trouble with this obstinate Thracian outpost of barbarism at her gates during the four hundred and seventy-four years of cultural stalemate that followed on this front, from 429 B.C. to A.D. 46, before the Odrysian Kingdom was converted into a Roman province, in order to be Hellenized by force, in the reign of the Emperor Claudius (*imperabat* A.D. 41-54). The militant reaction of the external proletariat to the breakdown of the Hellenic Civilization was both more violent and more effective in Magna Graecia, where the Bruttians and Lucanians now began to avenge the Chônes and the Itali by entrenching themselves in their extinct barbarian predecessors' desolate fastnesses and insinuating themselves, like hermit crabs, into one Italiot Greek city after another.

Within less than a hundred years after the outbreak of the

¹ On the political plane we can watch the gradual and spontaneous spread of republicanism at the expense of monarchical institutions from the city-states of Hellas Proper, where monarchy is already obsolete at the earliest date to which our surviving records reach back, to the seaboard of Epirus by 430 B.C. (see III. C (ii) (b), Annex IV, vol. iii, p. 478, above); to the Paeonian and Thracian peoples of the Lower Strymon Valley by 383 B.C. (see III. C (ii) (b), Annex IV, vol. iii, p. 483, above); to the Romans at some date unknown which was perhaps earlier than either of these; and to the peoples of Gaul (with the exception of the Belgae) before the time of Caesar's conquest. By the time when Tacitus was writing his *Germania*, the wave of republicanism had travelled on into the German zone of barbarism; and at this date the primitive form of kingship was definitely on the wane—even beyond the Rhine—among the Frisians and the Cherusci. Among the Suebi, however, it was still holding its own; and among the Goths and, above all, the Swedes, it was still intact (Chadwick, H. M.: *The Origins of the English Nation* (Cambridge 1907, University Press), pp. 298-9). For the subsequent replacement of both the adoptive republicanism and the indigenous monarchical institutions of the North European barbarians beyond the Roman pale by a new military despotism, which was one of the products of the barbarians' reaction to the challenge of the Roman *limes*, see V. C (i) (d) 7, vol. vi, p. 4, footnote 4; V. C (ii) (a), vol. vi, pp. 228-36; and Part VIII, below.

² See Thucydides, Book II, chap. 101.

Atheno-Peloponnesian War, which was the 'beginning of great evils for Hellas',¹ the few remaining survivors among the formerly prosperous and powerful communities of Magna Graecia were summoning knight-errants—or condottieri—from the mother-country to save them from being driven into the sea.² And these erratic reinforcements were of such little avail for stemming the Oscan tide that the inflowing barbarians had already crossed the Straits of Messina and acquired, in that city itself, a base of operations for the conquest of Sicily before the whole movement was brought to an abrupt end by the intervention of the Oscans' Hellenized Roman kinsmen. The Romans showed themselves to be more discerning, as well as more effective, champions of Hellenism in Italy than their discomfited Epirot adversary Pyrrhus. The Epirot knight-errant had sought to save the mere political independence of Magna Graecia—at the expense of the Hellenism which it was Magna Graecia's mission to propagate beyond her borders—by making common cause with the barbarian enemies at the Italiot Greek cities' gates against the most Hellenic of all the native Powers of Italy; Roman statesmanship saved not merely Magna Graecia but the whole Italian Peninsula for Hellenism by taking the Oscans in the rear, attacking these now inveterate barbarians in overwhelming force, and imposing a common Roman peace upon Italian barbarians and Italiot Greeks.

Thus the South Italian front between Hellenism and barbarism, on which Hellenism had been fighting a losing battle in the fourth century B.C.,³ was suddenly wiped out in the third century B.C. by the Romans' master-stroke; and thereafter successive feats of Roman arms extended the dominion of the Hellenic dominant minority almost as far afield in Continental Europe and the Iberian Peninsula and North-West Africa as it had already been extended in Asia by the conquests of Alexander of Macedon.⁴ But these Macedonian and Roman conquests could not, and did

¹ Thucydides, Book II, chap. 12, quoted in IV. C (ii) (b) 1, vol. iv, p. 62, above.

² For these knight-errants see IV. C (iii) (c) 2 (β), Annex I, vol. iv, pp. 589-91, above.

³ The Oscan barbarian counter-attack, which did not begin earlier than the fourth century B.C. in Magna Graecia, had begun before the end of the fifth century B.C. in Campania; but in the Campanian field the breakdown by which the counter-attack was evoked was not the general breakdown of the Hellenic Society—which may be dated from the outbreak of the Atheno-Peloponnesian War in 431 B.C.—but the earlier local breakdown of the Hellenized Etruscan settlers on the west coast of Italy, who had been as rash in pushing their way inland from the Campanian stretch of the Italian coast as they had been, on a larger scale, farther north. The advancement of the Etruscan *limes* in Campania to the south-western foot of the Abruzzi produced as provocative an effect upon the Oscan highlanders as was produced upon the Celts by the contemporary advancement (discussed in II. D (vii), vol. ii, pp. 280-1, and in the present chapter and volume, p. 209, footnote 3, above) of the other Etruscan *limes* in the Po Basin to the foot of the Alps.

⁴ See III. C (i) (a), vol. iii, pp. 140 and 150-1; III. C (i) (d), vol. iii, p. 197; IV. C (iii) (c) 2 (α), vol. iv, p. 265, and IV. C (iii) (c) 2 (β), vol. iv, pp. 305-6, above; and V. C (ii) (b), vol. vi, pp. 289-90, below.

not, relieve a disintegrating Hellenic Society from a social malady that was one of the unescapable penalties of its breakdown. The effect of this morbid military expansion of the Hellenic World was not to eliminate its anti-barbarian fronts but rather to add to their length as it pushed them farther afield from the Hellenic dominant minority's bases of operations; and this progressive lengthening of the lines of communication, as well as of the front itself, diminished the dominant minority's striking power while increasing its commitments.

In another context¹ we have already observed how Rome's very success in stepping into the breach and taking over the Etruscans' commitments against the Celts and the Tarentines' commitments against the Oscans and the Macedonians' commitments against the Thracians and Dardanians led her on, inexorably, step by step, into assuming the sole responsibility for the maintenance of an anti-barbarian front that ran across the whole length of the European Continent from the North Sea to the Black Sea coast² and thus brought the Hellenic Society into a direct and hostile contact with the formidable Eurasian Nomads in the Hungarian Alföld and the Lower Danube Basin, as well as with the sedentary European barbarians in the Teutoberger Wald and the Hercynian Forest and Transylvania. Moreover this vast extension and aggravation of an anti-barbarian front which the disintegrating Hellenic Civilization had inherited from its own past was only part of the additional burden which an ailing society was wantonly taking upon its shoulders; for simultaneously the Hellenic dominant minority was taking over no less than four other anti-barbarian fronts from a Syriac Society which had been forcibly incorporated into the Hellenic World by the Macedonian and Roman wars of conquest.

From an annihilated Carthage Rome inherited one anti-barbarian front in the Iberian Peninsula and another in Numidia, while from a ham-strung Seleucid Monarchy,³ which was itself the Hellenic heir of the Achaemenian Empire, Rome also inherited the task of defending South-Western Asia against assaults both from the Eurasian Nomads who were always ready to pour in through the gateway between the Caspian and the Pamirs⁴ and from the Afrikan Nomads of the Arabian Peninsula whose grazing-fleets were always cruising expectantly off the desert-coast of Syria with an eye to turning pirates at any favourable

¹ In II. D (v), vol. ii, pp. 161-4, above.

² This European frontier of the Roman Empire is discussed in V. C (i) (c) 3, Annex I, pp. 591-5, below.

³ A board of Roman commissioners did literally ham-string the Seleucid stud of war-
elephants at Apamea in 162 B.C. (see V. C (i) (d) 9 (y), vol. vi, p. 122, footnote 5, below).

⁴ For this gateway see Part III. A, Annex II, vol. iii, pp. 400-1, above.

opportunity.¹ It is true that Rome did not have to carry all these additional burdens to the end of her days; for, as we have seen,² she succeeded, in Augustus's day, in wiping out the front in the Iberian Peninsula, as she had wiped out the front in Southern Italy before the outbreak of the first of the Romano-Carthaginian wars; and in Asia the flood-waters of Eurasian Nomadism, which had spread from the line of the Jaxartes to the line of the Euphrates in the second century B.C.,³ evaporated in the third century of the Christian Era when the Nomad Power of the Parthians was ignominiously suppressed by the resurgent Syriac Empire of the Sasanidae.⁴ In this latter case, however, the net weight of the burden which Rome had to carry was not diminished, but on the contrary was heavily increased, when the barbarian King Log who had been sitting so inertly on the throne at Ctesiphon was suddenly supplanted by a Syriac King Stork with a mission to wage an anti-Hellenic 'Holy War';⁵ and the series of Romano-Sasanian wars of ever-increasing frequency and intensity which occupied the next four hundred years eventually exhausted the belligerents to a degree that left them impotent to prevent the Arab barbarians from breaking out in the seventh century of the Christian Era and overwhelming them both.⁶

This four-hundred-years-long struggle between the Roman and Sasanian Empires, and between the civilizations which they respectively embodied, will call for examination later on in other contexts.⁷ In this place we are concerned only with the anti-barbarian fronts of the disintegrating Hellenic Civilization; and we will confine our attention to four which had a continuous existence from the turn of the third and second centuries B.C.—when Rome 'knocked out' all the other Great Powers of the contemporary Hellenic World and thus acquired a monopoly of all the assets and liabilities of the Hellenic dominant minority—down to the interregnum (*circa* A.D. 375–675) which followed the break-up of the Roman Empire at the turn of the fourth and fifth centuries of the Christian Era. The four fronts in question are the front against the sedentary barbarians of Continental Europe from the North Sea coast to Transylvania;⁸ the front against the

¹ See Part III. A, Annex II, vol. iii, pp. 412 and 445, above.

² In the present chapter, pp. 205–6, above.

³ See pp. 239–40, below.

⁴ See p. 240, below.

⁵ For the disastrous effect of this Sasanian militancy upon the fortunes of the Zoroastrian Religion see V. C (i) (d) 6 (δ), Annex, pp. 659–61, below.

⁶ This nemesis of a common Militarism did not, however, fall upon the two warring empires with equal weight; for, while the Sasanian Empire was utterly destroyed, its Roman antagonist escaped with its life at the cost of losing its limbs (see Part III. A, Annex II, vol. iii, p. 450, and V. C (i) (c) 2, in the present volume, p. 128, above).

⁷ For example, in Parts IX and XI, below.

⁸ This Continental European front had an insular extension in the British Isles which

Eurasian Nomads (and the Nomadicized sedentary intruders upon the Nomads' ranges)¹ in the Lower Danubian bay and the Middle Danubian enclave of the Great Eurasian Steppe; the front against the barbarians in the interior of North West Africa (Nomads on the Sahara and highlanders in the Atlas); and the front against the Arabs beyond the desert-coast of Syria who constituted the Asiatic wing of the Afrasian Nomad forces.

When we compare the military annals of these four fronts during the span of some nine hundred years (*circa* 225 B.C.—A.D. 675) over which their history extends from first to last we find that there is a close chronological correspondence between the respective alternating bouts of military activity and relatively

we will pass over in our present survey since we have already dealt with it in our study of the abortive Far Western Christian Civilization (see II. D (vii), vol. ii, pp. 322-40, and II. D (vii), Annexes II, III, and IV, in vol. ii, pp. 420-33, above).

¹ For the alternation between the Nomads' eruptions and the sedentary societies' encroachments in the exposed salients and detached enclaves of the Steppe see Part III. A, Annex II, vol. iii, pp. 425-8, above. The ex-sedentary North European barbarian intruders upon the western fringes of the Eurasian Steppe who played a historic role in the history of the disintegration of the Hellenic Civilization were the Goths, who made themselves at home on the Steppe in the third century of the Christian Era during an interval of quiescence between the subsidence of the Sarmatian Nomad eruption and the outbreak of the Hun Nomad eruption. During the century and a half of their residence on Nomad territory the Goths were nomadicized profoundly—and this in their *éthos* as well as in such external things as their art of war (for the adoption, by these sedentary interlopers, of the Sarmatian Nomad cataphracts' equipment and tactics see IV. C (iii) (c) 3 (α), vol. iv, pp. 439-44, above). The extent of their conversion from a sedentary form of barbarism to the Nomadic culture can be measured by the difference between their subsequent history and that of their kinsmen the Franks: a sedentary North European barbarian people who had not ventured out of their native forest on to the Steppe and who had therefore not acquired any tincture of the Eurasian Nomad Civilization. When the collapse of the Roman Power gave the signal for both Franks and Goths to break through the Roman *limes* and begin their *Völkerwanderung*, the Goths responded with an initial brilliance which threw the Franks quite into the shade. Within less than half a century after their passage of the Lower Danube on sufferance, as suppliant refugees who were fleeing before the face of the Huns and were throwing themselves on the Roman Government's mercy (see IV. C (iii) (c) 3 (α), vol. iv, p. 440, footnote 4, above), the Visigoths had entered the Imperial City itself as conquerors and had then swept on to carve out an appanage for themselves at the farthest extremity of the Empire, on the Gallic shores of the Bay of Biscay. By the close of the fifth century the Visigoths had made themselves masters of the whole of Gaul south of the Loire and west of the Rhône, together with the whole of the Iberian Peninsula except the north-west corner and the highland hinterland of the Biscay coast (see p. 206, footnote 1, above), while the Ostrogoths, following at their heels, had secured the still choicer prize of Italy, together with the Western Illyricum. In the year A.D. 500 it looked as if the Goths had won for themselves the lion's share of the Roman heritage; but at this point in a hitherto brilliant career they began to show that fatal lack of staying-power, and that incurable inability to strike root, which are characteristic, as we have seen (in Part III. A, vol. iii, pp. 22-5, above), of the Nomad conqueror *in partibus agricolarum*. When the Visigoths, who had fought their way from the Baltic to the Black Sea and from the Black Sea to the Mediterranean and the Atlantic, collided at Vouillé, in A.D. 507, with the Franks, who had taken as long a time to advance from the right bank of the Rhine to the right bank of the Loire, it was the Franks and not the Goths that won the day (see II. D (v), vol. ii, p. 166; II. D (vii), vol. ii, p. 380; and II. D (vii), Annex IV, vol. ii, p. 428, above); and the ruin of the Goths was completed when the Ostrogoths were exterminated in the Great Romano-Gothic War of A.D. 535-52, and when the half of the Visigothic Kingdom which the Franks had spared in A.D. 507 was overwhelmed in A.D. 711 by the Arabs. This ultimate political failure of the Goths has, however, brought with it a literary reward which has been withheld from the Franks by their ultimate political success. It is the unsuccessful Goths, and not the successful Franks, that have provided a fruitful theme for 'heroic' poetry (see V. C (i) (c) 3, Annex III, pp. 610 and 613, below).

peaceful stagnation on each of them;¹ and in this uniform rhythm we can discern three periods of storm and stress in which the barbarians attempted to break through—on the first two occasions in vain, but the third time with success.

At the height of the Hellenic 'Time of Troubles' during the last two centuries B.C.² we find the Sarmatian barbarians advancing from the east bank of the Don to new ranges in the Lower and the Middle Danube Basin, where they hovered menacingly on the north-eastern flank of the Hellenic World from that time onwards. Contemporaneously, at the turn of the second and the last century B.C., the Arabs³ drifted into the derelict domain of a moribund Seleucid Monarchy in Mesopotamia and Syria. On the North-West African front the Numidians took advantage of the overthrow of Carthage in the Hannibalic War and her annihilation in 146 B.C. in order to encroach upon the derelict Carthaginian province on the African mainland. And last of all, on the North European front, the first extension of the Roman rule into Transalpine Europe—into Gaul on one side and into Noricum on the other—towards the close of the second century B.C. was answered by the formidable counter-attack of the Cimbri and the Teutones, who bore down on Italy itself along war-paths that were now no longer blocked by the semi-barbarian buffer Powers which had just been crippled or shattered by Roman arms. On three fronts out of the four the Romans found themselves compelled to intervene in order to bring the barbarian offensives to a standstill; and on the North European front they had to fight for their lives—even in this first of the three historic paroxysms of barbarian aggression. In Europe and in Africa the situation was saved by Marius, who snatched victory out of defeat in the war against the Numidian aggressor Jugurtha (*gerebatur* 112–106 B.C.) and in the war against the Cimbri (*gerebatur* 105–101 B.C.).⁴ In Asia the last remnant of the Seleucid heritage was salvaged from the depredations of the Arab war-bands by Pompey when he organized

¹ In order to make the comparison in equivalent terms for all fronts, we have to allow for the possible intervention of a climatic factor—an alternating rhythm of humidity and aridity on the Steppes—on those fronts on which the transfrontier barbarians were Nomads. The question whether a climatic factor of this nature is one of the causes of the occasional eruptions of the Nomads out of their own domain on the Steppes into the adjoining domain of the sedentary societies round about them has been discussed in Part III. A, Annex II, vol. iii, above.

² It should be noticed that this critical period in the disintegration of the Hellenic Civilization partly coincided in date—if we are to accept the theory of climatic pulsations—with a bout of aridity on the Steppes which lasted from *circa* 225 B.C. to *circa* A.D. 75. In view of this coincidence we may find ourselves at a loss to determine, in the case of the Nomads, whether their movements of aggression against the Hellenic World between these dates were produced by a social pull or by a climatic push.

³ See p. 215, above.

⁴ For the stimulus which was given to the organization and technique of the Roman Army by these Marian wars against the barbarians of Africa and Europe see III. C (i) (b), vol. iii, p. 166, and IV. C (iii) (c) 2 (γ), vol. iv, p. 439, above.

the Roman province of Syria in 63–62 B.C. Thereafter, when a band of Suevi—undeterred by their Cimbrian cousins' and predecessors' recent fate—set their feet upon the same European war-path, Caesar jumped at the opportunity of improving the Transalpine frontier of the Roman dominions by carrying it (*bellum gerebat* 58–51 B.C.) up to the line of the Rhine, on which it continued to stand, with a few brief fluctuations, for the next four centuries.

The second abortive attempt, on the barbarian side, at a breakthrough on all four fronts was made in the middle of the third century of the Christian Era, when the Roman Empire suddenly tottered—and then almost as suddenly recovered itself¹—like a man who has been smitten by a first paralytic stroke in a late but still vigorous middle age. This time it was the Eurasian, and not the North European, front that was subjected to the heaviest pressure. On this front in this crisis the Goths not only thrust their way overland across the Lower Danube into the heart of the Balkan Peninsula, but also took to the water and harried the coasts of the Black Sea and the Aegean. On the Arabian front the tribesmen likewise returned to the attack—this time under the leadership of the oasis-dwellers of Palmyra²—and, thus led and organized, they momentarily overran not only Syria but Egypt and Anatolia as well. In North-West Africa the Berbers once more went on the war-path for the first time since Jugurtha's day. On the North European front the Franks and Alemanni now crossed the Rhine and treated themselves to a taste of the flesh-pots of Gaul. In this second paroxysm of simultaneous concentric barbarian attacks the Roman Power succeeded in saving the situation once again. The death of the Emperor Decius (*imperabat* A.D. 249–51) at the hands of the Goths was avenged by the Emperor Claudius Gothicus (*imperabat* A.D. 268–70). The blow which Zenobia had dealt to Roman prestige was effaced when the audacious Palmyrene princess was led in triumph through the streets of Rome behind the chariot of Aurelian. The Berbers were cleared out of the African provinces, and the Germans out of Gaul. In fact, all the broken fronts were for the second time restored; but this time the victory had been preceded by heavier reverses and deeper humiliations; it had been purchased at a higher price; and it had only superficially restored the *status quo ante*; for, while the old frontiers had been re-established (except in Swabia and in Transylvania), the relative strength of the Roman and barbarian forces had been permanently changed in the barbarians' favour.

¹ For this temporary collapse of the Empire see IV. C (i), vol. iv, p. 8, above, and V. C (i) (d) 6 (8), Annex, in the present volume, p. 649, and V. C (ii) (b), vol. vi, p. 284, below. For the Illyrian soldiers who set the Empire on its feet again see V. C (ii) (a), vol. vi, p. 207, below. ² For the history of Palmyra see II. D (i), vol. ii, pp. 9–12, above.

We are thus prepared for the decisive success of the third barbarian offensive, which began in the last quarter of the fourth century of the Christian Era and was kept up, on this front or on that, for some three hundred years (*circa* A.D. 375-675).¹

This time, again, the action opened on the Eurasian front, where the eruption of the Hun Nomads blew the nomadicized Goths right off the Steppe into the far interior of the Roman body politic—as rocks and trees are uprooted and hurled through the air by an exploding shell.² From the end of the fourth century to the end of the sixth the pressure continued to be heavier on this front than on any other, as the ebb of the Hun wave was followed by the onrush of the Avar wave, and the vacuum left by the violent propulsion of the Goths was filled by the gentle infiltration of the Slavs.³ It was only in the seventh century, when the onslaughts of pagan Huns and Avars were outmatched by the demoniac outbreak of the Muslim Arabs, that the main pressure shifted from the Eurasian front to the Arabian.

The organized and purposeful military campaigns of the Muslim Arabs were very different from the half automatic and barely conscious pressure of their ancestors against the yielding desert-frontier of a decaying Seleucid Empire in the second and the last century B.C. They are more comparable to the momentary Arab occupation of the Syrian, Egyptian, and Anatolian territories of the Roman Empire under Palmyrene leadership in the third century of the Christian Era.⁴ But they utterly surpassed both these anticipatory reconnaissances in the potency of their driving-force.⁵ While the Arab encroachments in the last two centuries B.C. had got no farther than the line of the Lebanon and the Orontes,⁶ and the momentary Palmyrene conquests in the third century of the Christian Era had come to a halt at the banks of the Nile and of the Black Sea Straits, the Muslim Arab conquerors penetrated as

¹ In attempting to account for the movements of the Nomads between these dates, it has to be borne in mind that the interregnum which followed the dissolution of the Hellenic Civilization coincided in time—and this even more closely than the Hellenic 'Time of Troubles' (see p. 218, footnote 2, above)—with a bout of aridity on the Steppes (if the theory of climatic pulsations is to be accepted). For this hypothetical bout of aridity *circa* A.D. 375-675 see Part III. A, Annex II, vol. iii, p. 414, above.

² See Part III. A, Annex II, vol. iii, p. 426, above.

³ See II. D (vii), vol. ii, pp. 317-19, and IV. C (iii) (c) 2 (β), vol. iv, pp. 327-8 and 397-8, above, and V. C (ii) (a), vol. vi, pp. 224-5, below.

⁴ This comparison has been made already in I. C (i) (b), vol. i, p. 74, footnote 4, and in Part III. A, Annex II, vol. iii, pp. 397-8, above.

⁵ This immense superiority, in potency, of the third of the three Arab offensives against the Hellenic World was almost certainly due to the most conspicuous of its distinctive features: that is to say, to the fact of its having been launched under the auspices of Islam. For the effect of alien religious influences—such as the Jewish and Christian influences that went to the making of Islam—in precipitating eruptions of Nomads see Part III. A, Annex II, vol. iii, pp. 450-1, above.

⁶ See Jones, A. H. M.: *The Cities of the Eastern Roman Provinces* (Oxford 1937, Clarendon Press), pp. 255-6.

far as their Palmyrene predecessors towards the north-west, while on the south-west they left them far behind. In Asia Minor the Constantinopolitan Government succeeded—at the price of abandoning its commitments and cutting its losses on all other fronts—in pushing the Muslim Arabs back from the line of the Straits to the line of the Taurus and holding them there at the cost of grievously overstraining and fatally deforming the nascent body social of Orthodox Christendom.¹ In Africa, however, the wave of Muslim Arab conquest swept on from the Nile to the Atlantic—meeting and overpowering and carrying along with it the lesser wave of Berber aggression which was at that time breaking, likewise for the third time, upon the remnant of the African domain which Rome had inherited from Carthage.

At the Straits of Gibraltar the united Arab and Berber wings of the Afrasian Nomad forces collided with the epigoni of the Visigoths, who had settled down in the Iberian Peninsula at the end of a *Völkerwanderung* which had carried them across the whole breadth of the Roman Empire from a starting-point on the Great Western Bay of the Eurasian Steppe.² When these Gothic pupils of the Eurasian Nomads now encountered the Afrasian Nomad invaders of the Roman Empire at a point on the Empire's extreme western verge which was almost equally remote from the original mustering-grounds of both the rival war-bands, it was the Afrasian Nomadism that was victorious;³ for the united Arab-Berber forces were not flung back from the Straits of Gibraltar by Roderick in A.D. 711 as the Arabs were flung back from the Bosphorus by Constantine IV in A.D. 677 and again in A.D. 718 by Leo Syrus. Scattering the Goths like chaff, the Arabs and Berbers pressed on across the Pyrenees and reached the banks of the Rhône and the Loire before they collided with the Franks and fared as ill at their hands in A.D. 732 on the road to Tours⁴ as the ancestors of the Arabs' discomfited Gothic adversaries had fared at the same Frankish hands at Vouillé in A.D. 507.⁵ It was characteristic of the heavy-footed gait⁶ of the sedentary North European barbarians that, at dates which were two hundred and twenty-five years apart, they should win their successive victories over their mobile rivals from the Ukraine and the

¹ See II. D (vii), vol. ii, pp. 367-9; IV. C (iii) (c) 2 (β), vol. iv, pp. 321-2, above.

² For the *Völkerwanderung* of the Goths see p. 217, footnote 1, above.

³ The victory of the Afrasian Nomads over the Visigothic representatives of the Eurasian Nomadism at Xeres, on the Iberian threshold of Europe, in A.D. 711, has the same piquancy as the victory of the Indian over the African elephants at Raphia, on the Egyptian threshold of Africa, in 217 B.C.

⁴ See II. D (v), vol. ii, pp. 203-4; II. D (vii), vol. ii, pp. 361-2 and 378-81; II. D (vii), Annex IV, vol. ii, pp. 427-33; and IV. C (iii) (c) 2 (β), vol. iv, p. 341, above.

⁵ For the Battle of Vouillé between the Frankish war-lord Clovis and the Visigothic war-lord Alaric II see II. D (v), vol. ii, p. 166; II. D (vii), vol. ii, p. 380; II. D (vii), Annex IV, vol. ii, p. 428; and the present chapter and volume, p. 217, footnote 1, above.

⁶ See p. 217, footnote 1, above.

Hijāz on battlefields that were something less than twenty miles distant from one another as the crow flies.¹ Charles Martel allowed the Arabs to come that much nearer to the home territory of the Frankish Power in the basins of the Seine and the Rhine² than Clovis had allowed the Visigoths to advance in the same direction before marching out to defeat them; but the event was the same. At Tours in A.D. 732, as at Vouillé in A.D. 507, the immovable Franks remained masters of the field.

These Frankish victories over Goths and Arabs were a double triumph for the tortoise who had been content to crawl from the Rhine to the Loire during the time that it had taken one hare to sprint from the Ukraine, and another to sprint from the Hijāz, to the tortoise's doorstep in Aquitaine. In this contest between the barbarians for the division of the Hellenic dominant minority's territorial spoils the race was certainly not to the swift, though the battle may have been to the strong.³ But this revelation of the relative strengths of the rival barbarian war-bands is not the main interest of the two battles in which they tried conclusions with one another. The outstanding historical event to which the battles of Vouillé and Tours bear witness is not the discomfiture of the Goths and the Arabs by the Franks, but the collapse of the resistance of the Roman Power which had been the common arch-adversary of all the three combatants. By the time when, in the heart of the *Orbis Romanus*, the war-bands from beyond one of the four anti-barbarian frontiers encountered and defeated—on derelict Roman ground—the war-bands from beyond each of the other three frontiers, it was manifest that the third of the three attempts of the external proletariat to take the Hellenic universal state by storm had been completely and definitively successful.

After this cursory review of the Hellenic external proletariat's successive relations with the Hellenic dominant minority, from the beginning of the schism down to the dominant minority's collapse, we may be inclined to raise two general questions which are suggested by analogy with our foregoing study of internal proletariats.⁴ In the External Proletariat's reaction to the Dominant Minority's pressure, can we see any symptoms of a gentle as well as a violent response? And can we credit the External Proletariat with any creative activities?

¹ The battle between the Austrasians and the Arabs which is traditionally known by the name of Tours seems actually to have been fought in the neighbourhood of Old Poitiers, in the angle between the rivers Clain and Vienne.

² Charles Martel's sluggishness in marching to the help of the Aquitanians in A.D. 732 may be compared with the sluggishness of the Spartans in coming to the Athenians' aid in 490 B.C. and again in 479 B.C.

³ Ecclesiastes ix. 11.

⁴ In V. C (i) (c) 2, above.

At first sight it might seem that, in the Hellenic case, the answer to both questions was in the negative. We can observe our anti-Hellenic barbarian in diverse postures and positions. As Ariovistus, he is driven off the field by Caesar; as Arminius, he holds his own against Augustus; as Odovacer, he takes his revenge upon Romulus Augustulus. But in all warfare there are these three alternatives of defeat and equal honours and victory; and, in each alike of the three situations, violence monotonously rules and creativity is uniformly at a discount. We may be encouraged, however, to look beyond this first view of the External Proletariat's *éthos* and achievement when we recollect that the Internal Proletariat is apt to display an equal violence and an equal barrenness in its earlier reactions, while the gentleness which eventually expresses itself in such mighty works of creation as a 'higher religion' and a universal church usually requires both time and travail in order to gain the ascendancy. With this clue in our hands we can perhaps detect some faint and rudimentary parallels in the history of the Hellenic external proletariat to the Internal Proletariat's generic saving graces.

In the matter of gentleness, for example, we can at any rate perceive a certain difference of degree in the violence of the various barbarian war-bands.¹ We can see that, on the whole, the Goths compare favourably with the Huns and Vandals and Lombards and Franks, while the Franks, in their turn, compare favourably with the English, the Lombards with the Avars, and the Arabs with the Berbers, Franks, and Goths. If we were given the chance of transferring our lives to the post-Hellenic interregnum, instead of having to live them out in the present age of our own Western history, we should probably find that we had definite preferences, as between the tyranny of one barbarian war-band and another, when it came to choosing the exact time and place for our exchange of fortunes.

To begin with, we would assuredly rather live through the Visigothic sack of Rome in A.D. 410 than through the Vandal and Berber sack in A.D. 455; for, although the first violation of an imperial city which had seen no enemy within her gates for eight hundred years may have given the greater shock to a Roman who heard the news at a distance (as Jerome heard of the Gothic blow at Bethlehem),² we may conjecture that for the victim on the spot

¹ This point has been touched upon already in V. C (i) (b), pp. 26-7, above.

² While this [theological war] was being waged in Jerusalem, terrible news arrived from the West. We learnt how Rome had been besieged, how her citizens had purchased immunity by paying a ransom, and how then, after they had been thus despoiled, they had been beleaguered again, to forfeit their lives after having already forfeited their property. At the news my speech failed me, and sobs choked the words that I was dictating (*haeret vox, et singultus intercipiunt verba dictantis*). She had been captured—

the tempered barbarism of an Alaric must have been distinctly less hard to bear than the unmitigated barbarism of a Genseric. Indeed, the impression made upon contemporaries, when they heard the whole story, by Alaric's grant of asylum in the churches of Rome to the inhabitants of the captured city is commemorated in one of the most celebrated passages of Latin literature.

'All the devastation, massacre, depredation, arson and assault of every kind that has been perpetrated in the catastrophe by which Rome has just been overtaken has been done according to the custom of war; but in this catastrophe there has also been a new departure, an unprecedented spectacle. The dreaded atrocity of the barbarians has shown itself so mild in the event that churches providing ample room for asylum were designated by the conqueror, and orders were given that in these sanctuaries nobody should be smitten with the sword and nobody carried away captive. Indeed, many prisoners were brought to these churches by soft-hearted enemies to receive their liberty, while none were dragged out of them by merciless enemies in order to be enslaved.'¹

In another passage of his *magnum opus* the same Roman man-of-letters and Christian exponent of the philosophy of history upbraids his pagan Roman contemporaries for their ingratitude towards a God who had shown mercy to them beyond their deserts in allowing a divinely ordained capture of Rome by barbarian hands to be executed in A.D. 410 by the comparatively gentle hands of an Alaric rather than in A.D. 406 by the cruel hands of a Radagaisus.

'There is a merciful and miraculous act of God—an act performed within living memory and, indeed, quite recently—which our pagan contemporaries not only refuse to commemorate by returning thanks for it, but actually endeavour, so far as lies with them, to bury, if possible, in a universal oblivion. We should be showing ourselves as ungrateful as they are if we were to pass this mercy over in silence for our part. [The fact to which I refer is that] when Radagaisus, king of the Goths, at the head of a huge and savage war-band, had occupied a position close to the city, where his axe-edge was within striking distance of Roman necks, the barbarian invader was defeated in one day's fighting with such speed and at so slight a cost that, without one single

the City by whom the whole World had once been taken captive (*capitur Urbs quae totum cepit Orbem*). Worse than that, famine had anticipated the work of the sword, so that scarcely a remnant had survived to fall into captivity.'—Saint Jerome, Ep. cxxvii, cap. 12, written circa A.D. 412 (in Migne's *Patrologia Latina*, vol. xxii, col. 1094).

¹ Saint Augustine: *De Civitate Dei*, Book I, chap. 7: 'Quod in eversione Urbis quae asperae gesta sunt de consuetudine acciderint belli; quae vero clementer, de potentia provenerint nominis Christi.' In order to follow Augustine's own argument—which is to demonstrate, not the clemency of the Visigoths, but the power of Christ's name and the blessings of the Christian Era—the passage quoted in the text should be read in its context from the beginning of the Preface to the end of the chapter from which the present quotation has been taken.

Roman casualty—not to speak of the loss of a single Roman life—more than a hundred thousand of the enemy's host were laid low, while the leader himself was promptly captured and put to the death that he so richly deserved. If this fanatically heathen war-lord, with his vast and likewise fanatically heathen forces, had entered Rome, whom would he have spared? What martyrs' shrines would he have respected? In whose person would he have shown a fear of God? Whose blood would he have cared to save from being shed, whose chastity from being violated? . . . And yet our wretched pagans refuse to give thanks to the immense mercifulness of a God who, when He had determined to chastise with a barbarian irruption a generation that had earned a still heavier chastisement by its vices, still tempered His indignation with an immense compassion—of which He gave proof first in causing Radagaisus miraculously to be defeated . . . and then in allowing the capture of Rome to be executed by a different band of barbarians who, contrary to the whole custom of war as it has been waged in the past, gave quarter, out of veneration for the Christian Religion, to all who took sanctuary in our holy places.¹

Yet, without contesting Augustine's thesis that Rome had been let off comparatively lightly in being delivered into Alaric's hands rather than into Radagaisus's, the inhabitant of Rome who had saved himself alive in A.D. 410 by taking the asylum which Alaric had given must still have breathed a sigh of relief when Alaric died and his gentler brother-in-law Atawulf took command of the Visigothic host. And an equal relief must have been felt in A.D. 489–93 by the grandson of our survivor of the catastrophe of A.D. 410 when the barbarian war-lordship in Italy was wrested out of the hands of the Scirian Odovacer by the Ostrogoth Theodoric. Conversely, we know for a fact that on the battlefield of Vouillé, in A.D. 507,

¹ Saint Augustine: *De Civitate Dei*, Book V, chap. 23: 'De bello in quo Radagaisus, rex Gothorum, daemonum cultor, uno die cum ingentibus copiis suis victus est.' The title of the chapter shows that Augustine's own argument here is to demonstrate, not the difference of degree between the more savage barbarism of a Radagaisus and the less savage barbarism of an Alaric, but, once again, the blessings of the Christian Era and the power of the Christians' God. In the second of the passages omitted from the above quotation Saint Augustine suggests that God's paramount purpose in bringing upon Radagaisus his miraculous defeat was 'to save the minds of the weak from being confounded by the glory that would then have been given to the demons of whom Radagaisus was a notorious worshipper'. And the contingency here referred to is explained in the earlier of the two omitted passages. 'What fine things our pagans would have had to say for their gods, and with what exultant insolence they would have boasted that the secret of Radagaisus's victory (if he had won the day), and of his potency (if a victory had proved it), was that he was placating and soliciting the Gods by daily sacrifices when the Romans were inhibited by the Christian Religion from doing likewise. Why, when Radagaisus was on his march to the place where he was crushed by the effortless exertion of the will of God's Majesty (*nutu summae maiestatis*), and when he was "in the news" all over the World, we were hearing at Carthage that the pagans [at Rome] were believing and propagating and boasting that, in virtue of the protection and assistance that Radagaisus was receiving from gods who were his friends because he offered sacrifice to them every day (so it was said), the barbarian invader was quite invincible in face of Roman opponents who would not perform, and would not allow any one else to perform either, any corresponding acts of worship to the Gods of Rome.'

the grandson of an Arvernian nobleman who had striven to save his native canton from falling under the Visigothic yoke showed himself worthy of his grandfather by fighting and dying under the Visigothic banner to save Aquitaine from being snatched out of the grasp of her first barbarian conquerors by the yet more barbarous Franks.¹ In Aquitaine, as in Italy, at the turn of the fifth and sixth centuries of the Christian Era, a Roman *vir senatorius* can have felt no hesitation in preferring a Gothic to a Frankish or a Scirian master; and two hundred years later an Andalusian peasant perhaps found as little difficulty in determining his preference when the Arabs replaced the Visigoths as the barbarian war-lords of the Iberian Peninsula; for the Muslim conquerors treated their new Christian subjects in the west no differently from their older Christian subjects in the east, and we have explicit testimony to the lightness of the Umayyad yoke towards the close of the seventh century in the former Oriental provinces of the Roman Empire. In a chronicle which reflects the views of the conquered provincials it is recorded of the Umayyad Caliph Yazid I (*imperabat* A.D. 680-3) that

'he was a delightful character and enjoyed an extreme personal popularity among all the subject peoples of his dominions, because he never thirsted for any of the pomp which is universally regarded by princes as the prerogative of their high estate, but made himself accessible to everybody and lived like a simple commoner.'²

Between a Yazid, who receives this mead of praise from his subjects, and an Attila who is remembered by his victims as 'the Scourge of God', there is a diversity of barbarian temper which cannot be ignored; and the spiritual history of one of the barbarian war-lords of the post-Hellenic interregnum, who has already been honourably mentioned above, is illuminated by a deposition from Roman lips which shows him in the act of conversion from Violence to Gentleness.

'I myself also [writes Augustine's disciple Orosius, at the close of his chronicle of the tribulations of the Hellenic Society] once was present at a conversation, in the town of Bethlehem in Palestine, between the most blessed Jerome the priest and a gentleman from Narbonne who had had a distinguished military career under the Emperor Theodosius and was also a man of deep piety, mature judge-

¹ See II. D (v), vol. ii, p. 166, above.

² 'Iucundissimus et cunctis nationibus regni eius subditis vir gratissime habitus, qui nullam unquam, ut omnibus moris est, sibi regalis fastigii causa gloriam appetivit, sed communis cum omnibus civiliter vixit.'—*Continuatio Isidori Byzantia Arabica*, § 27, in Mommsen, Th.: *Chronica Minora*, vol. ii (Berlin 1894, Weidmann), p. 345. In the same paragraph Yazid's son and successor Mu'awiyah II is praised for being like his father; and in § 38 (Mommsen, p. 357) 'Umar II is described as being 'tanta . . . benignitatis et patientiae . . . ut hactenus tantus ei honor lausque referatur a cunctis, etiam ab externis, quantus ulli unquam viventi regni gubernacula praeroganti adlatus est'.

ment and sterling character in his private life. This gentleman told us that at Narbonne he had become extremely intimate with Atawulf, and that he had often been told by him—and this with all the earnestness of a witness giving evidence—the story of his own life which was often on the lips of this barbarian of abounding spirit, vitality and genius. According to Atawulf's own story, he had started life with an eager craving to wipe out all memory of the name of Rome, with the idea of turning the whole Roman domain into an empire that should be—and be known as—the Empire of the Goths. His dream was to see "Gothia" substituted for "Romania" (if I may be pardoned for introducing these convenient "slang" terms) and Atawulf seated on the throne of Caesar Augustus. In time, however, experience had convinced him that on the one hand the Goths were utterly disqualified by their uncontrolled barbarity for a life under the rule of Law, while on the other hand it would be a crime to banish the rule of Law from the life of the State, since the State ceases to be itself when Law ceases to reign in it. When Atawulf had divined this truth, he had made up his mind that he would at any rate make a bid for the glory, that was within his reach, of using the vitality of the Goths for the restoration of the Roman name to all—and perhaps more than all—its ancient greatness; for in that event the barbarian war-lord who had found it beyond his powers to wipe Rome out might still be remembered by Posterity as the architect of her restoration.¹

This passage is perhaps the *locus classicus* for evidence of a change from Violence towards Gentleness in the *êthos* of the external proletariat of a disintegrating Hellenic Society; and in the light of this ascertained fact we can identify certain accompanying symptoms of spiritual creativity—or, at any rate, originality—in partially reclaimed barbarian souls.

Atawulf, for example, was an adherent of the same religion as his brother-in-law Alaric; and Alaric's religion was not the paganism of his forebears—as Augustine points out in drawing his contrast between the Christian Goth Alaric and the pagan Goth Radagaisus.² At the same time, Alaric's Christianity was not the Catholic Christianity of Augustine himself and of Augustine's and Alaric's contemporaries in the derelict Empire on whose territory the barbarian war-lord and his followers were trespassing. On the European front the barbarian invaders of the Roman Empire during the post-Hellenic interregnum, in so far as they were not still pagans, were Arians; and, although their original conversion to Arianism instead of Catholicism had been a matter of chance, their subsequent fidelity to Arianism was deliberate.

¹ Orosius, P.: *Adversum Paganos*, Book VII, chap. 43. The vividness of this report of Atawulf's own account of his political conversion may call to mind another famous passage of Hellenic literature in which Plato puts into Socrates' mouth an account of the speaker's intellectual conversion from an interest in the Macrocosm to an interest in the Microcosm (Plato: *Phaedo*, 96-7, quoted in III. C (i) (c), vol. iii, pp. 186-7, above).

² See the passage quoted on pp. 224-5, above.

The North European barbarians who broke into the Roman Empire as Arians at the turn of the fourth and fifth centuries of the Christian Era were the children of fathers who had been converted by Arian missionaries while they were encamped in the no-man's-land beyond a then still standing Roman *limes*;¹ and the Arians of the Empire had been able to carry out this missionary enterprise in the wilderness because, at the time, they were enjoying, at home, the favour of the Imperial Government of the day. In the middle decades of the fourth century Arianism had been the personal religion of the Emperors Constantius II (*imperabat* A.D. 337–61) and Valens (*imperabat* A.D. 364–78) and therefore at the same time the state religion of those portions of the Empire over which the direct authority of these two emperors extended; and the temporary ascendancy to which Arianism attained within the Imperial frontiers, thanks to the active support of these two powerful patrons, was neither seriously impaired by the lukewarm Catholicism of their brothers who ruled in the western provinces nor effectively interrupted by the militant Neoplatonism which momentarily took the place of Arianism as the officially favoured religion during the brief reign of Julian (*imperabat* A.D. 361–3).² In these circumstances the barbarians beyond the Roman pale who became converts to Arianism in the fourth century no doubt accepted, together with the Arian creed, the Arian missionaries' claim to be preaching the form of Christianity which had come into the ascendant—and come to stay—on the Roman side of the line;³ and thus the converts, so far as they were aware, were taking a new departure which would bring them nearer, spiritually and culturally, to their Roman neighbours instead of widening the existing social gulf between those who found themselves on opposite sides of the geographical barrier of the *limes*.

This was, however, an illusion which could not, and did not, persist after the barbarians had broken through the Roman frontier defences in their third offensive, which began before the fourth century closed. In A.D. 378, on the battle-field of Adrianople,

¹ See I. C (i) (b), vol. i, p. 96, footnote 4, above.

² The Catholic restoration under Jovian, between the death of Julian in the summer of A.D. 363 and the accession of Valentinian and Valens in the winter of 363–4, was too brief to count.

³ This impression that Arianism was the prevalent form of Christianity in the Roman Empire would be strengthened by the fact that the barbarians to whom the Arian missionaries first addressed themselves were encamped opposite the Lower Danube sector of the Roman frontier, and were therefore within close range of Constantinople, which was the seat of government of both the Arian Emperor Constantius II and the Arian Emperor Valens. From the nomadicized Goths in the Great Western Bay of the Eurasian Steppe Arianism spread to the Goths' poor relations the Gepids in the borderland between the Eurasian Steppe and the North European forests, and thence to some of the forest-dwelling barbarians of Central Europe, such as the Vandals, Burgundians, and Lombards.

the Arian Goths with their own hands deprived the last of the Arian Emperors of his diadem and his life; and in the next generation, as they flooded in through the breach which had been only momentarily repaired by Valens's militantly Catholic successor Theodosius the Great, the Arian barbarians found themselves masters of the military and political situation in the defenceless territories of a decrepit empire whose Government was now as orthodoxly Catholic as was an overwhelming majority of the provincial population. Under these altered conditions the Arianism to which the triumphant barbarians continued to adhere could no longer be explained away as a half-unconscious tribute to the cultural prestige of the civilization whose body social they were physically assailing. Whatever it may have been before, this Arianism was now a badge¹—deliberately worn and sometimes insolently displayed—of the conquerors' social distinction from a conquered population with which they were now determined not to identify themselves (for the victorious barbarians were eager to exploit the political fruits of their military victory by stepping into the *ci-devant* Imperial Government's shoes and establishing themselves as a privileged ruling caste). This interpretation of the Arian barbarians' attitude towards their sectarian faith after they had carved their 'successor-states' out of the Roman body politic is supported by the fact that, the more truculent an Arian war-band was in its treatment of its provincial victims, the more fanatical it was apt to be in its hostility to Catholicism. While the subject Catholic populations in the Iberian Peninsula and Aquitaine and Italy were treated with tolerance by their Gothic masters, the more atrocious Vandal masters of a subject Catholic population in North-West Africa capped economic exploitation and political oppression with religious persecution.

While an Arianism which its barbarian converts had taken as they found it thus eventually became the distinctive badge of these particular bands of barbarian conquerors *in partibus subditorum*, there were other barbarians on other frontiers of the Empire who showed in their religious life a certain originality, or even creativeness, which was inspired by something more positive than a pride of caste. On the frontier in the British Isles, for example, the barbarians of 'the Celtic fringe', who were converted by Christian missionaries from the Roman Empire almost a hundred years later than the barbarians beyond the

¹ Barbarian or *ci-devant* barbarian conquerors sometimes advertise their distinctiveness by wearing badges that are visible and tangible. For example, Hammurabi continued to dress his hair in the traditional style of his Amorite Badu forefathers (cropped head, shaven upper lip, long beard) when he was the Emperor of the Sumeric universal state (see Meyer, E.: *Geschichte des Altertums*, vol. i, part (2), third edition (Stuttgart and Berlin 1913, Cotta), p. 632).

Lower Danube, and were therefore converted to a Catholic instead of to an Arian Christianity, were not content to adopt the alien religion *tel quel*, but moulded it, as we have seen, to fit their own barbarian heritage.¹ On the frontier facing the Arabian section of the Afrasian Steppe the transfrontier barbarians showed an independence which was greater still in their reaction to the same religious influences from the Roman side of the Syrian *limes*. In the creative soul of Muhammad² the radiation of Judaism and Christianity³ was transmuted⁴ into a spiritual force which discharged itself—whether this was the Prophet's original intention or not—as a new 'higher religion' with its own distinctive message and independent organization.⁵ Nor were the Arabs and the Celts the only members of the Hellenic external proletariat who showed a greater originality in the religious field than the Teutonic converts to Arianism. The ancestors of these Eastern Teutons had already tasted the experience of a religious revolution at least once before the Arian missionaries came to preach to them in the Transdanubian wilderness; for the paganism from which these missionaries redeemed their converts was not the primeval paganism which the remoter ancestors of the Transdanubian barbarians must originally have shared with the rest of Primitive Mankind.

The religion of Primitive Mankind is a worship of the community in any or all of the diverse aspects in which the community is revealed by the vital activities on which it depends for its perpetuation.⁶ In the life of a primitive community that is either quite untouched or only faintly titillated from a long way off by the social radiation of the civilizations, the two key-activities are the procreation of the human stock and the acquisition of the food-supply (an economic activity which presents itself, almost as a matter of course, in the form of procreation on the human

¹ See II. D (vii), vol. ii, pp. 322-8, above.

² And also in the soul of the Hijāzi Arab prophet's Najdī Arab contemporary and counterpart Maslamah (see III. C (ii) (a), vol. iii, p. 238, above). According to Nöldeke, Th., and Schwally, F., *Geschichte des Qurāns*, 2nd edition (Leipzig 1909-38, Dieterich, 3 parts in 6 instalments), part i, pp. 56-7, Maslamah was a prophet of a genuine originality, and the similarities between his teaching and Muhammad's are traceable to the two Arabian prophets' common debt to Christianity.

³ According to Nöldeke and Schwally, op. cit., part i, pp. 6-7, the Jewish influence that can be discerned in the Qur'ān is more considerable than the Christian influence—though one of the channels along which the Jewish influence percolated into Arabia may have been an Oriental Christianity.

⁴ 'Islam is the form in which Christianity made its way into Arabia at large (*in Gesamt-Arabien Eingang gefunden hat*).—Nöldeke and Schwally, op. cit., part i, p. 8.

⁵ See III. C (ii) (b), vol. iii, pp. 276-7, and Part III. A, Annex II, vol. iii, pp. 450-1, and V. C (i) (c) 2, in the present volume, pp. 127-8, above, and V. C (i) (d) 6 (δ), Annex, in the present volume, pp. 673-8, below.

⁶ For the primitive 'totalitarianism' in which the religious and political and economic aspects of social life are inseparable and indeed indistinguishable, see IV. C (iii) (c) 2 (β), vol. iv, p. 351, and V. C (i) (c) 2, in the present volume, pp. 160-1, above.

pattern when the food-supply is obtained by agriculture¹ and stock-breeding, and by no means necessarily in the form of strife and slaughter even when hunting is the principal economic resource).² A primitive community in this pristine state is apt to be worshipped mainly in the guise of a god or goddess of fertility, and only secondarily, if at all, in the guise of a destructive power. But, since the religion of Primitive Man is always a faithful reflection of his social conditions—whatever these conditions may be—a revolution in his religion is almost bound to take place when his social life is violently deranged by being brought into a contact with an alien human body social that is both close and hostile; and this is what happens when a primitive community which has hitherto been gradually and peacefully absorbing the beneficent influences of a growing civilization tragically loses sight of the gracious figure of Orpheus with his enchanting lyre,³ and finds itself brusquely confronted, instead, by the ugly and menacing countenance of the Dominant Minority in a civilization that has broken down and gone into disintegration. In this event the primitive community is transformed into a fragment of an External Proletariat; and this social revolution goes to extremes in that inmost layer of the External Proletariat which is in immediate contact with the body social of the disintegrating civilization across a regular military frontier.

In this situation there is a revolutionary inversion⁴ of the relative importance of the procreative and the destructive activities in the barbarian community's life. Procreation still counts for something—at least, in the human sphere—since without a supply of warriors it is impossible to make war at all; but, apart from the necessity of satisfying this demand for military 'man-power', it is now the destructive activity which is all-important. With the Dominant Minority's sword at its throat the External

¹ For the spiritual light which Mankind has gained by allowing its feelings and thoughts to play upon the parallelism between the life of plants and the life of men, see III. C (ii) (b), vol. iii, pp. 256-63, above.

² A hunting community is apt to look upon its game not as a hostile and hateful enemy but as a beneficent and amiable friend. The act of slaughtering the game does not seem to loom very large in the hunter's feelings and thoughts about his relation with the animals through whose death he lives; and at moments, and in situations, in which he cannot avoid recognizing the ugly truth that, for his own selfish ends, he is depriving the animal of a life which the animal does not wish to lose, the hunter usually shows embarrassment and ruefulness. He prefers to think of the animal—or the god incarnate in the animal—as a benefactor who is voluntarily sacrificing his life for Man's sake. In fact, the primitive hunter's attitude towards his game is not at all like his more sophisticated successor the warrior's attitude towards his human adversary. It is actually more like the Christian's attitude towards Christ.

³ See IV. C (iii) (a), vol. iv, p. 123, and the present chapter and volume, p. 210, above.

⁴ It will be seen that this particular vein of revolutionary change illustrates the thesis, put forward in IV. C (iii) (b) 1, vol. iv, pp. 135-6, above, that all revolutions are retarded acts of mimesis, in which the individual or community or society that is undergoing the revolution is responding to a 'challenge' from some other party.

Proletariat has to fight for its life; and its impulses towards strife and slaughter are thus diverted from the relatively innocent task of hunting animals to the sinister business of waging war against other human beings. War now becomes the community's all-absorbing occupation—in the first place because the urgency of self-defence drives all other social needs into the background, and secondly because the militarized barbarian gradually discovers—as the balance along the stationary *limes* inclines more and more in his favour¹—that a profession which has been thrust upon him as a necessity for his self-preservation can be turned to economic account as well on a frontier where the barbarian raider has gained the upper hand. When War thus becomes more lucrative, as well as more exciting, than the dull and laborious pursuit of agriculture, how can Demeter, or even Aphrodite, hope to hold her own any longer against Ares as the supreme expression of a deified community that is now no longer mainly intent upon either Aphrodite's or Demeter's work? In the last stage of this process of hammering out the External Proletariat on the anvil of War the once pacific and industrious primitive community resolves itself into a war-band; and when these Martians call upon their god, their cry is

'Blessed be the Lord my strength, which teacheth my hands to war and my fingers to fight.'²

The god whom a completely militarized External Proletariat has refashioned in its own image is a divine war-lord who employs his superhuman strength on the sub-human business of committing robbery and rape at the head of a divine war-band. We have come across divinities of this barbaric strain in the Olympian Pantheon which was worshipped by the Achæan external proletariat of the Minoan 'thalassocracy';³ and we have seen that these deified brigands in their eyrie on Olympus have their counterparts in the denizens of Asgard who were worshipped by the Scandinavian external proletariat of the Carolingian Empire, as well as in the gods of the Aryas who broke out of the Eurasian Steppe into the derelict domains of the Indus Culture and the Sumeric Civilization and the Egyptiac Civilization in the second millennium B.C.⁴ Another pantheon of the same kind was worshipped by the Teutonic barbarians beyond the European frontiers of the Roman Empire before the Eastern Teutons were

¹ For this 'law' of the *limes* see Part VIII, below.

² Psalm cxliv. 1.

³ See I. C (i) (b), vol. i, pp. 96-7, above.

⁴ For the family likeness between the Achæan, Scandinavian, and Aryan pantheons see II. D (vii), Annex V, vol. ii, pp. 434-7, above. For the *Völkerwanderung* of the Aryas and their Hyksos *apodasmos* see I. C (i) (b), vol. i, pp. 104-7, and II. D (vii), vol. ii, pp. 388-91, above.

converted to Arianism in the fourth century of the Christian Era and the Franks and the English to Catholic Christianity towards the close of the fifth and the close of the sixth century respectively. And, since Woden and his band were quite as far removed as the garrisons of Asgard and Olympus were from the worthier objects of the worship of an unspoiled Primitive Mankind, the evocation of these predatory divinities in their militarized worshippers' own image must be reckoned as a creative work that has to be placed to the credit of the Teutonic external proletariat of the Hellenic World.

Having gleaned these wisps of creative activity in the field of Religion, can we add to our slender harvest by drawing upon analogy once again? The 'higher religions' which are the glorious discoveries of the Internal Proletariat are notoriously associated with a sheaf of creative activities in the field of art. Every 'higher religion' that has come to flower has expressed itself in architecture and pageantry and music and singing and poetry, as well as in prayer and sacrifice. Have the 'lower religions' of the External Proletariat any corresponding works of art to show? Have they made any atonement in the aesthetic sphere for their moral ugliness?

These questions answer themselves in the affirmative; for, as soon as we try to visualize the Olympian Gods, we see them with our mind's eye as they are portrayed in the Homeric Epic; this poetry is associated with that religion as inseparably as Gregorian plain song and 'Romanesque' and 'Gothic' architecture are associated with medieval Western Catholic Christianity; and the brilliant poetic achievement of the barbarian makers of the Olympian Pantheon is by no means unique. In another context¹ we have observed that the Greek epic poetry of Ionia has its counterparts in the Teutonic epic poetry of England and in the Scandinavian Saga of Iceland. All three of these schools of literary art are expressions of a creative response to the stimulus of new ground on the part of barbarian war-bands who have made their *Völkerwanderung* by sea; and the three corresponding pantheons are manifestly another fruit of the same creative activity. The Scandinavian Saga is bound up with Asgard, and the English Epic—of which *Beowulf* is the principal surviving masterpiece—with Woden and his divine *comitatus*, as the Homeric Epic is bound up with Olympus. And when we inquire whether perchance the lesser stimulus of migration overland, which has been potent enough to evoke the Vedic Pantheon in the imaginations of the Aryas, has also moved them to any works of literary creation,

¹ In II. D (iii), vol. ii, pp. 94-6, above.

the answer is in the affirmative again; for the epic poetry which was precipitated by the *Völkerwanderung* of the Aryas, when they poured out of a Eurasian no-man's-land into the domain of the Indus Culture before the birth of the Indic Civilization, is to be found embedded—like a pearl in an oyster or like a fly in amber—in the *Mahābhārata* and the *Rāmāyana*.¹

Moreover, if we turn our attention from the North European to the Arabian *limes* of the Roman Empire, we shall see that epic poetry is not the only form of literary self-expression to which the transfrontier barbarians may be stimulated by the rising tension of their relations with the Dominant Minority on the opposite side of the military front. If the Arabic poetry which is traditionally ascribed to the pre-Islamic period is to be accepted as genuine, it affords us an example of a barbarian literature of 'the Heroic Age' which is lyrical in its vein and personal in its interest; and, even if the alleged examples of this pre-Islamic school of Arab literary art are to be rejected as spurious, we can still infer, from the unquestionably authentic rhymed prose of the Qur'ān, that there were poets before the Prophet Muhammad's day in the ranks of the Arabian wing of the external proletariat of the Hellenic World.

Our examination of the genesis, history, and achievements of this Hellenic sample of the External Proletariat is now complete; and we can sum up our findings as follows.

The secession of an external proletariat from the dominant minority of a disintegrating Hellenic Civilization produced a state of war between these two fractions of a formerly undivided and harmonious body social. The resulting hostilities began as a running fight and then turned into a stationary warfare along each of several different fronts. In this stationary warfare there were alternating bouts of activity and sluggishness; and these alternations were synchronous on all fronts. The bouts of activity took the form of successive attempts on the barbarians' part to break through into the dominant minority's domain. The first of these bouts coincided in date with the culmination of the disintegrating civilization's 'Time of Troubles'; the second coincided with a momentary collapse, in mid-career, of the disintegrating civilization's universal state; the third coincided with the social interregnum which followed the final break-up of the universal state and the simultaneous dissolution of the civilization itself. The first two barbarian attempts to break through were abortive, but the third was a success; and this successful break-through re-

¹ The relation of the Sanskrit Epic, in the form in which we have it, with the *Völkerwanderung* of the Aryas is discussed in V. C (i) (c) 3, Annex II, pp. 596-606, below.

sulted in a Völkerwanderung in which the triumphant barbarian war-bands swept over the derelict provinces of the decrepit universal state and carved out for themselves 'successor-states' in which they tried to settle down in order to exploit their victory and to live upon the conquered population as a privileged caste.

In all these vicissitudes of their struggle with the disintegrating civilization's dominant minority the barbarians walked undeviatingly in the path of Violence; but in the hour of their victory the several war-bands went to different lengths in the degree of the atrocity with which they treated their victims. Among some of them there was at least a tendency to incline from Violence towards Gentleness; and there was at any rate one victorious war-lord who was convinced by his personal experience that the fame for which he thirsted could only be won by his making it his mission to fulfil and not to destroy the work of the age-long adversary whose dominance had been broken at last. Nor was even the violence of the barbarians altogether uncreative. On one front they made for themselves, in the likeness of the war-lord and his band, a new pantheon which bore no closer a resemblance to the pristine objects of the worship of Primitive Mankind than it bore to the vision of God which was beheld by the prophets of the 'higher religions' that were arising; in the same age, in the bosom of the Hellenic internal proletariat. On other fronts they took some one of these 'higher religions' and either refashioned it into something new, or modified it to fit their own barbarian heritage, or at least adopted it in a sectarian form which became their own distinctive barbarian badge. These were rudimentary acts of creation, and this barbarian vein of creativity revealed itself not only in the field of religion but also in works of literary art. The North European barbarians who invented Woden and his band of deified freebooters were also the makers of *Beowulf* and the Continental Teutonic epic poetry. The Arabian barbarians who created Islam out of broken lights of Judaism and Christianity which flickered over their steppes were also the makers of a lyric poetry with a personal note which the Prophet Muhammad turned to religious account in the rhymed prose of the Qur'ān.

The Minoan External Proletariat.

If we have truly succeeded in making out the main features in the portrait of the external proletariat of the Hellenic Society, this scrutiny may provide us with a clue for carrying out the rest of our present survey. Let us now proceed to pass in review the

external proletariats of the other civilizations that have broken down and gone into disintegration, and mark whether any of the same features appear in their portraits too.

If we begin with the Minoan Civilization, to which the Hellenic Civilization is 'affiliated', we shall at once be able to locate the position of one Minoan *limes* which is commemorated down to this day by the still standing walls of Tiryns and Mycenae.¹ Those walls were built to keep at bay the barbarians of Continental Europe; and, while our archaeological evidence does not tell us whether any barbarian raiders from the 'no-man's-land' beyond this frontier had a hand in the first destruction of the palaces at Cnossos and Phaestus at the end of 'Middle Minoan II'—a catastrophe in which we seem to see the culmination of a Minoan 'Time of Troubles'²—Archaeology and Literature corroborate one another in their record of the *Völkerwanderung* in which these Continental European barbarians, after capturing the continental outposts of the Minoan Power and taking to the sea,³ eventually swept over the Minoan World—and hurled

¹ For the contrast between these Minoan frontier fortresses on the European mainland of Greece and the unvalled metropolises of the Minoan universal state on the island of Crete see II. D (v), vol. ii, pp. 159–60, above.

² See I. C (i) (b), vol. i, p. 92, footnote 3, and IV. C (ii) (b) 1, vol. iv, pp. 64–5, above, and V. C (ii) (b), vol. vi, p. 312, below.

³ For the Vandal-like audacity which was shown by the Continental European external proletariat of the Minoan Society in accepting the challenge of the Sea and bearding the Minoans on their own element see I. C (i) (b), vol. i, p. 93, and II. C (ii) (b) 2, vol. i, p. 333, above. The Achaeans can hardly have performed this feat without already having made themselves masters of the former Minoan fortresses on the mainland; but the archaeological evidence does not enable us to determine the date at which Mycenae and Tiryns changed hands; and it therefore remains uncertain whether the mainlanders who sacked Cnossos *circa* 1400 B.C. were the Achaean assailants or the Mycenaean wardens of the Continental European marches of the Minoan World. It is possible that the Mycenaean turned upon the Minoans *circa* 1400 B.C. (as, in Japan, the pioneer barons in the Kwanto turned upon the Imperial Court in Yamato in the twelfth century of the Christian Era), before the Achaean barbarians took advantage of this dissension among their adversaries in order to overwhelm Mycenaean and Minoans alike. For this possibility see II. D (v), vol. ii, p. 160, above. In the opinion of Glotz, G.: *La Civilisation Égée* (Paris 1923, *Renaissance du Livre*), p. 61 (cf. p. 245), our archaeological evidence proves that the Minoan Power in Crete was overwhelmed by the concerted action of the Mycenaean Power and 'the New Empire' of Egypt, which entered into direct relations with the Mycenaean in the reigns of the Egyptian Emperors Amenhotep II (*imperabat circa* 1450–1415 B.C.) and Amenhotep III (*imperabat circa* 1405–1370 B.C.). 'Ces cadeaux sont de véritables documents d'histoire diplomatique. Ils annoncent un événement considérable: le soulèvement du monde mycénien contre la Crète qui l'avait converti et transformé, un choc en retour qui allait détruire la puissance de Cnossos.' According to the same scholar the archaeological evidence proves further that the preceding radiation of Minoan culture from Crete into the Mycenaean domain on the mainland of European Greece had been ominously selective. When, towards the close of the seventeenth century B.C., the Minoan Civilization 'took' on the mainland (see the passage quoted from Glotz, op. cit., in I. C (i) (b), vol. i, p. 94, footnote 1, above), the continental ladies adopted all the Cretan fashions (for the style of these see the passage quoted from Glotz, op. cit., in I. C (iii) (c), vol. i, p. 174; footnote 1, above), but the continental men were refractory and, in particular, were unwilling to follow the Cretan men's fashion of shaving clean (Glotz, op. cit., pp. 78–9, 87, 91). If these external manners and customs (to which alone it is possible for archaeological evidence to bear direct witness) may be taken as outward visible signs of inward spiritual states, perhaps we are warranted in inferring, from the evidence in question, that the male half of the Mycenaean body social was never captivated, as the womenfolk

themselves against the ramparts of the Egyptiac World beyond it—¹ during the post-Minoan interregnum (*circa* 1425–1125 B.C.).

This story is written—for living eyes still to read—in the abiding marks of the fire that seared the faces of the gigantic earthenware jars in the Imperial store-houses at Cnossos on the day when the barbarians broke through the wooden walls of the 'thalassocracy'—which had been the Minoan universal state—round about the year 1400 B.C.;² and if, as we stand among the ruins of Cnossos, we fix our eyes on those sinister smirches that have been brought to light in our day, and then call to mind Saint Augustine's and Saint Jerome's descriptions³ of what their own feelings were when they heard the news of Alaric's sack of Rome in A.D. 410, we can perhaps enter into the feelings of unknown devotees of a falling Minoan Civilization who may have suffered as sharp an agony⁴ without having left any written memorial for a modern Western scholar to decipher. For our literary evidence of the final catastrophe of the Minoan Civilization we must turn to documents which are not the work of the Minoan dominant minority. The archives of the Egyptiac universal state have yielded up the official narrative in which the Government of 'the New Empire' has recorded its own success—through a victory bought at the price of social prostration⁵—in bringing the last and most violent onset of this post-Minoan Völkerwanderung to a tardy halt on the threshold of Egypt itself.⁶ And in the tale of the siege of 'Troy the barbarians' own epigoni have perhaps preserved the memory of a preliminary assault upon an outpost of the Hittite World on the eve of the great migration of 1200/1190 B.C.⁷ If the siege of Troy is an authentic historical event,

were, by the exotic Minoan culture, but always remained at least semi-barbarian at heart—in a state of repressed spiritual revolt which eventually broke out into an act of flagrant savagery at the turn of the fifteenth and fourteenth centuries.

¹ See I. C (i) (b), vol. i, p. 93, above, and the present chapter and volume, p. 269, and V. C (i) (c) 4, p. 352, and V. C (ii) (a), vol. vi, p. 207, below.

² See I. C (i) (b), vol. i, p. 93, and IV. C (ii) (b) 1, vol. iv, p. 64, above.

³ See the present chapter and volume, pp. 223–5, above.

⁴ See I. C (i) (b), vol. i, p. 93, footnote 1, above.

⁵ See IV. C (iii) (c) 2 (β), vol. iv, p. 422, above.

⁶ See I. C (i) (b), vol. i, pp. 93 and 100–2, above.

⁷ For the westward expansion of the Khatti Power in Anatolia, up to the threshold of a Minoan World which was then in its last throes, after the peace-settlement of 1278 B.C. between Khatti and 'the New Empire' of Egypt, see I. C (i) (b), vol. i, p. 114, above. Within the last few years the royal archives of the Khatti capital at Khattusas (the present Boghazköi) have yielded up documents which appear to give us glimpses of some of the movements in the post-Minoan Völkerwanderung between the sack of Cnossos *circa* 1400 B.C., which is recorded in the present condition of the ruins of the palace, and the grand finale of 1200/1190 B.C., which is recorded in the inscriptions of the Egyptiac Emperor Ramses III. These Hittite documents, like the Homeric Epic, show us the searowing descendants of the Continental European external proletariat of the Minoan World bearing down upon the seaboard of the Khatti Empire in Anatolia; but the maritime province which has to bear the brunt of the attack in this chapter of the story is Pamphylia and not the Troad. As early as the time of King Mursil II of Khatti (*regnabat circa* 1345–1320 B.C.) we find the name Akhkhiiyawa (? Achaia) applied to a

it must, of course, have been a minor affair by comparison with the successful raid on Cnossos and the abortive assault upon Egypt; and of these two great exploits there is no echo in the *Iliad* and the *Odyssey*. But, if the Homeric Epic is true to type in ignoring the greatest events of the age by which it has been inspired, and in exaggerating the importance of the affair which it has chosen to take for its theme,¹ it is incomparable in the art with which it has created 'a possession for ever' out of the fruitless deeds and ephemeral experience of one particular set of barbarian war-bands. In this Greek 'heroic' poetry the creative potentialities of an external proletariat have come to their finest flower. The magnificence of the Ionian Epos as a work of art is matched only by the inadequacy of the Olympian Pantheon as an object of worship.

The Syriac External Proletariat.

If we turn next to the Syriac Civilization, we shall find that several of the anti-barbarian fronts which formed themselves on its borders in the course of its disintegration have come to our attention already in considering the fortunes of the Hellenic dominant minority which took these fronts over as a result of Alexander's conquests in Asia and the Roman conquests in North-West Africa and the Iberian Peninsula.

These Syriac fronts set hard in the sixth century B.C., when both the main body of the Syriac Society in Syria and Iran and its offshoot in the western settlements of the Phœnicians overseas passed out of a Syriac 'Time of Troubles' into a universal state. The universal state of the main body was the Achaemenian Empire, which also embraced within its political frontiers the whole of the Babylonian World and that more mature half of the Egyptian World that lay to the north of the First Cataract.² The universal state of the Syriac transmarine world was the Carthaginian Empire. Both these Syriac empires were in contact with the Hellenic World—indeed, it was a Hellenic pressure that

maritime district of Southern Anatolia which seems to correspond to the country which in the Hellenic Age, after the post-Minoan interregnum, was known as Pamphylia, and which was inhabited, in this later age, by a Greek-speaking population. The king of Akhkhayawa who was Mursil's contemporary appears to have borne the name Tawagalawas (? *Ἐρεφονκλέης* or *Eteoclés*), while about a century later the same country was under the rule of an Attarissiyas (? Atreus). These fragments of the archives of Khatti point to the possibility that the Achæan ancestors of the later Greek-speaking Pamphyliaus may have already gained a firm enough footing in Pamphylia to impose the Achæan name upon the province within less than a hundred years of the sack of Cnossos circa 1400 B.C. (see Meyer, E.: *Geschichte des Altertums*, vol. ii, part (1) second edition (Stuttgart and Berlin 1928, Cotta), pp. 546–50; Schachermeyr, F.: *Hethiter und Achæer* (Leipzig 1935, Mitteilungen der Altorientalischen Gesellschaft, vol. ix, Heft 1/2, Harrassowitz), *passim*).

¹ The relation in which 'heroic' poetry stands to history is discussed in V. C (i) (c) 3, Annex III, pp. 607–14, below.

² For the political partition of the Egyptian World at the First Cataract from the fifth decade of the seventh century B.C. onwards see II. D (v), vol. ii, pp. 116–17, above.

had prevailed upon the Phoenician colonies in the west to unite their forces under Carthaginian leadership—but either empire also had its anti-barbarian frontiers. The Carthaginian Empire marched with the Afrasian Nomads in the Sahara and with the sedentary barbarians of North-West Africa and Spain. The Achaemenian Empire marched with the Afrasian Nomads in Arabia; with the Eurasian Nomads on the threshold of the Eurasian Steppe between the Pamir Plateau and the Caspian Sea; and with the sedentary barbarians of Europe in Thrace.¹

The history of the warfare between the Syriac dominant minority and the transfrontier barbarians on these five different fronts is rather intricate on several different accounts. In the first place there was no inner connexion—and therefore no significant correspondence in dates—between the respective courses of events on the Achaemenian and on the Carthaginian sectors.² In the second place the history of the Syriac Civilization was interrupted, in this field of action as in others, by the violent intrusion of the Hellenic Society through the force of Macedonian and Roman arms.

For the first two hundred years after the overthrow of the Achaemenian Empire by Alexander all the anti-barbarian fronts of the Syriac World in Asia were occupied and held against the barbarians by Hellenic Powers; and when, in the sixth decade of the second century B.C., Carthage was supplanted by Rome in Africa as well as in Spain, there was a moment when every single front of all the five—in Europe, Africa and Asia alike—was in Hellenic hands. This situation did not last; for, before the third quarter of the second century B.C. had run out, the Eurasian Nomads on the front between the Pamirs and the Caspian had broken the Bactrian Greek Power,³ and the defence of this front had devolved upon the Parthians.⁴ These Parthians, however, were

¹ These sedentary barbarians in Thrace screened both the Achaemenian dominions in Asia Minor and the Hellenic World in Peninsular Greece from a direct contact with the Eurasian Nomads on the Great Western Bay of the Eurasian Steppe; but the screen was thin. The Odryae themselves, who in this age were the dominant Thracian community in the Basin of the Maritsa, were perhaps of Nomad origin, if their name testifies to a kinship with the Agathyrsi of the Hungarian Alföld (see Part III. A, Annex II, vol. iii, p. 425, footnote 2, above), and there is no doubt about the Nomadism of the Getae, who ranged the Lower Basin of the Danube between the Balkens and the Transylvanian Carpathians. When, at some date before the close of the sixth century B.C., Darius the Great carried the Achaemenian frontier out of Asia into Europe across the Black Sea Straits, he broke right through the screen of sedentary barbarians and made an unsuccessful attempt to subdue the Scythian Nomads in the hinterland of the Milesian Greek colonies on the north coast of the Black Sea.

² There was, of course, a certain inner connexion between the respective relations of the Achaemenian and the Carthaginian Empire with the Hellenic World. This connexion is examined in Part IX, below.

³ See Tarn, W. W.: *The Greeks in Bactria and India* (Cambridge 1938, University Press), chap. 7: 'The Nomad Conquest of Bactria'.

⁴ See II. D (v), vol. ii, p. 141, footnote 2, and p. 144, and Part III. A, Annex II, vol. iii, pp. 412 and 449, above, and the present chapter and volume, pp. 275 and 310, and V. C (i) (c) 3, Annex II, in the present volume, p. 601, footnote 4, and p. 602, footnote 5, below.

themselves the epigoni of Nomads who had drifted out of Transcaspiā into Khurāsān little more than a hundred years before;¹ and, in summing up the history of South-Western Asia between the irruption of the Sakas² and the Yuechi³ *circa* 130–129 B.C.⁴ and the Battle of Carrhae in 53 B.C., it would be as true to say that the Parthians had carried the banners of Eurasian Nomadism into the heart of the Syriac World from the Caspian Gates to the banks of the Euphrates⁵ as it would be to say that they had shielded the heart of the Syriac World by stemming the tide of Nomad invasion at the Khurasanian escarpment of the Iranian Plateau.⁶ To the peasantry and townsfolk of Western Iran and 'Irāq their Parthian 'saviours' were perhaps hardly distinguishable from the Saka destroyers whom the Parthian arms were keeping at bay; and, in so far as the Parthians acquired a tincture of sedentary culture in the course of their south-westward advance, it was Hellenism rather than the Syriac Civilization that attracted them. Indeed, from first to last, they were better Philhellenes⁷ than they were Zoroastrians. It was not until the Arsacidae had been overthrown and supplanted by the Sasanidae *circa* A.D. 226/232⁸—some five hundred and fifty years after the overthrow of the Achaemenidae by Alexander—that the Khurasanian frontier over against the Eurasian Nomads for the first time passed back into the keeping of a purely Syriac Power; and, even when the Sasanids' other mission of completing the ejection of Hellenism from the Syriac World had been executed—after four hundred years of unsuccessful Sasanian efforts—by the Sasanids' conquerors the Primitive Muslim Arabs, another hundred years had still to pass before the Umayyad Power brought to an end, in A.D. 737–41, a Nomad domination over the Oxus-Jaxartes Basin which by then had lasted for eight centuries and three-quarters.⁹

This Arab conquest of the Oxus-Jaxartes Basin restored, over

¹ See II. D (vii), vol. ii, p. 371, above.

² The Saka invaders of Parthia in 129 B.C. appear to have consisted mainly of Massagetae and Sacaraucae (Tarn, *op. cit.*, p. 294).

³ The Yuechi appear to have been a horde of Tochari led by an aristocracy of Asii (Tarn, *op. cit.*, pp. 284–7).

⁴ The *termini post quem* and *prae quem* are respectively 141 B.C. and 128 B.C. The conventionally accepted approximate date *circa* 135 B.C. has been corrected to *circa* 130 B.C. for the Nomad invasion of Bactria, and 129 B.C. for the Nomad invasion of Parthia, by Tarn in *op. cit.*, *cap. cit.*, p. 294. According to the same authority, pp. 278–9, Farghānā had already been conquered from the Greek princes of Bactria by Sakas of the Sai-Wang horde *circa* 159 B.C.

⁵ See p. 216, above.

⁶ For the consequent diversion of these flood-waters from the Syriac World to India see V. C (i) (c) 3, Annex II, pp. 601–4, below.

⁷ This Parthian Philhellenism did not, however, amount to much (see V. C (i) (c) 4, p. 355, footnote 2, below).

⁸ See p. 216, above.

⁹ For the history of the Oxus-Jaxartes Basin from the irruption of the Sakas and Yuechi *circa* 130 B.C. down to the Umayyad conquest in A.D. 737–41 see II. D (v), vol. ii pp. 140–1, and II. D (vii), vol. ii, pp. 370–84, above. Since the publication of the first three volumes of the present work a masterly study of the subject has appeared in W. W. Tarn's *The Greeks in Bactria and India* (Cambridge 1938, University Press).

against the Eurasian Nomads between the Pamirs and the Caspian, that frontier of the Syriac World which had been originally established in the sixth century B.C. by the Achaemenidae¹ and which had survived the overthrow of the Achaemenian Empire for two hundred years. During the brief span of the fifth decade of the eighth century of the Christian Era, the Umayyad Caliphate united, in a single reintegrated Syriac universal state, not only the whole of the former domain of the Achaemenian Empire (save for its north-western provinces in Anatolia and Thrace),² but also all, and more than all, the former domain of the Carthaginian Empire in North-West Africa and the Iberian Peninsula.³ This momentary political unity was lost when the 'Abbasids overthrew and supplanted the Umayyads in Asia in A.D. 750; for a fugitive Umayyad succeeded in saving Andalusia for his House; and even in Africa the authority of the 'Abbasids was never very effectively or securely established west of Egypt. But, if the political re-union of the Syriac World under Umayyad rule was thus ephemeral, the accompanying social unification survived the division of the Caliphate and endured as long as the Syriac Civilization itself. From the eighth century of the Christian Era down to the close of the post-Syriac interregnum (*durabat circa* A.D. 975-1275) there was a unison in the movement of life through all the members of the Syriac body social from Andalusia to Transoxania. In the interior of the Syriac World this unison in this age declared itself in an active and rapid circulation of ideas and emotions and persons and commodities from end to end of this vast domain.⁴ On the anti-barbarian frontiers in the same age the same unison declared itself in a similarity and simultaneity in the vicissitudes of the military struggle on all fronts. In this respect the history of the relations between the Syriac dominant minority and its external proletariat under the 'Abbasid Caliphate and the Andalusian Umayyad Caliphate resembles the history of the Hellenic dominant minority and its external proletariat under the Roman Empire.

On the other hand the external proletariat of the Syriac

¹ See II. D (v), vol. ii, pp. 138-9, above.

² In the eighth century of the Christian Era the Thracian and Anatolian territories that had once belonged to the Achaemenian Empire were welded into an East Roman Empire by the genius of Leo Syrus and his son the Emperor Constantine V (see the references in IV. C (iii) (c) 2 (β), vol. iv, p. 322, footnote 2, as well as IV. C (iii) (c) 2 (β), vol. iv, pp. 340-5, above).

³ See II. D (v), vol. ii, pp. 203, above.

⁴ The intellectual monument of this social solidarity of the Syriac World in the Age of the 'Abbasids is the Arabic literature of the eighth to the thirteenth century of the Christian Era, which is the product of a Republic of Letters in which Cordovans and Samarqandis worked hand in hand. A signal example of the activity of the circulation on the economic plane is the spread through the Syriac World of the art of manufacturing, and the habit of using, paper (see Carter, T. F.: *The Invention of Printing in China and its Spread Westward*, revised edition (New York 1931, Columbia University Press), pp. 97-100).

Civilization has distinguished itself from other representatives of its class by performing on two occasions on three different fronts—and each time with momentous historical results—the *tour de force* of enlisting in its own ranks, and carrying away with it in its own marauding adventures, the children of an alien civilization.

The barbarians who broke through the Thracian front of the Achaemenian Empire and overthrew its Government and overran its territories in the third quarter of the fourth century B.C. were not the wild highlanders of the Istranja Dagh or Rhodope, and they were not even the Odrysae of the Maritsa Basin with their possible Nomadic antecedents and their undoubted talent for holding together a barbarian principality. The barbarian destroyers of the Achaemenian Empire were the Macedonian backwoodsmen of the Hellenic World; and they made their impetuous entry onto the Syriac stage in a dual role—as apostles of Hellenism and not merely as plunderers and exploiters of the society that was the victim of their prowess in arms. Similarly, in a later age, the Armenian barbarian soldier of fortune who battered down the defences of the Melitenian march of the 'Abbasid Caliphate¹ was fighting in the service of an East Roman Empire which was the premier state of a politically precocious Orthodox Christian Civilization,² while the Basque and Cantabrian and Asturian barbarians who broke through the European front of the Andalusian Umayyad Caliphate during the post-Syriac interregnum (*circa* A.D. 975–1275) were reinforced by their Western Christian co-religionists and European neighbours the Franks—wayward children of an infant Western Christian Civilization who readily relapsed into barbarism when their primitive passions were re-awakened by the scent of blood and the prospect of plunder.

The true date of the beginning of the Crusades³ is not A.D. 1095, when Pope Urban II made his historic call to arms, with a Levantine objective, in the market-place at Clermont, but A.D. 1018, when the first war-band of warriors from the northern side of the Pyrenees came over the mountains to join the Christian barbarians of the Iberian Peninsula in their assault upon the tottering defences of the Andalusian Umayyad Caliphate;⁴ for,

¹ See the present chapter, pp. 253–4, below.

² For the political precocity of the Orthodox Christian Civilization and its untoward results see IV. C (i) (c) 2 (β), vol. iv, pp. 320–408, above.

³ See I. B (iv), vol. i, p. 38, and II. D (vii), vol. ii, pp. 362–3, above, and V. C (i) (c) 4, in the present volume, p. 354, below.

⁴ In a different context we have studied the collision between the Syriac and the Western Christian Society in the Iberian Peninsula from the Western Christian point of view, and have watched how the Arab thrust from the Straits of Gibraltar towards the line of the Loire in A.D. 711–32 was answered by a Western Christian counter-thrust which was carried across the Pyrenees by Charlemagne in A.D. 778 and eventually across the Atlantic by Christopher Columbus in A.D. 1492 (see I. B (iv), vol. i, p. 38; II. D (v), vol. ii, pp. 202–6; and IV. C (iii) (c) 2 (β), vol. iv, p. 341, above). But, when

when once the young commonwealth of Western Christendom had joined in this Transpyrenaeen hue and cry, the flame of barbarian aggression spread like wildfire along the whole length of the Mediterranean, from west to east,¹ and found fuel in Orthodox

we look at the same collision of social forces from the Syriac standpoint, the Arab conquest of the Iberian Peninsula in A.D. 711-13 takes on the appearance of a long-deferred but none the less legitimate recovery for the Syriac World of a colonial domain which had been captured for Hellenism by sheer force of Roman arms in the Hannibalic War after it had been fairly won for the Syriac Civilization from Barbarism by a long line of Phoenician empire-builders—beginning with the maritime explorers who gained the first Phoenician foothold on the Iberian coast of the Atlantic at some date in or before the eighth century B.C., and culminating in the person of Hannibal's own father Hamilcar Barca, who carried the Carthaginian Peace into the interior of the Peninsula. It was the dominion exercised in the Peninsula by Hamilcar and Hannibal between the end of the First and the outbreak of the Second Punic War that was re-established, more than nine hundred years later, by Mūsā for the benefit of an Umayyad Caliph at Damascus (see II. D (v), vol. ii, p. 203, and II. D (vii), Annex IV, vol. ii, p. 432, above); and although, as we have observed (on p. 241, above), the political union of the whole Syriac World, from the Eurasian frontier of Transoxania to the Atlantic coasts of Morocco and the Iberian Peninsula, was thus achieved by the Umayyads only to be undone, within less than a decade, through a partition of the Arab Caliphate, in two extremely unequal portions, between the Umayyads and the 'Abbasids, the surviving Andalusian Umayyad Caliphate, in which a scion of Umayyah's House contrived still to reign over a remnant of his vast ancestral heritage, continued to play in the Peninsula the role of a reintegrated Syriac universal state which had been usurped by the rival and triumphant 'Abbasid Caliphate in the Asiatic and African provinces of the Syriac World. The two Caliphates not only lived on side by side to perform an identical social function in their respective domains: they also both dissolved simultaneously in the general post-Syriac interregnum of A.D. 975-1275; and in this world-wide débâcle the Basque and Asturian barbarians from beyond the European frontier of the Andalusian Umayyad Caliphate competed with the Murābit and Muwahhid Berbers from beyond its African frontier for the possession of the Umayyads' now derelict Peninsular domain (see II. D (v), vol. ii, p. 204, above).

It was in these circumstances that the children of Western Christendom on the farther side of the Pyrenees enlisted in the ranks of the European external proletariat of the Syriac World by joining in their Basque and Asturian co-religionists' barbarian invasion of Andalusia. The first of these Transpyrenaeen marauding expeditions from France was made in A.D. 1018 (ten years before the Andalusian Umayyad Caliphate finally broke up into a bevy of indigenous 'successor-states') by a Norman war-band under the leadership of Roger de Toeni. These Norman pioneers were followed in A.D. 1033 by a Burgundian war-band which was recruited by Odilo, the Abbot of Cluny, and which presented to the Abbey the booty won from the Muslims. Guy-Geoffrey, Duke of Aquitaine, followed in 1063; Thibaut de Semur, Count of Chalon, in 1065. Eble, Count of Rouci and Rheims, who was the son-in-law of Robert Guiscard and brother-in-law of Sancho King of Aragon and Navarre, took the same road in 1073 under the patronage of Pope Gregory VII. Duke Hugh of Burgundy came to fight for King Sancho in 1078; and from that time onwards, until the stream was diverted from Andalusia to Syria in 1095, there was a steady flow of Crusaders across the Pyrenees from Burgundy—not that the Burgundians were more adventurous than many others, but because the great Abbey of Cluny recruited them and launched them against the Unbeliever' (Petit, E.: *Histoire des Ducs de Bourgogne*, vol. i, p. 223, quoted in Bédier, J.: *Les Légendes Épiques*, 2nd edition, vol. iii (Paris 1921, Champion), p. 371).

'La France, comme on voit, n'a point attendu le concile de Clermont pour concevoir l'idée de la croisade et pour la réaliser. Normands, Champenois, Gascons, Provençaux, Bourguignons surtout, les aventuriers de toutes nos provinces y ont collaboré. Les Clunisiens — eux qui devaient plus tard inspirer la *Chronique de Turpin* et soutenir le mouvement du pèlerinage de Compostelle — ont commencé par organiser des expéditions armées en Espagne. Avant de guider sur les routes de paisibles cortèges de pèlerins, ils y ont convoyé des bandes d'hommes équipés en guerre.' (Bédier, op. cit., loc. cit.)

These Transpyrenaeen Crusaders who came over the mountains in the eleventh century of the Christian Era to reinforce the Christian barbarians of the Iberian Peninsula in their warfare against the Andalusian Umayyads and these Umayyads' indigenous successors may remind us of the Transalpine Gaesatae who came to the help of the Celtic barbarians of Italy in their struggle against the Romans in 225 B.C. (see II. D (vii), vol. ii, p. 345, footnote 2, above).

¹ See II. D (vii), vol. ii, p. 362, footnote 5, above.

Christendom as well as in Dār-al-Islām. The Pisans and Genoese chased the African Muslims out of Corsica¹ and Sardinia; the Normans chased them out of Sicily and pursued them as far as their own African coasts from a base of operations in Apulia and Calabria which the first generation of Norman adventurers in Southern Italy had captured from the East Roman Empire.² In the next stage of their aggressive advance the European barbarians—who needed no scratching to make them betray their primitive natures beneath their Western Christian veneer—could hardly be restrained from laying their covetous hands upon the metropolitan provinces of the East Roman Empire as they trekked across Rumania on their way to carve out the Frankish ‘successor-states’ of the ‘Abbasid Caliphate in Syria; and their great day came in A.D. 1204 when they sacked Constantinople itself and divided up the remnants of the East Roman Empire in Greece and the Archipelago. The longing to commit this crime, which was carried into effect in the Fourth Crusade, had by then been smouldering, unavowed, in the hearts of four generations of cross-marked adventurers ever since the Franks who went on the war-path in the First Crusade had noted the riches of the Imperial City of Orthodox Christendom when they were received within her gates as her citizens’ co-religionists and allies. The sack of Constantinople by the Crusaders is a barbarian exploit that deserves to be commemorated on the same roll of dishonour as the sack of Rome by the Vandals and the sack of Cnossos by the Achaeans.

Without attempting to trace the history of the relations between the Syriac dominant minority and its external proletariat through all these complications on each of its five fronts, we can perhaps gain some idea of its likeness to, or difference from, the corresponding passages of Hellenic history by first tracing the alternation of paroxysms and lulls on the principal Syriac anti-barbarian front—that is, the front over against the Eurasian Nomads between the Pamirs and the Caspian—and then surveying synoptically the simultaneous barbarian offensives which broke through the *limes* of a then divided Caliphate³ on all five fronts in the last act, during the post-Syriac interregnum of A.D. 975–1275.

On the Eurasian front we meet with the first great barbarian inroad in the age in which we should expect to find it on our Hellenic analogy. The Cimmerian and Scythian Nomad invasion of South-Western Asia in the eighth and seventh centuries B.C. coincided in date with the culmination of the Syriac ‘Time

¹ See further V. C (i) (d) 6 (γ), Annex I, p. 622, footnote 3, below.

² See II. D (v), vol. ii, p. 201; III. C (i) (a), Annex, vol. iii, pp. 458–9; and IV. C (iii) (c) 2 (β), vol. iv, p. 392, footnotes 1 and 2, and pp. 401–2, above, and the present chapter and volume, pp. 291–2, below.

³ See p. 242, footnote 4, above.

of 'Troubles';¹ and on this occasion the Nomad trespassers from the Desert on to the Sown penetrated almost as far as their predecessors the Aryas in the second millennium B.C.;² for the Scythians, too, made their way from Transoxania to Cisjordania—though, unlike the Hyksos, they were brought to a standstill at Gaza and never watered their horses in the Nile. The tide of barbarian invasion which thus momentarily submerged the whole of South-Western Asia towards the end of the seventh century B.C. was swept back in the sixth century to the north-eastern side of 'the Caspian Gates' by the Medes, and to the other side of the Jaxartes by the Achaemenidae;³ and the Achaemenian watch on the Steppe was so well kept that the Nomads did not move when the Achaemenian Empire stumbled and recovered itself in the middle of the fourth century B.C.⁴ Indeed, they did not even take advantage of the sudden and unexpected overthrow of the Achaemenidae, a few years after this recovery, by a Macedonian invader who broke into the domain of the Syriac universal state from the opposite quarter, out of the Thracian no-man's-land on the European side of the Black Sea Straits; and, even when they were given an opening at last by the break-up of the Achaemenian Empire's Seleucid Macedonian 'successor-state', they did not succeed in emulating the exploits of the Scythians or the Hyksos; for the Parthians, as we have seen, got no farther into the Syriac World than the line of the Euphrates, and the Sakas no farther than the Khurasanian escarpment of the Iranian Plateau; and eventually—when the Arsacids had been supplanted by the Sasanids, and the Sasanids in their turn by the Umayyads—these Umayyad sovereigns of a reintegrated Syriac universal state re-established the Central Asian frontier that had originally been won by Cyrus, and handed this restored frontier on to their own supplanters the 'Abbasids. It was only when the break-up of the 'Abbasid Caliphate brought with it the dissolution of the Syriac Society that the Eurasian Nomads broke into South-Western Asia once again and, on this occasion, repeated the Hyksos' feat when, in A.D. 1250, the 'successor-state' of the 'Abbasid

¹ It also coincided with an apparent period of aridity—and therefore of explosiveness—on the Steppes (see Part III. A, Annex II, vol. iii, p. 410, above).

² See the references on p. 232, in footnote 4, above.

³ See II. D (v), vol. ii, pp. 138-9, above.

⁴ The Central Government of the Achaemenian Empire had to fight for its life *circa* 366-359 B.C., when a number of satraps in the Asiatic provinces west of the Euphrates made a concerted revolt with the support of Egypt, which had been independent *de facto*, under an Egyptian nationalist Government, since 404 B.C. The crisis, however, was successfully met. In or about the year 360 B.C. the revolt of the satraps collapsed; and, when the Emperor Artaxerxes Ochus achieved the reconquest of Egypt in 343-2 B.C., it looked as though the Achaemenian Power had acquired a new lease of life (see further V. C (i) (c) 2, p. 94, above, and V. C (ii) (a), vol. vi, p. 207; V. C (ii) (b), vol. vi, p. 302; and V. C (ii) (a), Annex II, vol. vi, p. 442, below).

Caliphate in Syria and Egypt was usurped from the Kurdish Ayyubids by their Turkish mamlūks.

During this post-Syriac interregnum (*durabat circa* A.D. 975-1275)¹ the successive waves of the barbarian offensive on the Eurasian front all had their counterparts on each of the other four fronts.

In the latter part of the tenth century of the Christian Era, when the Eurasian Nomad Illek Khans were breaking upon the Transoxania, and the Saljūqs upon Transcaspiā, at the head of their respective Turkish war-bands, Arabian Nomads (Banu 'Uqayl and Banu Asad and Banu Kilāb) were breaking upon 'Irāq and the Jazīrah and Syria—partly at the instigation of the militant Shi'ī Carmathians, and partly under the leadership of a host of petty Arab war-lords (the Banu Asad under the Mazyadids and the Banu Kilāb under the Mirdāsids)² whose thirst for plunder did not disguise itself as religious enthusiasm.³ At the foot of the Taurus and the Amanus these tenth-century Arab barbarian invaders of the Syriac World from its Arabian hinterland collided with 'borderers' (ἀκρίται) of the East Roman Empire who were bearing down upon the Mesopotamian and Cilician and Syrian lowlands from the Anatolian plateau;⁴ and the two competing gangs of scavengers divided the local spoils of the 'Abbasid Caliphate mainly by ordeal of battle but partly also by pacific agreement.⁵ At the same moment the Katāma Berber high-

¹ This post-Syriac interregnum coincided exactly in date with an apparent bout of aridity on the Steppes, just as the second paroxysm (*circa* 825-525 B.C.: see V. C (ii) (b), vol. vi, p. 303, below) of the Syriac 'Time of Troubles' had been contemporaneous with an earlier apparent bout of aridity which may have lasted from about 825 to 525 B.C.

² See Part III. A, Annex II, vol. iii, p. 416, above. These minor Arab trespassers upon the fringes of a derelict 'Abbasid Caliphate at the turn of the tenth and eleventh centuries of the Christian Era may be compared with the Arab trespassers on the fringes of the Seleucid Empire in the same districts at the turn of the second and the last century B.C. (see pp. 215-6 and 218, above).

³ Shi'ism had, however, been professed by the Hamdānid leaders of the Banu Taghlib, who had made themselves masters of the Jazīrah and Northern Syria in an earlier generation (they had gained possession of Mawsil (Mosul) between A.D. 873 and A.D. 904, and of Aleppo in A.D. 944).

⁴ See IV. C (iii) (c) 2 (β), vol. iv, pp. 399-401, above, and the present chapter and volume, p. 242, above, and pp. 253-4, below.

⁵ The Nomad Arab war-band of the Banu Habīb, who had taken up their quarters in the Syrian provinces of the 'Abbasid Caliphate, went over, bag and baggage, to the East Roman camp in A.D. 928 (Grégoire, H.: 'L'Épopée Byzantine et ses Rapports avec l'Épopée Turque et l'Épopée Romane' in Académie Royale de Belgique: *Bulletin de la Classe des Lettres et des Sciences Morales et Politiques*, 5^e série, tome xvi (Brussels 1930, Lamertin), p. 466; idem: 'Autour de Digénis Akritas' in *Byzantion*, vol. vii (Brussels 1932, Secrétariat de la Revue), p. 288; for the capitulation, in the same year, of the Margrave of the Melitenian march of the 'Abbasid Empire see the present chapter, p. 254, below). The East Roman 'borderers' aggression was vigorously contested by the first of the Hamdānid Arab war-lords of Aleppo, Sayf-ad-Dawlah (*dominabatur* A.D. 944-67); but his successor Sa'd-ad-Dawlah (*dominabatur* A.D. 967-91) gave up the struggle and submitted to an East Roman protectorate in A.D. 969. (For the treaty establishing this relation see Vasiliev, A. A.: *Histoire de l'Empire Byzantin* (Paris 1932, Picard, 2 vols.) vol. i, p. 409; there is a Latin translation of the Arabic text in the Bonn edition of the East Roman historian Leo Diaconus (Bonn 1828, Weber), pp. 392-4.

landers from Eastern Kabylia, under their 'Fātimid' leaders, were bearing down upon Egypt after having already submerged the Aghlabi 'successor-state' of the 'Abbasid Caliphate in Ifriqiyah.¹ And at the same moment, likewise, the Iberian highlanders of Asturias and Navarre were making their first conquests at the expense of Dār-al-Islām in Andalusia. In the middle of the eleventh century of the Christian Era, when the Saljūq Turks were following the Parthian trail from Transcaspia to the Euphrates, the Banu Hilāl and the Banu Sulaym were breaking out of Arabia across Egypt into Ifriqiyah,² while the Lamtuna Sanhāja Nomad Berbers from the Sahara, under their Murābit leaders,³ were pouring across the Straits of Gibraltar to contend for the possession of Andalusia with the North Iberian Christian barbarians and their French co-religionists and allies from beyond the Pyrenees.⁴ In the third quarter of the eleventh century the Saljūq Turks collided with the East Roman 'borderers' in a race between these two barbarian competitors for the possession of the 'Abbasid Caliphate's Armenian Monophysite Christian 'successor-states';⁵ and before the close of the eleventh century the Saljūq Turks and the Katāma Berbers and the French Franks, in the course of their simultaneous invasions of the Syriac World from opposite quarters, had all come into collision, in a 'three-cornered duel', in Syria itself. In the middle of the twelfth century, when the Eurasian Nomad Ghuzz were treading on the Eurasian Nomad Saljūqs' heels in Transcaspia and Khurāsān, the Muwahhid Masmuda Berber highlanders from the Atlas were pursuing the Murābit Lamtuna Berber Nomads across the Straits.⁶ It was not until the twelfth century had passed over into the thirteenth that the Eurasian Nomads gave a decisive demonstration of their superiority in staying-power over all their barbarian competitors in the contest for the division of a moribund Syriac Society's heritage.

In the thirteenth century, when the East Roman 'borderers' were fighting their last rear-guard action on the Anatolian side of the Black Sea Straits, when the Arabian and North-West African reservoirs of aggressive barbarian 'man-power' had both temporarily run dry, and when the Frankish barbarian invaders of Syria were barely managing still to cling to their last footholds on the Syrian coast, the Eurasian Steppe delivered itself of the most violent and destructive eruption of Nomads that has ever been recorded in the annals of any of the sedentary civilizations.

⁴ See II. D (v), vol. ii, p. 204, above.

⁵ See IV. C. (iii) (c) 2 (β), vol. iv, pp. 400 and 401, above.

⁶ See II. D (v), vol. ii, p. 204, above.

In this century the Mongols—not content with invading the Far Eastern World in one direction and the Russian Orthodox Christendom in another—simultaneously flung themselves upon the Syriac World through the gap between the Pamirs and the Caspian, and devastated it with a ferocity which quite eclipsed the performances of the Ghuzz and the Saljūqs. The Mongol conquerors of Transoxania and Iran and 'Irāq pushed on across the Euphrates into Syria; and they would certainly have reached the Nile, and perhaps even the Atlantic, if they had not been repulsed on Syrian battlefields by their Turkish cousins the Egyptian Mamlūks, a pack of Eurasian Nomad wolves who had been trained by their Ayyubid masters to serve as Syriac watchdogs.¹

This rather perfunctory survey has perhaps brought to light a sufficient resemblance between the respective histories of the Syriac and Hellenic external proletariats to raise the question whether similar experiences have produced similar spiritual effects. We have seen that the Hellenic external proletariat was stimulated by its struggle with the Hellenic dominant minority into displaying a certain creativity in the two fields of religion and literature. In the same two fields do we find that the Syriac external proletariat has any creative works to its credit?

In the field of religion we shall search the record of the Syriac external proletariat in vain for any parallel either to the North European barbarians' creation of a pantheon in the image of the war-lord and his war-band or again to the Prophet Muhammad's achievement of conjuring a new 'higher religion' out of the religious influences that were radiating from the Hellenic World into the Arabia of his age. On the other hand we shall find several parallels in the history of the intercourse between the external proletariat and the dominant minority of the Syriac World to the Goths' adoption of an Arian instead of a Catholic Christianity and to their deliberate persistence in an originally undesigned sectarianism as a distinctive badge to mark them off from a Catholic subject population after their successful breach of the Roman *limes* had made their fortunes by suddenly promoting them to the status of a privileged ruling caste from their former status as outcasts wandering in the wilderness beyond the pale.

An inclination to resist conversion to the established religion

¹ For the successive Mongol invasions of Syria which were repulsed by the Egyptian Mamlūks see I. C (i) (b), Annex I, vol. i, p. 350, and IV. C (iii) (c) 2 (γ), vol. iv, p. 447, above. This successful stand against the Mongol Nomads which was made in Syria by the ex-Nomad Mamlūks may be compared with the successful stand against the Saka Nomads which was made in Khurāsān by the ex-Nomad Parthians (see II. D (v), vol. ii, p. 141, footnote 2, and the present chapter and volume, pp. 239-40, above, and V. C (i) (c) 3, Annex II, in the present volume, p. 601, footnote 4, and 602, footnote 5, below).

of the Syriac World of the day, without closing their ears to the preaching of the same faith in an unorthodox sectarian form, can be detected among the Syriac external proletariat both in the Sasanian Age, when the established religion was Zoroastrianism, and in the Age of the Arab Caliphate, when the established religion was Islam.

Between the Zoroastrian Church and the Eurasian Nomads there was a secular antipathy, which can be traced back to Zarathustra's own lifetime.¹ While the Iranian prophet addressed himself to the Nomads² as well as to the members of the sedentary society to which he himself belonged, he seems to have found the Nomads impervious to his teaching—as was indeed to be expected, considering that the substance of Zarathustra's message, on the social side, was a call to abandon the Nomadic for the sedentary way of life. Zarathustra's own personal hostility to Nomadism was conscious and avowed; and it seems to have evoked, among Nomads who persisted in the error of their ways, an answering hostility which was perhaps less articulate but which was not on that account less genuine. The Parthians, for example, were never more than lukewarm half-hearted Zoroastrians down to the day when they were overthrown by the zealous Sasanid Defenders of the Zoroastrian Faith—though by that time more than four and a half centuries had elapsed since the moment in the third century B.C. when an Arsacid war-lord had led his followers out of the desert of Transcaspia into the sownland of Khurāsān. Nor did the official patronage of the Arsacids' Sasanian successors avail to enable a Zoroastrianism which was now the established religion of Iran³ to propagate itself even among the *ci-devant* Nomad masters of the Oxus-Jaxartes Basin—not to speak of the unreclaimed Nomads on the open Steppe beyond.

In the Oxus-Jaxartes Basin—which had been thrown open to a constant radiation of Indic cultural influence ever since the crossing of the Hindu Kush by the first Bactrian Greek conqueror in the second century B.C.⁴—the Zoroastrian established church of the Sasanian Empire found the Mahāyāna already in possession of the field⁵ in the first half of the third century of the Christian Era; and four hundred years later, on the eve of the Sasanian

¹ See V. C (i) (c) 2, p. 121, footnote 1, above.

² See Pettazzone, R.: *La Religione di Zarathustra* (Bologna 1920, Zanichelli), p. 91.

³ The official establishment of the Zoroastrian Church by the Sasanian Dynasty, so far from being a boon to Zoroastrianism, cast a blight upon it (see V. C (i) (d) 6 (δ), Annex, pp. 659-61, below).

⁴ See II. D (v), vol. ii, p. 141, footnote 2, and II. D (vii), vol. ii, pp. 369-85, and V. C (i) (c) 2, in the present volume, pp. 132-3, above.

⁵ See V. C (i) (c) 2, p. 136, above.

Empire's fall, when the Chinese Buddhist pilgrim Hiuen Tsiang (Yuan Chwang) travelled across the Oxus-Jaxartes Basin *circa* A.D. 629, on his way to India, it is evident from his narrative that the Mahāyāna had not yet disappeared from Central Asia, even if its hold there had been weakened.¹ This survival of the Mahāyāna at the Sasanian Empire's gates is evidence of the ill success of the Zoroastrian Church's missionary propaganda; and corroborative evidence, which is more cogent still, is to be found in the fact that, while the ebb of the Mahāyāna in Central Asia in the Sasanian Age was undoubtedly due to a return of the tide of native Syriac cultural influences, the native Syriac religions which won ground in Central Asia in this age at the Mahāyāna's expense were Manichaeism,² which was proscribed and persecuted in the Sasanian Empire, and Nestorianism, which was grudgingly and precariously tolerated³ by the Sasanian Government for the negative reason that this sectarian form of Christianity was proscribed and persecuted in the contemporary Roman World. While the Zoroastrian missionary propaganda failed to make any headway beyond the north-east frontier of the Sasanian Empire, the Nestorian missionaries had succeeded, by A.D. 636, in carrying their faith right across the Eurasian Steppe to the capital of the T'ang Empire in the Far East;⁴ and in A.D. 762 the Manichaean missionaries succeeded in converting the Uighur Nomad masters of the Turfan Basin.⁵ The hold which Nestorianism obtained upon the Nomads, as well as upon the oasis-dwellers, in Eurasia was so strong that it even survived the overthrow of the Nestorian Nomad Karāyits and Naimans by the pagan Nomad Mongols at the beginning of the thirteenth century of the Christian Era. The Mongol victors took the conquered Nestorians into their service; and there were occasions, during the last and greatest eruption of the Eurasian Nomad Völkerwanderung into the Syriac Society's domain, on which it pleased the pagan Mongol conquerors of South-Western Asia to show their disdain for a Muslim subject population by ostentatiously bestowing their favours upon the religion of their Nestorian Christian secretaries and accountants.⁶

While the establishment of Zoroastrianism as the official religion of the Sasanian Empire had this unintended effect of commending a sectarian Manichaeism and Nestorianism to the Eurasian

¹ For Hiuen Tsiang's evidence see II. D (vii), vol. ii, p. 375, above.

² See V. C (ii) (c) 2, Annex I, pp. 575-80, below.

³ This toleration alternated with short but sharp outbursts of persecution.

⁴ See II. D (vi), vol. ii, pp. 263-8, above. The date is vouched for by the evidence of the Nestorian inscription of Si Ngan (see II. D (vii), vol. ii, p. 375, footnote 2, above).

⁵ See Part III. A, Annex II, vol. iii, p. 415, above.

⁶ See II. D (vi), vol. ii, pp. 237-8, above.

Nomad wing of the Syriac external proletariat, the next chapter of Syriac history—in which the Sunnah took the place of Zoroastrianism as the established religion of the Sasanian Empire's 'successor-state' the Arab Caliphate—shows us the Shi'ah, which was proscribed and persecuted throughout the Sunnī Caliph's dominions, making converts among the transfrontier barbarians in no less than three different directions: among the pagan Berbers in Africa; among the Zoroastrian Iranian highlanders in the Caspian Provinces;¹ and among the nominally Sunnī Arab Nomads in Hasā. And the sweeping success of this Shi'ī missionary enterprise in these three barbarian hinterlands of the Sunnī Caliphate procured for the Shi'īs the same revenge upon their orthodox Muslim opponents and persecutors that the discomfited Arians obtained for themselves against the victorious Catholic majority in the Roman Empire through the conversion to Arianism of the Goths and the Vandals.²

In the tenth century of the Christian Era, when the frontier-defences of the reintegrated Syriac universal state collapsed, the East Arabian barbarian harriers of 'Irāq and Syria and the Daylamī barbarian conquerors of Western Iran and Baghdad and the Katāma Berber conquerors of Ifriqiyah and Egypt all alike broke through as Shi'ī invaders of a Sunnī World; and the 'successor-states' of the 'Abbasid Caliphate which were founded by these victorious barbarians' Carmathian and Buwayhid and Fātimid leaders did not merely impose the military yoke of a victorious external proletariat upon the necks of a no longer dominant minority; they also established a Shi'ī minority's dominion over a Sunnī majority.³ This momentary Shi'ī ascendancy in Dār-al-Islām was brought to an end when the first wave of barbarian invaders from the threshold of the Syriac World was swamped by a second wave from an outer zone of barbarism which had never been reached by the Shi'ī missionaries; for these remoter barbarians had been converted, before they broke out of the wilderness, to the Sunnah—and this in an ultra-orthodox form.⁴ In Iran and 'Irāq the Shi'ī régime of the Daylamī Buwayhids

¹ For the parallelism, *vis-à-vis* the Arab Caliphate, between the position of these Zoroastrian barbarian highlanders in the Caspian provinces of Iran and the position of the Christian barbarian highlanders in the Biscayan provinces of the Iberian Peninsula see II. D (vii), Annex VIII, vol. ii, pp. 446–52, above.

² See pp. 227–9, above.

³ For this temporary ascendancy of the Shi'ah over the Sunnah in the 'successor-states' of the 'Abbasid Caliphate in the tenth and eleventh centuries of the Christian Era see I. C (i) (b), Annex I, vol. i, pp. 354–6, above.

⁴ See I. C (i) (b), Annex I, vol. i, p. 357, above. It may perhaps be conjectured that these belated Sunnī missions to an outer circle of pagan barbarians beyond the pale were stimulated, like the preceding Shi'ī missions, by the spur of adversity at home. At any rate, the Sunnī missionaries who converted the Sanhāja and the Saljūqs must have been operating from their respective bases of operations in Ifriqiyah and in Iran

was overthrown by the Sunnī Saljūqs, while the Fātimid Shī'i Caliphate which had been established by the strong arm of the Kabylian Katāma was overwhelmed in Ifriqiyah by the Katāma's western neighbours the fanatically Sunnī Kabylian Sanhāja,¹ and was extinguished in Egypt by a studiously orthodox Saladin.² Yet down to the end of the post-Syriac interregnum the Shī'ah continued to exercise its power of attraction upon the barbarian rulers of Sunnī subjects; for at the turn of the thirteenth and fourteenth centuries of the Christian Era, when the Mongol Il-Khans were experimenting in alternative substitutes for their ancestral paganism, they toyed with the Shī'ah,³ as well as with Nestorian Christianity, before they capitulated to the Sunnī orthodoxy which was the faith of the majority of the population of their dominions.

Thus the Syriac external proletariat resembles the Hellenic external proletariat in showing at least a certain originality—though perhaps not a positive creativity—in the field of religion. When we turn from religion to literature, do we find any poetic achievement of the Syriac external proletariat that can be regarded as an analogue of the Teutonic Epic? The answer is in the affirmative; for, while the African contingents of the Syriac external proletariat have not charged the air with any winged words to commemorate their historic experiences, their Asiatic and European comrades-in-arms have not remained dumb. The Macedonian *conquistadores* who broke through the Thracian front of the Achaemenian Empire in the fourth century B.C. have left a literary echo of their barbarian feat of arms in the Alexander Romance.⁴ The East Roman 'borderers' who broke through the Euphratean front of the 'Abbasid Caliphate in the tenth century of the Christian Era⁵ have left behind them an echo of their corresponding feat of arms in the epic of which the hero is Basil Digénis Akritas. And the French Crusaders who broke through the Pyrenaean front of the Andalusian Umayyad Caliphate in the eleventh century of the Christian Era have created a work

at a time when these regions were under the Shī'i rule of the Fātimids and the Buwayhids. We may remind ourselves that the Arian Lombards were at the gates of Rome at the moment when Pope Gregory the Great sent out his missionaries to convert the pagan English barbarians in Ultima Thule to Catholicism (see III. C (ii) (b), vol. iii, p. 269, above).

¹ Gautier, E. F.: *Les Siècles Obscurs du Maghreb* (Paris 1927, Payot), pp. 333-9.

² This overthrow of the Katāma and Daylamite barbarian converts to Shī'ism by the Sanhāja and Saljūq barbarian converts to the Sunnah may be compared with the overthrow of the Arian Visigoths by the Frankish converts to Catholicism.

³ See I. C (i) (b), Annex I, vol. i, p. 363, above.

⁴ For the divergence, which began within Alexander's own lifetime, between the literary tradition that grew into the Alexander Romance and the historical record of Alexander's authentic acts see Annex III to the present chapter, p. 608, and V. C (ii) (a), Annex II, vol. vi, pp. 441-4, below.

⁵ See V. C (iii) (c) 2 (b), vol. iv, pp. 399-400, above.

of art which is the parent of all the poetry that has ever been written in any of the vernacular languages of the Western World. The *Chanson de Roland*, at any rate, has outstripped *Beowulf* in its historical importance just as signally as it surpasses the *chef d'œuvre* of the Teutonic Epic in its intrinsic literary merit.

The geographical and social environment in which the Byzantine Greek Epic of Basil Digénis Akritas came to birth is proclaimed in the hero's standing epithet; for 'Akritas' means 'Borderer',¹ and the scene of action of every incident in the poem is located within the East Anatolian highland no-man's-land² where the East Roman Empire marched with the Arab Caliphate.³ The historical nucleus of the literary character that is the central figure of the poem seems to be an East Roman officer of the Anatolic army-corps⁴ named Diogenes, whose death in battle against the Arabs is recorded by the chronicler Theophanes (*sub Anno Mundi* 6281 = A.D. 788).

'Ces choses se passaient . . . dix ans apres que fut tombé dans la *clisura* de Roncevaux le Digénis Akritas des Francs, le paladin Roland, aussi obscur, aussi fameux que le héros d'Anatolie, mais mieux chanté que lui.'⁵

The original home of the epic which crystallized round this eighth-century East Roman officer's memory seems to have lain in the Taurus defiles and on the Cilician plain;⁶ but in the course of its growth the epic seems to have laid under contribution the personality and exploits of a later historical personage, the Armenian soldier of fortune Mleh (*Graecè* Melias),⁷ who conquered from a by then tottering 'Abbasid Caliphate the March of Lykandos on the East Roman Government's behalf in the

¹ See p. 246, above.

² For this no-man's-land, which gave birth not only to the East Roman Epic but also to both the 'Isaurian' and the 'Macedonian' dynasty of East Roman Emperors, see III. C (ii) (b), vol. iii, p. 274, footnote 2; IV. C (iii) (c) 2 (β), vol. iv, p. 365, footnote 4; and IV. C (iii) (c) 2 (β), Annex III, vol. iv, p. 630, above.

³ The lay of the Akritas Basil Digénis is not the only piece of Byzantine Greek epic poetry to which this Romano-Arab borderland has given birth. It has also generated the heroic ballad of Armourópoulos, which seems to have been precipitated by historical events which occurred in the ninth century (see Grégoire, H.: 'Autour de Digénis Akritas' in *Byzantion*, vol. vii (Brussels 1932, Secrétariat de la Revue), pp. 202-3, and the present chapter, p. 255, footnote 3, below), and likewise the cycle of Andronicus and Constantine Ducas, who are historical personages of the tenth century (see Grégoire, H.: 'L'Âge Héroïque de Byzance' in *Mélanges Offerts à M. Nicolas Jorga* (Paris 1933, Gamber), p. 391; eundem: 'Études sur l'Épopée Byzantine' in *Revue des Études Grecques*, vol. xlii (Paris 1933, Leroux), pp. 48-61).

⁴ For the origin and character of this East Roman army-corps and military district, see II. D (iii), vol. ii, p. 81, with footnote 1, and II. D (v), vol. ii, p. 153, with footnote 1, and IV. C (ii) (b) 1, vol. iv, p. 73, above.

⁵ Grégoire, H.: 'Le Tombeau et la Date de Digénis Akritas (Samosate, vers 940 après J.-C.)' in *Byzantion*, vol. vi (Brussels 1931, Secrétariat de la Revue), p. 499. ⁷ See p. 242, above.

reign of the Emperor Leo VI (*imperabat* A.D. 886-911) and afterwards cooperated with the East Roman general John Curcuas in the more ambitious conquest of the larger and more important Arab March of Malatīyah, on the right bank of the Upper Euphrates, in A.D. 928.¹ The scene of the Byzantine Greek epic hero's imaginary life was transferred from the Taurus to this conquered territory farther north-east, and the domain in the ancient district of Commagene which is assigned by the poet to the Cappadocian Akritas corresponds exactly with the domain which is known to have been assigned by the East Roman Government to their Armenian servant, Mleh 'in real life'.²

It will be seen that, from the Arab point of view, the East Roman 'borderers' whose features have been combined to compose the imaginary portrait of the hero of a Byzantine Greek epic poem were members of an external proletariat who had broken through the north-western *limes* of the 'Abbasid Caliphate when the Syrian universal state, which the Arabs had re-established,³ was *in extremis*; and the celebration of such barbarian feats of arms in epic poetry is something that we have now learnt to expect on the strength of the instances that have already come to our notice in the histories of other alien invaders of other collapsing universal states. The content of the Byzantine Greek Epic has, however, been enriched—and its history, by the same token, complicated—by reason of two facts which are both of them peculiar to this particular example of the phenomenon that we are now studying.

In the first place the East Roman Empire was something more than the barbarian no-man's-land which it looked like in the eyes of Arab wardens of the 'Abbasid marches whose acquaintance with the enemy's country was confined to the wilder regions adjoining the border. The East Roman Empire was, as we have seen in another context,⁴ a deliberate reconstruction of a Roman Empire which had been the Hellenic universal state, and in Byzantine Greek eyes it was the East Roman 'borderers' who were the wardens of the marches of Civilization and their Arab neighbours who were the transfrontier barbarians. The Arabs

¹ For the East Roman wars of aggression against the 'Abbasid Caliphate and its 'successor-states' which began with the campaigns of Curcuas see IV. C (iii) (c) 2 (β), vol. iv, pp. 399-400, above. The submission of Malatīyah in A.D. 928 seems to have been followed by a military occupation in 934.

² Grégoire, 'L'Épopée', p. 464; idem: 'Études sur l'Épopée Byzantine' in *Revue des Études Grecques*, vol. xlv (Paris 1933, Leroux), pp. 64-8; idem: 'Autour de Digenis Akritas', p. 288. Compare Goossens, R.: 'Autour de Digenis Akritas' in *Byzantion*, vol. vii (Brussels 1932, Secrétariat de la Revue), p. 316: 'Les chants épiques ont suivi, de la Cappadoce à l'Euphrate et à la Syrie, les frontières changeantes des deux empires dont ils retracent les luttes.'

³ See I. C (ii) (b), vol. i, pp. 76-7, above.

⁴ In IV. C (iii) (c) 2 (β), vol. iv, pp. 322-3 and 340-5, above.

had, indeed, actually played the part assigned to them in the Byzantine mental picture of Arabo-Byzantine relations. Before ever the East Roman 'borderers' found their opportunity to take the offensive at the 'Abbasid Caliphate's expense, the Arabs had conducted, twice in every year, regular seasonal raids into East Roman territory from a *placed'armes* on the Cilician Plain at Tarsus;¹ and the other Arab raiders who had been operating less systematically, and on a smaller scale, from a secondary base at Malatīyah had anticipated the East Roman 'borderers' in running true to the type of barbarians on the war-path. These Melitenian marchmen of the 'Abbasid Caliphate had celebrated their exploits on East Roman ground in a local epic of their own, which, like the contemporary Byzantine Greek Epic, was precipitated by the deeds of two historical personages. The first of these (corresponding to the East Roman officer Diogenes) was the Sayyid Battāl,² who died fighting against the East Romans in A.D. 739, at the Battle of Akroinon. The second (corresponding to the East Roman Government's Armenian henchman Mleh) was a margrave of Malatīyah named 'Umar, who played a part in the capture of the East Roman fortress of Amorium in A.D. 838³ and was finally overtaken, defeated, and killed in A.D. 863, in the course of a raid on Amisus, by the East Roman General Petronas.⁴ This Muslim Melitenian Epic seems also to have derived some of its inspiration from the ninth-century exploits of the Paulicians in the adjoining district of Tephrike,⁵ who, though not co-religionists of the Melitenian Arabs, had in common with them a perpetual feud with their other neighbours the East Romans. In the earliest of the foreign versions in which the Melitenian Arab Epic has come down to us at second hand the historical Paulician leaders Chrysocheir and Carbeas are made into the Amīr 'Umar's father and

¹ See II. D (vii), vol. ii, p. 368, with footnote 1, and IV. C (iii) (c) 2 (β), vol. iv, p. 400, footnote 2, above.

² See Grégoire, 'L'Épopée', pp. 468-70 and 480; eundem: 'Comment Sayyid Battāl, martyr musulman du viii^e siècle, est-il devenu, dans la légende, le contemporain d'Amer (†863)?' in *Byzantion*, vol. xi (Brussels 1936), pp. 570-5.

³ Amorium was not only the principal fortress in the Anatolic army-corps district; it was also the strategic key-point of all the Asiatic territories of the East Roman Empire, since it commanded the several routes leading from the south-eastern frontier to the Asiatic shores of the Bosphorus. The fall of Amorium in A.D. 838 made an impression on East Roman hearts and minds of which the depth and strength are attested by the existence of a Byzantine Greek heroic ballad of which the hero (Armourópoulos = the son of one of the East Roman defenders of Amorium whom the victorious Arabs had carried away captive) avenges and effaces the disaster by the feat of crossing the Euphrates and defeating the Arabs in their own territory (Grégoire, H.: 'L'Âge Héroïque de Byzance' in *Mélanges Offerts à M. Nicolas Jorga* (Paris 1933, Gamber), pp. 388-9; idem, 'Études', pp. 32-47; idem, 'Le Règne de Michel III' in *Byzantion*, vol. v (Paris 1930, Champion), p. 329).

⁴ For 'Umar's death see Grégoire, 'L'Épopée', p. 469; eundem: 'Le Règne de Michel III dans l'Épopée Byzantine' in *Byzantion*, vol. v (Paris 1930, Champion), p. 332.

⁵ For the death-struggle between the Paulician Republic of Tephrike and the East Roman Empire in the ninth century of the Christian Era see IV. C (iii) (c) 2 (β), vol. iv, pp. 364-6, above.

uncle respectively, and the capture of Amorium in A.D. 838 is attributed to them.¹

This Melitenian Arab Epic with a Paulician tincture in it must have already taken shape by the year A.D. 928, when the 'Abbasid March of Malatīyah was incorporated into the East Roman Empire. If the annexation of this Muslim territory had been carried out in the same grim spirit and brutal manner as that of the Paulician Republic of Tephrike some fifty-three years before, in or about A.D. 875, the East Romans might never have deigned to acquaint themselves with the work of the Melitenian minstrels' art and would certainly never have allowed it to have any influence on their own epic literature. What has complicated the history of the Byzantine Greek Epic is the fact that the incorporation of Arab Malatīyah into the East Roman Empire was achieved in the end by a voluntary capitulation which satisfied the *amour propre* of both parties and which was followed by a fraternization between these ancient enemies. The Melitenian Arab margrave Abu Hafs who tendered his submission to the East Roman general John Curcuas in A.D. 928² thenceforward fought, side by side with his conqueror, in the East Roman campaigns against Abu Hafs' own co-religionists in the interior of the 'Abbasid Empire.³ The East Romans responded by taking their new companions-in-arms to their bosom; and they gave a gracious literary expression to this union of hearts by incorporating into their own epic of the Akritas the Melitenian Epic in which the leading figure was Abu Hafs' grandfather the Amīr 'Umar.⁴ The association of the Melitenian

¹ Grégoire, 'Études', p. 64; idem, 'Le Règne de Michel III', p. 329. These attributions are made in the Byzantine Greek version of the Melitenian Arab Epic which now figures as Part One of the final form of the epic poem of Basil Digénis Akritas.

² Grégoire, 'L'Épopée', p. 466.

³ Grégoire, 'Le Tombeau et la Date de Digénis Akritas', p. 497.

⁴ The tenth-century Byzantine Greek version of the Melitenian Epic which constitutes Part One of the poem of Digénis in its final form is not the only trace of the Melitenian Epic that has come down to us. It can also be traced in one of the stories in the Arabian Nights (see Goossens, R.: 'Autour de Digénis Akritas: la "Geste d'Omar" dans les Mille et une Nuits' in *Byzantion*, vol. vii (Brussels 1932), pp. 305-12) and in an Arabic romance of the Romano-'Abbasid wars called *Dhāt al-Himmah wa 'l-Battāl* (see Goossens, op. cit., p. 317, and Canard, M.: 'Delhemma: Sayyid Battāl et 'Omar al-No'mān' in *Byzantion*, vol. xii (Brussels 1937), pp. 183-8). Moreover the Melitenian Epic seems to have enriched a non-Arabic literature twice over. After having, in the tenth century of the Christian Era, provided the materials for the present Part One of the Byzantine Greek epic poem of Digénis Akritas, it similarly provided, in the twelfth century, the materials for a Turkish Epic of which the hero is the Sayyid Battāl (though the Akritas figures in this Turkish poem, too, as a secondary character under the name of Akrates). The *terminus post quem* for the composition of this Turkish version of the Melitenian Epic is the conquest of the March of Malatīyah by the Muslim Turkish barbarian invader Gümüşhigin son of Dānışmand at the end of the eleventh century of the Christian Era in the wake of the Saljūqs (see I. C (i) (b), vol. i, p. 106, footnote 1; I. C (i) (b), Annex, vol. i, p. 349, footnote 1; IV. C (ii) (b) 1, vol. iv, p. 71; and IV. C (iii) (c) 2 (β), vol. iv, p. 398, above). The *terminus prae quem* cannot be very much later, since the last historical event mentioned in this Turkish Epic is the First Crusade (*gerebatur* A.D. 1096-9), while the last 'Abbasid Caliph mentioned is Mu'tasim (*imperabat* A.D. 833-42), who was the contemporary of the Amīr 'Umar of Malatīyah,

margrave 'Umar with the Cappadocian *akritas* Diogenes was neatly effected by a slight manipulation of the name of a Byzantine Greek literary hero whose historical nucleus had long since faded out of mind.

'L'Émir, que chantait sans doute plus d'une cantilène de Malatia, devint le père du héros grec, et Akritas lui-même, étant Digénis¹ ou fils de deux races, put être le héros commun des Grecs et des Syriens, des Cappadociens et des Euphratésiens. Le poème grec, avec ses deux parties, est la traduction poétique de l'annexion de Malatia.²

In the poem of Digénis as we have it, Part One is devoted to the glorification of Digénis' suppositious father 'the Amīr', and the poem breathes throughout a spirit of reconciliation between Greek and Arab. The Amīr is represented as abandoning Islam for Christianity out of love for the Greek princess who is to be Digénis' mother.³ The Amīr's raids into East Roman territory are celebrated as heroic feats of arms, while Digénis is never made to fight Arabs, but only East Roman outlaws.⁴ There is no touch, in the poem, of religious animosity.⁵

The weaving of the tenth-century Byzantine Greek epic poet's⁶ rope out of the diverse strands⁷ which offered themselves to his hand on either side of the Romano-'Abbasid military frontier⁸ has been deftly epitomized by the Belgian scholar who has taken the lead in unravelling this complex piece of literary history.

the hero of Part One of the poem of Digénis (see Grégoire, 'L'Épopée', pp. 471-3 and 480; Canard, 'Delhemma', pp. 186-7).

¹ *Sic*, for 'Diogenes'.—A.J.T.

² Grégoire, 'L'Épopée', p. 478.

³ Grégoire, 'L'Épopée', p. 465.

⁴ Grégoire, 'L'Épopée', p. 465.

⁵ Grégoire, 'L'Épopée', pp. 466-8.

⁶ The tenth-century rhapsode who composed the poem of Digénis as we have it was perhaps the pupil of Paphlagonian ballad-singers who are casually mentioned by Arethas of Caesarea (*vivebat* A.D. 850-932) (see Grégoire, 'Autour de Digénis Akritas', p. 291).

⁷ See Grégoire, 'Le Tombeau et la Date de Digénis Akritas', p. 491; eundem, 'Autour de Digénis Akritas', p. 289.

⁸ The only sources of the poem of Digénis that concern us for our present purpose are the Byzantine Greek heroic poetry from the East Roman side of the border and the Arab heroic poetry from the March of Malatīyah; but at least two other sources which have also been laid under contribution have been detected by the critics. One of these is the contemporary sophisticated Byzantine literature written in Attic Greek: e.g. the work of the historian Genesius (Bonn edition, pp. 121-6) appears to have been drawn upon by the rhapsode who made the present Part One of the poem of Digénis out of the Arab Epic of Malatīyah (Grégoire, 'Le Règne de Michel III', pp. 329-31; idem, 'Le Tombeau et la Date de Digénis Akritas', pp. 493-4). Another source was archaeological. Certain conspicuous ancient monuments of Hellenic origin in Commagene (the southern fringe of the Arab March of Malatīyah, between the Taurus and the Euphrates) were associated with Digénis Akritas in the rhapsode's imagination when the scene of the Byzantine epic hero's life and exploits was translated to this district after the incorporation of the March of Malatīyah into the East Roman Empire in A.D. 928 (Grégoire, 'Le Tombeau et la Date de Digénis Akritas', pp. 500-6). Similarly the name of one of Digénis' legendary adversaries, the Amazon Maximó, seems to have been taken from an ancient Greek inscription of *circa* A.D. 200 at Sebastopolis Pontica in honour of a certain 'Maxima alias Amazonis' (Grégoire, H., in *Byzantion*, vol. xi (Brussels 1936), pp. 607-10).

'De Digénis, héros du viii^e siècle (?), un versificateur du temps du Porphyrogénète [*imperabat* A.D. 911—59]¹ fit à la fois, en l'honneur du fondateur de la dynastie macédonienne, un Basile, et, en l'honneur des vaillants soldats du dernier thème-frontière, un éponyme de ce thème de Lykandos ou des Akrites. Réunissant sur sa tête la gloire impériale de Basile le Macédonien, les exploits récents et historiques de l'Arménien Mleh; évoquant par son second nom des prouesses fabuleuses comme la lutte contre le dieu de la mort; enfin, grâce à l'habile "calembour" d'un rhapsode, recueillant, lui, soldat chrétien, toute la célébrité d'une ascendance musulmane et paulicienne, où figuraient les plus redoutables ennemis de Byzance au ix^e siècle: Amer, Chrysochir, Carbeas, ainsi que toute la renommée d'une antique souche cappadocienne, les Kinnamos, et des deux familles historiques quasi-impériales, les Moselès et les Dukas — Basile Digénis Akritas, le plus composite des héros, nous apparaît comme la somme de la gloire militaire arabo-byzantine au milieu du x^e siècle."²

It will be seen that on the Euphratean front of the 'Abbasid Caliphate the creative effect, on the literary plane, of the border warfare between Arabs and East Romans was not one-sided but was reciprocal. Before the barbarian experience of breaking through the *limes* of a tottering Syriac universal state had inspired Byzantine Greek bards to compose the epic poem of which the hero is Basil Digénis Akritas, the Melitenian Arab marchmen of the 'Abbasid Empire in its heyday had tasted, for their part, the selfsame barbarian experience in their own raids into the East Roman Empire, and had been inspired by their exultation over these exploits to express themselves in a work of the selfsame epic genre of literature. The literary reciprocity between the two contending parties on this particular military border is commemorated in the mixed birth attributed to the hero of the Byzantine Greek Epic and in the duplication of the poem, which celebrates in Part One the exploits of the East Roman 'borderer's' Melitenian Arab adversaries before dealing in Part Two with the exploits of the Akritas himself.³ This peculiar feature of the

¹ The date of the composition of the poem as we now have it can be located within narrower chronological limits than those of Constantine Porphyrogenitus's forty-eight years-long reign. Part One must have been incorporated, from its Melitenian Arab source, after the capitulation of Abu Hafs to John Curcuas in A.D. 928 (see above). On the other hand the political geography of the Romano-'Abbasid frontier, as this is presented in the poem, shows that the poet must have finished his work before A.D. 969, when the situation described or taken for granted in the poem was radically changed as a result of the conquests made by the East Roman Emperor Nicephorus Phocas. More than that, we can infer that the poem was completed before A.D. 944, since it refers to the sacred relic of Edessa, which was transferred to Constantinople in that year, as being at Edessa, without any allusion to its translation (on this question of date see Grégoire, 'L'Épopée', pp. 463-4; eundem, 'Le Tombeau et la Date de Digénis Akritas', pp. 486-7).—A.J.T.

² Grégoire, 'Études', p. 69.

³ The way in which this literary reciprocity worked has been analysed as follows by Grégoire, H.: 'Échanges Épiques Arabo-Grecs' in *Byzantion*, vol. vii (Brussels 1932), p. 378:

'Il y a eu, d'un camp à l'autre, des échanges et des emprunts constants de motifs

Byzantine Greek epic poem of Digenis, which was precipitated by the East Roman 'borderers' barbarian feat of breaking through the *limes* of the 'Abbasid Caliphate in the tenth century of the Christian Era, is not to be found in the French *Chanson de Roland*, which appears to have been precipitated in the eleventh century by a corresponding barbarian feat of the French 'borderers' at the expense of the Andalusian Umayyad Caliphate and its indigenous 'successor-states' in the Iberian Peninsula. The problem presented by the *Chanson de Roland* is of a different order.

The original assonanced version of the *Chanson de Roland* is known to have been composed some time between A.D. 1080 and 1130;¹ and all the seventy or eighty *chansons de geste* of which the *Roland* heads the list are works of the twelfth and thirteenth centuries.² So much is common ground. But, because the heroes of this twelfth-century and thirteenth-century French heroic poetry are mental projections of mortal men who lived in the flesh in the generation of Charlemagne, while the date of the historical Battle of Roncevalles is known to have been A.D. 778, it has been assumed by one school of modern Western scholars that a twelfth-century poem which has Roncevalles for its theme and Roland for its protagonist must be the late flower of a work of art which had grown like a plant and had sprung from a seed that had been sown—as the seed of the corresponding Byzantine Greek Epic may have been sown³—more than three hundred years earlier. On this view we should have to believe that at least the elements of the *Chanson de Roland* took shape on the morrow of those eighth-century events that are celebrated in the poem as we have it. It has been left for a perhaps more judicious scholar of our own generation to maintain by weighty arguments that the earliest extant version of the *Chanson de Roland* is not the ultimate outcome of a long plant-like growth, but is the original creation of a single poet; and the gist of the demonstration consists in a circumstantial proof that the historical events that have kindled this twelfth-century poet's imagination are not those eighth-century campaigns of Charlemagne that have provided Tuoldus with his theme, but are eleventh-century expeditions of crusading French war-bands⁴ which were the liveliest living

"épiques". Mais toujours, et c'est naturel, le poète ou le conteur, soit byzantin, soit musulman, a introduit dans le thème plus ou moins banal une pointe à l'adresse des ennemis, ou des personnages d'origine étrangère. Ce sont ainsi de perpétuels renversements de rôles. Le problème se complique du fait même que les emprunts ne viennent pas toujours du même côté du *limes*. Une partie de la geste de Mélitène a été empruntée par les Grecs. Mais les Arabes ont riposté, en reprenant à leurs adversaires des histoires byzantines dont ils ont pour la plupart retourné la tendance.

⁴ See pp. 242-3, above.

social experiences of the poet's countrymen in the poet's own age.

'La *Chanson de Roland* n'étant rien qu'un épisode d'une guerre sainte en Espagne, à quelle époque naît l'idée de guerre sainte? Est-ce au temps de Charlemagne? Non; ce n'est ni de son temps, ni au ix^e siècle, ni au x^e;¹ mais bien au xi^e, dans la période qui précède immédiatement l'apparition de la *Chanson de Roland*.

'Cette période, des expéditions de chevaliers français en Espagne l'ont remplie. . . . Pour rendre compte de la *Chanson de Roland*, "il serait . . . naturel de rappeler ce qui s'était passé ou se passait au moment où le trouvère composait ses laisses, c'est-à-dire la guerre permanente que les seigneurs français faisaient aux Sarrasins d'Espagne depuis le début du xi^e siècle; tel est le fait d'histoire qui a déterminé l'auteur et inspiré son travail entier."²

'Ces chevaliers en effet qui au xi^e siècle s'acheminaient vers les antiques champs de bataille de Guillaume et de Roland, prenons garde qu'ils ont ressemblé au Guillaume des chansons de geste plus encore que le Guillaume de l'Histoire lui-même, au Roland des chansons de geste plus encore que le Roland de l'Histoire. Le Roland de l'Histoire meurt dans les Pyrénées en combattant les Basques, des Chrétiens; mais les chevaliers du xi^e siècle traversaient les Pyrénées pour s'offrir aux coups de vrais Sarrasins. Pour eux, bien plus que pour le Roland historique, la guerre sainte fut une réalité.

'Ce sont eux, croyons-nous, qui, les premiers, ont réveillé sur les routes le souvenir des expéditions de Charlemagne. . . . Comme Charlemagne ils s'arrêtaient à ces étapes nécessaires: Bordeaux, Sorde, Dax, Saint-Jean-Pied-de-Port. Ils campaient à Blaye, bivouaquaient à Roncevaux. A Blaye les clercs de Saint-Romain leur montraient la tombe de Roland; à Roncevaux ils vénéraient le lieu de son martyre.³

If we accept the theory of the origin and inspiration of the *Chanson de Roland* which is set forth in these terms by Monsieur Bédier, we are entitled to describe the French Epic as a creation of the European wing of the external proletariat of the Syriac

¹ Compare the absence of any trace of the crusading spirit in the tenth-century version of the Byzantine Greek epic poem of Basil Digénis Akritas (see p. 257, above). —A.J.T.

² Luchaire, A., in *Histoire de France depuis les Origines jusqu'à la Révolution*, publiée sous la direction d'Ernest Lavisse, vol. ii, part (2) (Paris 1911, Hachette), p. 392.

³ Bédier, op. cit., vol. iii, pp. 368-9 and 372-3. The tomb at Blaye, which was exhibited as the tomb of Roland to the eleventh-century French war-bands on the Pyrenean war-path, as well as to the pilgrims of later generations who followed the Crusaders' trail to the shrine of Saint James at Compostella, will recall to the mind of a classical scholar the grave-mounds that stand out on the sky-line above the shore of the Troad as the ship on which he is travelling from the Peiræus to Constantinople approaches the mouth of the Dardanelles; for in the Classical Age of Hellenic history these mounds were known to fame as the graves of Achilles and Patroclus. Since he first made this note, the writer has learned from Monsieur H. Grégoire ('Le Tombeau et la Date de Digénis Akritas', pp. 500-2) that the tomb attributed to Roland's Byzantine counterpart was in fact a grave-mound of precisely this type and location—standing out, as it did, on the sky-line within conspicuous view of one of the main overland thoroughfares in Com-magene.

World, corresponding to the Byzantine Greek Epic¹ of Basil Digénis Akritas which was created by the Asiatic wing of the same external proletariat under the stimulus of the same experience of breaking through the *limes* of a tottering Syriac universal state. In both the French and the Byzantine Greek Epic we can also see a true analogue of the Teutonic Epic which was created by the North European wing of the external proletariat of the Hellenic World, and with equal justification we may compare them both with the Homeric Epic which was created by the Continental European external proletariat of the Minoan 'thalassocracy'. The emergence of this set of correspondences is possibly an indication that we are on the right track, and is certainly an encouragement to persevere in our present line of exploration.

The Sumeric External Proletariat.

Now that we have finished our examination of the Syriac Civilization's external proletariat, the Babylonian Civilization thrusts itself next upon our attention; but, just because the histories of the Syriac and Babylonian worlds are so closely intertwined in their disintegration-phases, we shall not win much more grist for our mill by threshing a harvest from the Babylonian field. When we scan the last two centuries of the Babylonian 'Time of Troubles' (*durabat circa* 1000-600 B.C.),² we behold the selfsame barbarian war-bands that have already become familiar to us in our study of the almost contemporaneous Syriac 'Time of Troubles' (*durabat circa* 925-525 B.C.). We see the Cimmerians and Scythians bearing down upon South-Western Asia out of the Eurasian Steppe, and the Arabs simultaneously encroaching upon the desert borders of Babylonia and Syria.³ But we have observed and noted these particular barbarian offensives already; and we may therefore take leave to pass on at once to the history of the Sumeric Civilization which looms up in the Babylonian Society's historical background.

The Sumeric 'Time of Troubles' was opened, as we have seen,⁴ by the destructive career of Lugalzaggisi, the militarist master of Erech (Uruk) and Umma (*dominabatur circa* 2677-2653 B.C.), and it was brought to a close (*circa* 2298 B.C.) when

¹ Save for the apparent absence, in the French Epic, of any trace of that reciprocal literary influence between the contending parties on the two sides of the border which is an outstanding feature of the Byzantine Greek Epic (see pp. 254-9, above).

² The annihilation of the Assyrian state, army, and people in the war of 914-910 B.C. (see IV. C (iii) (c) 3 (a), vol. iv, pp. 468-70 and 482-4, above) may be taken as the culmination and close (see V. C (ii) (b), vol. vi, p. 308, below) of a 'Time of Troubles' which was followed by the establishment of a short-lived indigenous Babylonian universal state in the shape of the Neo-Babylonian Empire (see I. C (i) (b), vol. i, pp. 79 and 119, above).

³ See Part III. A, Annex II, vol. iii, p. 410, above.

⁴ In I. C (i) (b), vol. i, p. 109, and IV. C (ii) (b) 1, vol. iv, p. 64, above. See also V. C (ii) (b), vol. vi, p. 296, below.

Ur-Engur of Ur established 'the Empire of Sumer and Akkad' which became the Sumeric universal state.¹ This age of Sumeric history witnessed the formation of three anti-barbarian frontiers: one towards the Anatolian Plateau, another towards the Iranian Plateau, and a third towards the North Arabian Steppe.

On the Anatolian front the peaceful penetration of Cappadocia by Assyrian traders and prospectors, which had been going on while the Sumeric Society was in growth, was transformed, after the breakdown, into a military occupation in the twenty-seventh century B.C., when the Akkadian conqueror Sargon of Agade (*dominabatur circa* 2652-2597 B.C.) led his troops across the Taurus.² By the twenty-sixth century the relations between the dominant minority of the Sumeric Society and its external proletariat had similarly passed over from peace into war on the Iranian front too; for one of the finest of the monuments of Sumeric sculpture that have been recovered by our modern Western archaeologists is a stele of Naramsin (*dominabatur circa* 2572-2517 B.C.) which displays the militarist Sargon's like-spirited descendant in the act of attacking and slaughtering the highlanders of the Zagros in their mountain-fastnesses. Thereafter, in the twenty-fifth century B.C., when some two hundred and fifty years of unbridled militarism had exhausted the Sumeric body social to a degree at which it became impotent even in warfare, the great-grandchildren of Naramsin's barbarian victims in the Zagros avenged the wrongs of their ancestors by launching a counter-offensive which resulted in a barbarian triumph. For more than a hundred years (*circa* 2429-2306 B.C.) the homeland of the Sumeric Society in 'Irāq had to bear the yoke of the victorious barbarian Gutaeans;³ and this first experience of the bitterness of servitude to a barbarian master lasted until the eve of the foundation of the Sumeric universal state at the turn of the twenty-fourth century B.C. and the twenty-third.

In the meantime, while these Gutaeans 'invaders from beyond the Zagros frontier were battenning like vultures upon the heart of the Sumeric World, the Amorite Nomads from Arabia must have been engaged already on their slower but surer penetration of the western borderlands; for the Sumeric Emperor Hammurabi (*imperabat circa* 1947-1905 B.C.), who emulated Ur-Engur's achievement by reviving the Sumeric universal state which Ur-Engur had founded, was an Amorite in sentiment and tradition as well as in descent; the principality of Babylon, which was Ham-

¹ See I. C (i) (b), vol. i, p. 107, above, and V. C (ii) (b), vol. vi, p. 296, below.

² See I. C (i) (b), vol. i, p. 110, above, and V. C (ii) (a), vol. vi, p. 184, below.

³ See I. C (i) (b), vol. i, p. 109, and the present chapter and volume, p. 203, above, and V. C (ii) (a), vol. vi, pp. 184 and 234, and V. C (ii) (b), vol. vi, pp. 296-7, below.

murabi's ancestral patrimony, was not only, as its name records, a mythical 'Gate of the Gods', but was also the historical gateway through which the Amorite barbarian interlopers found their way into the Land of Akkad out of the North Arabian Steppe; and, since we know that the First Dynasty of Babylon, in which Hammurabi is the greatest figure, had been founded—about a hundred years before his accession—*circa* 2049 B.C., we may perhaps infer that the Amorite barbarian invaders of the Sumeric World were already on the war-path¹ before the foundation, at the beginning of the twenty-third century B.C., of the Sumeric universal state which was to be revived and administered, in the fullness of time, by a Babylonian Amorite saviour of the Sumeric Society.

It will be seen that, on at least two fronts out of the three, the culmination of the Sumeric 'Time of Troubles' was marked by encroachments or attacks on the part of the external proletariat, and that one of these attacks was unusually successful. If we set ourselves to translate these Sumeric transactions into terms of more familiar events in Hellenic history, we shall find our parallel to the Amorite infiltration into Syria and Akkad in the Arab infiltration into the same regions during the death agonies of the Seleucid Empire,² while we shall be inclined to compare the Gutaean invasion of the valley of the Tigris and Euphrates with the invasion of the valley of the Po by the Teutones and Cimbri.³ But, in order to make this second comparison work out, we shall have to reverse the historical outcome of the decisive battle on the Raudian Plains outside the walls of Vercellae, and to imagine the barbarians of Northern Europe enjoying in the last century B.C., before the establishment of the *Pax Augusta*, a foretaste of the triumph which in fact they never achieved until the fifth century of the Christian Era, after the Hellenic universal state had both come and gone. Our comparison shows that the synchronization of a bout of exceptionally severe barbarian pressure with the climax of a 'Time of Troubles' is still more emphatically marked in Sumeric history than it is in Hellenic; and, when we reach the last act of the play and watch the curtain rise over the scene of the post-Sumeric interregnum, we find, here again, another bout of barbarian aggression at a stage in the action at which our Hellenic analogy would lead us to look for it.

In the post-Sumeric interregnum the first of the victorious barbarian onslaughts appears to have been delivered on the Zagros front by a horde of Nomads from a distant Eurasian

¹ For the indications of an Amorite Völkerwanderung about the middle of the third millennium B.C. see Part III. A, Annex II, vol. iii, p. 404, above.

³ See p. 218, above.

hinterland. The Aryas whose advance-guard burst into Egypt out of the Syrian extremity of the Sumeric World about the year 1680 B.C. must have broken out of the Eurasian Steppe between the Pamirs and the Caspian, and swept on south-westward across the plateau of Iran and the plains of 'Irāq, within the two hundred years that intervened between the moment when these invaders eventually arrived at the north-east frontier of the Egyptiac universal state and the earlier date at which the revived Sumeric universal state had broken up irretrievably after the death of Hammurabi *circa* 1905 B.C.¹ In contrast to the profound effect of their impact upon Egyptiac history, these Nomads left so little trace of their passage across 'Irāq that even the date of it is a matter of inference; but we may conjecture that it was the Aryan invaders' audacious trespass upon the home territories of the Sumeric Society that revealed, in a flash, the decrepitude of the Sumeric universal state under the rule of Hammurabi's Babylonian Amorite successors; and that it was this revelation that moved to action certain other barbarian invaders who made a deeper mark. At any rate we know that Sargon's aggression against the barbarians beyond the Taurus was paid back in the post-Sumeric interregnum—more tardily but not less effectually than Naramsin's aggression in the Zagros had been paid back by the Gutaeans during the Sumeric 'Time of Troubles'—when King Mursil I of Khatti, the principal barbarian 'successor-state' of the Empire of Sumer and Akkad in Anatolia, not only raided the Land of Shinar but actually captured and sacked the city of Babylon,² which was the latter-day capital of the Sumeric universal state. The Cappadocian raiders were content to evacuate Babylon, as Alaric evacuated Rome in A.D. 410, with their hands full of booty and their souls satisfied by the achievement of a revenge which by this time was perhaps as much as nine hundred years overdue; but, while this barbarian wave from beyond the Taurus ebbed as rapidly as the Nomad wave from beyond the Zagros had rolled on, the Land of Shinar did not have peace; for the withdrawal of the Hittites back to the Taurus was followed immediately by the descent of the Kassite highlanders down from the Zagros; and the Kassites, like their predecessors the Gutaeans, came to stay. They sat ponderously upon the neck of a prostrate Babylonia from 1749 to 1173 B.C.³

¹ For the circumstances and date of the Aryan invasion of South-Western Asia and the lower valley of the Nile and the upper valley of the Indus see I. C (i) (b), vol. i, pp. 104-7 and p. 111, footnote 1; and II. D (vii), vol. ii, pp. 388-91, above.

² See I. C (i) (b), vol. i, pp. 110-11, and IV. C (ii) (b) 1, vol. iv, p. 64, with footnote 1, above. As has been noted already in the latter of these two places, this event is dated as early as *circa* 1806 B.C. by Delaporte and as late as *circa* 1750 B.C. by Meyer.

³ See I. C (i) (b), vol. i, p. 111, and IV. C (ii) (b) 1, vol. iv, p. 64, above.

In this post-Sumeric interregnum, again, we catch glimpses of an originality, and even a creativity, in the barbarian camp along the lines with which we have become familiar in our Hellenic prototype.

We may conjecture, for example, that the Aryas were profiting from the stimulus of their experience in breasting, and eventually breaking through, the north-east frontier of the Sumeric universal state when they created a characteristically barbarian religion and poetry which have been embedded—not in the Land of Shinar, but on the adjacent soil of the Indus Culture—in the Vedic Pantheon¹ and the Sanskrit Epic² of an Indic Civilization that sprang from this soil after the dust of the Aryan *Völkerwanderung* had settled down. There is no corresponding trace of these Aryan works of religious and poetic creation on Egyptiac soil during the brief episode of the Hyksos' occupation of the Delta of the Nile; yet this extreme right wing of the Aryan horde displayed at least a negative originality in refusing to capitulate to the established religion of the Egyptiac World which these migrant Nomads had overrun. During the hundred years of their dominion over the derelict domain of 'the Middle Empire' which had been the Egyptiac universal state, the Hyksos were not converted either to the worship of Re and the other gods of the Egyptiac dominant minority or to the worship of Osiris which was the 'higher religion' of the Egyptiac internal proletariat. They gave their allegiance to Set, who was the villain of the piece in the Osiris myth. And we may conjecture that it was the odiousness of the part which this God of Evil played in the Egyptiac Mythology that commended him to the Hyksos invaders and induced them to substitute Set for—or to identify Set with—their own Indra or whatever other Aryan name may have been borne by the barbarian war-god whom they had brought with them into Egypt as the divine leader of their raid.³

As for the Hittites and the Kassites, their religious history has less in common with that of the Hyksos than with that of the

¹ For the Vedic Pantheon see II. D (vii), Annex V, in vol. ii, and the present chapter, p. 232, above.

² In V. C (i) (c) 3, Annex II, below, an attempt is made to reconstruct the fifteen-hundred-years-long process of literary development through which the Sanskrit Epic, as we have it, grew out of the heroic poetry of the Aryan invaders of the Indus Valley in the second millennium B.C.

³ For this worship of Set by the Hyksos and for its effect upon the course of Egyptiac religious history see I. C (ii), vol. i, p. 144; V. A, in the present volume, p. 3, footnote 4; and V. C (i) (c) 2, in the present volume, p. 152, above, and V. C (i) (c) 4, in the present volume, p. 351, below. The remnants of the Hyksos horde which survived in Syria after their expulsion from Egypt in the sixteenth century B.C. must have carried their Set-worship with them; for the name turns up, in a later age, in the Syriac Mythology. An Egyptiac priest would have found it hard to recognize his God of Evil in the human Seth of Genesis iv. 25-6, who is 'the good boy' in the family of Adam and Eve, and who is rewarded for his virtue by being made the progenitor of Noah.

Aryan invaders of the Indus Valley. Both the Hittite masters of Cappadocia and the Kassite masters of the Land of Shinar appear to have amalgamated a barbarian pantheon of their own creation with the pantheon of the Sumeric dominant minority; but the two resultant syncretistic religions evidently differed markedly in the respective proportions in which the several ingredients entered into the mixture. The sluggish Kassites, who had exposed themselves to the full blast of the Sumeric Civilization's influence by settling upon the metropolitan territory of the Sumeric World, were content to adopt the native worships of Marduk-Bel and Shamash under the names of their own imported gods Kharbe and Buriash;¹ and even these names would have passed into oblivion if they had not happened to enter into the compound titles of Kassite kings who sat on the Throne of Babylon. On the other hand the lively Hittites substituted their own barbarian pantheon for all but a remnant of those Sumeric worships that had managed to obtain a foothold in the outlying Cappadocian province of the Sumeric Society's domain.²

The Egyptiac External Proletariat.

In the Egyptiac World we find three anti-barbarian fronts: first the north-eastern front—facing towards South-Western Asia across the Desert of Sinai—through which the Hyksos broke in about the year 1680 B.C.; second a southern front, up the Nile, over against the barbarians of Tropical Africa; and, third, a north-western front which faced towards North-West Africa across the Libyan Desert.

On the Asiatic front the Egyptiac 'Time of Troubles', as well as the post-Egyptiac interregnum, was signaled by an accentuation of barbarian pressure; for the Hyksos who broke through this front at the beginning of the interregnum, in the earlier part of the seventeenth century B.C., had been anticipated by an earlier horde of Asiatic barbarian invaders who had delivered their attack in the middle of the third millennium B.C. and who are perhaps to be identified with the Amorite Afrasian Nomads who, at that very time, were drifting out of the North Arabian Steppe into the western fringes of the Sumeric World.³ Unlike the Hyksos, these earlier Asiatic invaders suffered a repulse; but the Egyptiac Society only saved itself from a barbarian conquest on this occasion at the cost of a supreme military effort⁴ which

¹ See I. C (i) (b), vol. i, p. 116, above, and V. C (j) (d) 6 (8), in the present volume, p. 529, below.

² See I. C (i) (b), vol. i, p. 112, above.

³ See Part III. A, Annex II, vol. iii, p. 404, and the present chapter in the present volume, pp. 203 and 262-3, above.

⁴ Meyer, E.: *Geschichte des Altertums*, third edition, vol. i, part (2) (Stuttgart and Berlin 1913, Cotta), pp. 232-3.

brought on, with a run, the disintegration of the Egyptiac Civilization. The Asiatic barbarians were repelled by King Pepi I (*regnabat circa 2400-2380 B.C.*), and the crash¹ came in the reign of the victor's successor King Pepi II (*regnabat circa 2376-2282 B.C.*).²

The Asiatic barbarian offensive in the time of Pepi I appears to have been a retort to a previous Egyptiac movement of aggressive expansion which had begun, with the beginning of the Egyptiac 'Time of Troubles', under the Fifth Dynasty;³ and the Sixth Dynasty, of which Pepi I was the third representative on the Pharaonic Throne, seems not only to have kept up this offensive on the Asiatic front until the eve of the Asiatic barbarian counter-stroke, but also to have taken the offensive on the Upper Nile front as well.⁴

In another context⁵ we have already made some study of the effect of this southern anti-barbarian frontier of the Egyptiac World upon the internal life of the Egyptiac Society; and we have observed that the foundation of the Egyptiac universal state *circa 2070/2060 B.C.*, as well as the foundation of the United Kingdom *circa 3200 B.C.*, was the work of empire-builders who arose in the Southern March and whose military prowess had presumably been acquired in frontier-warfare against the adjoining barbarians. After the Theban princes of the Eleventh and Twelfth Dynasties had accomplished their oecumenical task of giving internal unity and peace to an Egyptiac World that had been distracted by a 'Time of Troubles', they turned back as Emperors of an Egyptiac universal state, with all the resources of the Egyptiac World now at their command, to fulfil their own special mission of serving as wardens of the Southern March.

¹ Meyer, *op. cit.*, vol. i, part (2), pp. 234-5, and the present Study, IV. C (ii) (b) 2, vol. iv, p. 84, above.

² These dates are reckoned on the basis of Eduard Meyer's chronology for the period of Egyptiac history before the foundation of 'the New Empire' by the first Emperor of the Eighteenth Dynasty, Amosis, *circa 1580 B.C.* While there is a consensus among modern Western scholars in regard to the chronology of the periods of Egyptiac history *post 1580 B.C.*, there is still a wide divergence of opinion in regard to the earlier—and historically far more important and interesting—ages. Meyer's reconstruction, which is one of the shortest in span, appears to the writer of this Study to be the most convincing; and the approximate dates here assigned to the reigns of the two Papis are arrived at by a comparison of two passages in Meyer's *Geschichte des Altertums*: vol. i, part (2), third edition (Stuttgart and Berlin 1913, Cotta), p. 236, and 'Die ältere Chronologie Babylonien, Assyrien und Ägyptens' (Stuttgart and Berlin 1925, Cotta), p. 68. The dating cannot be more than approximate owing to the defectiveness of our information. The combined duration of the Sixth and Eighth Dynasties is known to have been 181 years, which Meyer equates with the years 2423-2243 B.C.; and we also know that Pepi I and Pepi II were respectively the third and the fifth king in this series; that Pepi I reigned for 20 years and Pepi II for 94(1); and that there was an intervening reign of four years' duration. Unfortunately the lengths of the reigns of the first two kings of the series, as well as the seventh to the tenth inclusive, are unknown to us.

³ Meyer, *op. cit.*, vol. i, part (2), p. 209.

⁴ See Meyer, *op. cit.*, vol. i, part (2), pp. 211, 230-1, and 261.

⁵ In II. D (v), vol. ii, pp. 112-18, above.

The military conquest of the Nile Valley from the head of the First Cataract to a point above the head of the Second was accomplished by a series of warlike emperors beginning with Amenemhat I (*imperabat circa* 2000-1971 B.C.) and ending with Senwosret III (*imperabat circa* 1887-1850 B.C.). And this forward movement on this front was merely retarded, without being reversed, by the decline of 'the Middle Empire' and by its disastrous end in the successful breach of the Asiatic front by the Hyksos. For, when the Hyksos were expelled and the Egyptiac universal state was restored by another dynasty of Theban princes, the emperors of this Eighteenth Dynasty followed the example of their predecessors of the Twelfth Dynasty in resuming the work of southward expansion as soon as they had fulfilled their prior task in the interior of the Egyptiac World. Under 'the New Empire' the southern military frontier against the Tropical African barbarians was carried forward, as early as the reign of Thothmes I (*imperabat circa* 1557-1505 B.C.), as far as the foot of the Fourth Cataract; and in this chapter of the history of the Southern March the military conquest was followed up by a cultural assimilation of the conquered barbarians which was carried out so thoroughly that the subsequent decay of 'the New Empire' did not bring with it any weakening of the hold of the Egyptiac culture upon the population of 'the New Empire's' Nubian dominions.

Upon the break-up of the 'New Empire' at the turn of the twelfth and eleventh centuries B.C. the frontier-fortress of Napata, which had been planted at the foot of the Fourth Cataract by Thothmes I, now became the capital of one of 'the New Empire's' local 'successor-states'; during the hundred years ending about the year 655 B.C. this Napatan principality came near to success in emulating the thrice-repeated Theban achievement of uniting the entire Egyptiac World into a single state; and, even after it had been forced to renounce this oecumenical ambition, the Napatan Power remained in being for another nine hundred years—during which it maintained its own political independence against the successive Achaemenian and Macedonian and Roman conquerors of the Lower Nile Valley below the First Cataract, and at the same time preserved and even extended the domain of the Egyptiac culture in the Upper Nile Valley. By 300 B.C. the social centre of gravity of this Ethiopian half of the Egyptiac World had moved so far to the south that Napata, which had been first the frontier-fortress of 'the New Empire' and then the capital of its Ethiopian 'successor-state', was forced to surrender this latter honour to Meroe, at the foot of the Sixth Cataract. It was not until the third century of the Christian Era that these successive encroachments

of the Sixth¹ and Twelfth and Eighteenth Dynasties and their successors the Napatan and Meroitic princes of Ethiopia upon the domain of Tropical African barbarism at last evoked an effective barbarian counterstroke. In this century, when the Roman Empire only just succeeded in beating off the barbarian attacks that were launched against it simultaneously on all its four anti-barbarian fronts,² the principality of Ethiopia was overwhelmed and extinguished by a host of Nubian barbarian conquerors.

As for the third of the Egyptiac anti-barbarian frontiers, which faced across the Libyan desert towards North-West Africa, we find no certain trace of barbarian pressure here before the thirteenth century B.C.; and it is possible that the Libyan invasions of the Egyptiac World in this century and the next were not the direct results of hostile intercourse between the Egyptiac Society and the North-West African barbarians, but were rather a product of the post-Minoan *Völkerwanderung*. At any rate, these Libyan barbarian assaults upon Egypt overland coincided in date with those overseas attacks on the part of the sea-peoples of the Aegean that were undoubtedly a backwash from the troubling of the waters at the foundering of the Minoan 'thalassocracy'.³ In some instances it is evident that the Libyan and Aegean offensives were not merely simultaneous, but were deliberately concerted. And it is likely to have been the Minoan rather than the Egyptiac Civilization whose radiation into North Africa stirred the local primitive peoples up and set them on the move; for North Africa was much more easily accessible to the Minoan pioneers across the waters of the Mediterranean than it was to any Egyptiac pioneers who may have had the hardihood to venture out among the Libyan sand-dunes.

In the supreme crisis of the barbarian offensive against the Egyptiac World on the Libyan and Aegean fronts at the turn of the thirteenth and twelfth centuries B.C. the Libyan as well as the Aegean invaders were repulsed;⁴ but, unlike their Aegean comrades-in-arms, the vanquished Libyan war-bands did not take 'No' for an answer. While the discomfited Philistines and Teucrians settled down once for all in the Shephelah,⁵ the Libyans who had been hurled back when they presented themselves as invaders soon returned to offer themselves as mercenaries, and within a few generations the children had captured by 'peaceful penetration' the promised land which the fathers had failed to

take by storm. From the eleventh century B.C. onwards the domain of the Egyptiac Society from the Delta as far southward as the First Cataract was partitioned between the intrusive Libyan warlords in their garrison-towns and the tenacious Egyptiac priesthood in its temple-states.¹

The Sinic External Proletariat.

In the Sinic World, as in the Babylonian and Syriac worlds, the crucial anti-barbarian front was the frontier against the Eurasian Nomads;² and in this case, as in those, a civilization which was expanding in the course of its disintegration wantonly placed itself in contact with these formidable neighbours through its own act in breaking through a screen of highlander barbarians which had formerly insulated the Desert from the Sown. Just as the Assyrian conquest of the Medes in the eighth century B.C. opened the door for an invasion of South-Western Asia by the Cimmerians and the Scyths,³ so the conquest of the barbarians in the Shensi and Shansi highlands by the Sinic principalities of Ts'in and Chao and Yen in the fourth century B.C. brought the Sinic World into contact with the Hiongnu;⁴ and, though in the Sinic arena 'the Contending States' did not bring down upon themselves the catastrophe of a Nomad avalanche, they dammed it back at the cost of a Herculean effort.

During the last hundred years of the Sinic 'Time of Troubles' the states on the Eurasian border managed to divert part of their energies from their own fratricidal struggle for existence to the still more urgent task of building dykes to stem the Nomad flood; and, after the delivery of 'the knock-out blow' in the Sinic internal struggle by King Chêng of Ts'in in 221 B.C.,⁵ the victor justified his assumption of the title of 'the first universal monarch'—*She Hwang-ti*—by consolidating these haphazard local defences into the Great Wall.⁶ Yet even the construction of this classic artificial *limes* did not solve the problem of the relations between the Sinic Society and its Eurasian Nomad neighbours; for the unification of the Sinic World into a universal state was answered by a counter-unification of all the Nomads in the hinterland of the Great Wall,

¹ See IV. C (iii) (c) 2 (β), vol. iv, p. 422, above, and V. C (i) (c) 4, in the present volume, pp. 352-3, below.

² The Sinic dominant minority were also confronted by an external proletariat in the south, towards the southern watershed of the Yangtse Basin; but in this quarter they succeeded in preventing the formation of an anti-barbarian frontier; for they kept the southern barbarians on the run until, in this direction, they had extended the borders of the Sinic World up to 'natural frontiers' which were furnished by the water's edge of the South China Sea and by the eastern escarpment of the Tibetan Plateau (see V. C (i) (c) 2, pp. 141-2 and 147, and the present chapter, p. 206, above).

³ See II. D (v), vol. ii, p. 136, and the present chapter and volume, pp. 244-5, above.

⁴ See II. D (v), vol. ii, pp. 118-19, and III. C (i) (b), vol. iii, p. 167, footnote 1, above.

⁵ See I. C (i) (b), vol. i, p. 89, above. ⁶ See II. D (v), vol. ii, p. 119, above.

from the Upper Sungari to the Upper Irtish, into a barbarian anti-state under the leadership of the Hiongnu; and, within less than a hundred years after Ts'in She Hwang-ti had done his work, his successor Han Wuti (*imperabat* 140-87 B.C.) found the policy of standing on the defensive behind a fortified line so unsatisfactory that he deliberately embarked on the hazardous enterprise of conquering and subjecting the Hiongnu as an alternative to holding them at bay. The progress and eventual success of Sinic arms in this hundred years' war (*circa* 133-36 B.C.) have been mentioned in the foregoing chapter in their bearing upon the entry of the Mahāyāna into the Sinic World.¹ In this place we need only add that even the radical solution which Han Wuti put in train, and which was carried to its completion by Han Yuanti's general Ch'ên T'ang, was not, after all, definitive, because these conquests beyond the Great Wall, extensive though they were, did not bring the northern border of the Sinic universal state up to any 'natural frontier' which could insulate the Sinic World from contact with the barbarians in this quarter. When the frontier stood at the relatively remote line of Lake Baikal and the Altai, there was still an apparently boundless barbarian hinterland on the farther side—just as there had been when the frontier had stood at the relatively close-drawn line of the Great Wall. And an ineffectually militant Sinic Society did not even succeed in permanently subjugating, not to speak of assimilating, the barbarian population of the newly annexed territories. When the Prior Han régime collapsed²—perhaps partly under the strain of this titanic war of conquest—the momentarily prostrated Nomads shook themselves free again in the second decade of the first century of the Christian Era; and it was not until the eighth decade of the same century that Pan Ch'ao (*militabat* A.D. 73-102) could begin to reconquer for the Posterior Han that dominion over the Steppes which had been established for the Prior Han by Ch'ên T'ang more than a hundred years earlier.

Moreover, this second annexation of Eurasia to the Sinic universal state was as ephemeral as the first; for Pan Ch'ao's work began to crumble and dissolve as soon as the hero himself disappeared from the scene of action.³ On the Eurasian front the power of the Posterior Han was on the wane throughout the second century of the Christian Era; and the balance of power went on shifting more and more in the barbarians' favour when the post-

¹ See V. C (i) (c) 2, pp. 144-5, above.

² For the temporary relapse of the Sinic World into anarchy at the turn of the last century B.C. and the first century of the Christian Era, between the fall of the Prior Han and the rise of the Posterior Han, see V. C (i) (c) 2, p. 142, footnote 4, above, and V. C (ii) (b), vol. vi, p. 295, below.

³ See V. C (i) (c) 2, pp. 144-5, above.

Sinic interregnum set in, as it did before the century closed. To outward appearance the irretrievable collapse of the Sinic Society was staved off for another hundred years, during which the Empire of the Posterior Han first lingered on through a final phase of impotence (A.D. 172-221), then temporarily broke up into a trio of indigenous 'successor-states'¹ ('the Three Kingdoms' *gerebantur* A.D. 221-280), and was afterwards momentarily restored under the rule of the Western or United Tsin (*imperabant* A.D. 280-317).² But these successive political façades masked a social *dégringolade* which went to its greatest extremes in the relations between the dissolving Sinic Society and the inflowing Eurasian barbarians.

Even in the age when Pan Ch'ao was repeating the exploits of Wuti, the reassertion of Sinic authority on the Steppe was successfully disputed by a new Nomad Power which now loomed up above the Sinic horizon in the no-man's-land beyond the frontier between Korea and the Khingan Range. In A.D. 93 the Northern Hiongnu were conquered by the Sien Pi;³ and in A.D. 132 the name which had dominated the Eurasian hinterland of the Sinic World for the past five hundred years faded out of history when the Northern Hiongnu went into limbo in order to escape from an intolerable servitude to their fellow Nomad Sien Pi masters, while the Southern Hiongnu found shelter from the blizzard on the Steppes by drifting into the domain of the Sinic universal state⁴ and settling down on the lee side of a Great Wall which was no longer effectually manned for obstructing the passage of Nomad trespassers.⁵ These formidable movements of barbarian warbands on the Eurasian threshold of the Sinic World produced their inevitable consequences. At the turn of the third and fourth centuries of the Christian Era, at a moment when the political

¹ Although 'the Three Kingdoms' were of indigenous and not of barbarian origin, there was a strain of barbarism in their *éthos* which found literary expression in a romantic chronicle of their fratricidal wars that may be compared with the Alexander Romance. In the haze of this romantic tradition a military adventurer of the age, Kuang Yü, who lived and died as a man of flesh and blood, was gradually increased in stature and enhanced in potency until, in A.D. 1590, he was officially deified as the war-god of the Far Eastern World (Cordier, H.: *Histoire Générale de la Chine* (Paris 1920-1, Geuthner, 3 vols.), vol. i, p. 299).

² See IV. C (ii) (b) 1, vol. iv, p. 65, footnote 3, above.

³ See Cordier, op. cit., vol. i, pp. 275 and 278-9.

⁴ See Cordier, op. cit., vol. i, p. 292.

⁵ This passage of the Great Wall of China by the Southern Hiongnu in the second century of the Christian Era may remind us of the passage of the Lower Danube frontier of the Roman Empire, some two hundred years later, by the Visigoths, when these former denizens of the Great Western Bay of the Eurasian Steppe were fleeing before the face of a Hunnish horde of Nomads in whom some scholars have thought to recognize the descendants of those Northern Hiongnu who had made their escape out of Mongolia in a westerly direction, through the Zungarian Gap, in A.D. 132. For the circumstances of and sequel to the lodgement of the Visigoths on Roman territory in the last quarter of the fourth century of the Christian Era see Part III. A, Annex II, vol. iii, p. 426; IV. C (iii) (c) 2 (y), vol. iv, p. 440, footnote 4; and the present chapter and volume, p. 217, footnote 1, and p. 220, above.

unity of the Sinic World was nominally intact once more under the Western Tsin régime, we are confronted by the apparently sudden emergence, in the Eurasian marches, of three new 'successor-states' with archaistic names;¹ but a closer inspection reveals that both the character of the names and the suddenness of their assumption were deliberate ruses in a desperate and transparent attempt to keep up Sinic appearances. These respectable titles had been assumed with intent to veil the vulgar reality of a barbarian dominion on Sinic soil, and there was actually nothing new about this distressing state of affairs except the open acknowledgement of an accomplished fact which was the cumulative result of some two hundred years of silent and gradual social change. The 'Pe Yen' ('Northern Yen') principality in the Liaotung Peninsula was the Sinic dominion of the Sien Pi; the 'Pe Han' ('Northern Han') Empire in Eastern Shansi was the Sinic dominion of the Southern Hionggnu; the 'Wei' principality in Western Shansi was the Sinic dominion of the To Pa.

The epigoni of these last-named To Pa barbarian conquerors of Sinic ground turned right-about-face and embarked upon a new war of conquest against their own 'poor relations' on the Steppe in A.D. 370;² and in A.D. 386 they celebrated this successful repetition of the Eurasian achievements of the authentic Han by assuming the imperial title in rivalry with their own 'Pe Han' barbarian contemporaries;³ but this enlistment of barbarian arms in a Sinic war of revenge upon the barbarian world was a brief interlude in the course of the post-Sinic barbarian *Völkerwanderung*;⁴ for the Eurasian conquests of the 'Wei' Empire were quickly undone⁵ when, at the turn of the fourth and fifth centuries, the vanished Nomad Empire of the Hionggnu was reconstituted by the Juan Juan;⁶ and yet another wave of barbarian attack upon the ruins of the Sinic World was still to follow. In the sixth decade of the sixth century of the Christian Era the Juan Juan were overthrown and replaced by their former subjects the Turks between Altai and Khingan;⁷ and in the same decade, between

¹ See IV. C (ii) (b) 1, vol. iv, p. 65, above.

² For the cultural *volte-face* of which this military *volte-face* was a corollary, see V. C (i) (d) 6 (a), pp. 477-8, below.

³ See Cordier, op. cit., vol. i, p. 318.

⁴ The post-Sinic interregnum lasted from about A.D. 175 to about A.D. 475, and thus partly overlapped in time with an apparent period of relative aridity (and therefore of Nomad effervescence) on the Steppes which may have prevailed from about A.D. 375 to about A.D. 675 (see Part III. A, Annex II, vol. iii, p. 414, above). The conquest of the Steppe by 'Wei' was carried out on the eve of the onset of this apparent bout of aridity and effervescence; and the date is perhaps sufficient in itself to explain why the conquest was ephemeral.

⁵ On the other hand the 'Wei' Empire succeeded in handing on its pacific cultural achievements to a chain of 'successor-states' which led on to the *imperium redivivum* of the Sui and the T'ang (see V. C (i) (c) 4, p. 356, footnote 6, below).

⁷ Cordier, op. cit., vol. i, p. 351.

Khingan and Korea, the Khitan came treading on the heels of the Sien Pi.¹

The Indic External Proletariat.

If we turn from the Sinic to the Indic World, we shall find that in Indic history too the successful barbarian invaders were Eurasian Nomads, but we shall also find that the Indic body social—unlike either the Sinic or the Sumeric or the Babylonian or the Syriac—was never in direct contact with the Nomads across a military front. The Nomads who broke into the Indic World had to traverse both the Oxus-Jaxartes Basin and the north-eastern corner of the Iranian Plateau on their way from the Eurasian Steppe to the Indus-Ganges Plain; and during the life-span of the Indic Civilization—which extended from the close of the post-Sumeric interregnum about the middle of the second millennium B.C. to the beginning of the post-Indic interregnum in the fifth century of the Christian Era—these intervening territories were held, or at any rate overshadowed and dominated, by the Babylonian and Syriac and Hellenic civilizations in succession, and finally by the Syriac Civilization once again, when, in the third century of the Christian Era, the Syriac culture decisively re-asserted itself over Hellenism in Iran and 'Irāq.²

Whether the Indic Society was already the victim of Eurasian Nomad assaults across this intervening alien ground during the Indic 'Time of Troubles' (*saeviebat circa 725-325 B.C.*)³ is a question that has to be left unanswered for lack of evidence.⁴ The first Eurasian Nomad invasion of the Indic World that is adequately attested (after the Aryan Völkerwanderung which was

¹ Cordier, op. cit., vol. i, p. 359.

² For the expulsion of Hellenism from the Transeuphratean tracts of the Syriac World by the Sasanidae see p. 216, above.

³ See I. C (i) (b), vol. i, pp. 86-7, above.

⁴ It is tempting to conjecture that some of the warlike communities that were encountered by Alexander the Great in the Indus Valley in 327-324 B.C. were the descendants of Eurasian Nomads who had been deposited there by a more recent Völkerwanderung than that of the Aryas. The most recent period of aridity and effervescence on the Steppes may have run from about 825 to about 525 B.C. (see Part III. A, Annex II, vol. iii, p. 410, above), and this period partly coincides in date with both the Babylonian 'Time of Troubles' (*saeviebat circa 1000-600 B.C.*) and the Syriac 'Time of Troubles' (*saeviebat circa 925-525 B.C.*). In that age South-Western Asia had been overrun by the Eurasian Nomad Cimmerians and Scyths. Did one wing of this invading horde turn south-eastward after breaking out of the Steppe between the Pamirs and the Caspian, as the Aryan conquerors of the Indus Valley had turned south-eastward in their day when their Hyksos comrades had swept on across 'Irāq and Syria into Egypt? Perhaps the Pactyes on the Indo-Iranian border (Herodotus III, 102; IV, 44; VII, 67 and 85) were part of the offspring of this *apodasmos*, whatever we are to make of problematical Pactyes in Cappadocia (Herodotus III, 93). Is this hypothetical Indo-Iranian settlement, *post* 825 B.C. and *prae* 525 B.C., of Eurasian Nomads bearing the Pactyan name, and presumably belonging to the Iranian-speaking wing of the Nomad natives of the Eurasian Steppe, commemorated in the names Pakhtūn (*plural* Pakhtāna, *Indic* Pathan) and Pakhto, by which the living Iranian-speaking population in the north-eastern corner of the Iranian Plateau and its vernacular language are known respectively at the present day?

the prelude to the rise of the Indic Civilization) is one which was consequent—in the causal as well as in the temporal sense—upon the intrusion of the Hellenic Society on the Indic Society's domain; and this intrusion did not take place until after the Indic 'Time of Troubles' had been followed by the rise and fall of the Maurya Empire which was the first attempt at an Indic universal state.

We have seen¹ how in the second century B.C. North-Western India was united politically with both North-Eastern Iran and the Oxus-Jaxartes Basin under the rule of the Greek princes of Bactria; and we have also seen² how, before the century ran out, this Bactrian Greek Empire was swept away by an avalanche of Eurasian Nomads—the Sakas in the van, with the Yuechi at their heels—who broke out of the Steppe, across the former Achæmenian frontier between the Pamirs and the Caspian, about the years 130–129 B.C. In this eruption the Nomads were prevented from sweeping straight on south-westwards by the stubborn resistance of the Arsacid power in Khurāsān; and while the Yuechi were content to vegetate, for the next hundred and fifty years,³ in the *ci-devant* Bactrian Greek provinces, north-west of the Hindu Kush, which they had overrun at their first onset, the Sakas—who were caught between a Yuechi devil at their rear and

¹ In I. C (i) (b), vol. i, p. 86; II. D (v), vol. ii, p. 143; and V. C (i) (c) 2, in the present volume, p. 133, with footnote 1, above.

² In II. D (v), vol. ii, p. 141, footnote 2, and p. 144, and in the present chapter and volume, pp. 239–40, above. See also p. 310, below.

³ By the time, in or shortly before 130 B.C., when the Yuechi ousted the Far Eastern Greeks from their possessions in the Upper Oxus-Jaxartes Basin, north-west of the Hindu Kush, these Nomad intruders had been constantly 'on the run', with more powerful Nomad enemies at their heels, since at the latest 174 B.C., and, after these forty years of wandering in the wilderness, they told the Han Power's envoy Chang-K'ien (see V. C (i) (c) 2, p. 143, footnote 2, above), when he overtook them at last, in 128 B.C., in Sogdiana (they had not, by then, yet troubled to cross the Oxus as well as the Jaxartes), 'that they were weary of trekking and fighting and only wanted to live in peace' (Tarn, W. W.: *The Greeks in Bactria and India* (Cambridge 1938, University Press), pp. 276–7) and that they were therefore unwilling to entertain the proposal, which the envoy had brought with him from the Court of Ch'ang Ngan, for a concerted convergent assault by the Yuechi and the Sinic Power upon their common enemies the Hiongnu. The first of the five Yuechi war-bands to recover from this lassitude were the Kushans. By about 50 B.C. we find the Kushans not only across the Oxus, but also across the Hindu Kush, on the northern edge of the basin of the Kābul River, somewhere between the Panjshir district and Chitral (Tarn, op. cit., pp. 342 and 506); and the energy which had carried them thus far afield in less than 80 years since the date of Chang-K'ien's visit moved them to respond to the call of a later envoy of the Sinic Power, who was successful in mobilizing the Kushan chief Miao to fight for the local Greek prince Hermaeus against the Parsians of Cōphēnē (see V. C (i) (c) 2, p. 133, footnote 1, above). Miao's descendant and eventual successor Kadphises I (*regnabat post A.D. 25 to A.D. 50*) united all five Yuechi war-bands under Kushan leadership and conquered the country of the Paropamisadae (see loc. cit.). The conquest of Taxila, the capital of the Western Panjab, followed circa A.D. 60–4 (Tarn, op. cit., p. 353, footnote 1) in the reign of Kadphises II (*regnabat circa A.D. 50–68*); and the second Kadphises' famous successor Kanishka (*regnabat circa A.D. 78–123*) reigned, from Jaxartes to Ganges, over an empire as extensive as the Bactrian Greek prince Demetrius's in 183–175 B.C. (see loc. cit.). By the time, however, when the Kushans were making their conquests in India, they were no longer barbarians but were authentic and self-conscious heirs of the by then almost extinct Far Eastern Greeks.

the Parthian deep sea straight ahead—evaded annihilation by swerving south-eastward and throwing themselves upon the Indian provinces of a Greek Power in the Far East which had been weakened by becoming divided against itself before being smitten by the impact of the Yuechi upon its Transoxanian frontier facing the Eurasian Steppe.¹ After winning and losing an ephemeral dominion (*circa* 110 B.C.—A.D. 19) in the Indus Valley, these Saka Nomad barbarian intruders on Indic ground succeeded in taking permanent possession of the plateaux of Mālwa (*circa* A.D. 78) and Mahārāshtra (about, or shortly before, the middle of the second century of the Christian Era).² The overthrow of the last of the Saka 'satraps' in Western India at some date between A.D. 388 and A.D. 401 was the decisive act in the restoration of the Indic universal state by the Guptas.³

The Saka Nomad incursion into Indic history during the interlude between the Maurya and the Gupta régimes was not, however, the last Indic social catastrophe of the kind; for, while we have no sure evidence of Nomad assaults upon the Indic World during the Indic 'Time of Troubles' which preceded the foundation of the Maurya Empire by Chandragupta (*imperabat* 322–298 B.C.), a succession of Nomad invasions is a prominent feature of the post-Indic interregnum which set in after the death of the Gupta Emperor Skandagupta (*imperabat* A.D. 455–*circa* A.D. 480).⁴ On this occasion the history of the preceding Nomad assault upon India repeated itself, with the Huns playing the Sakas' part.⁵

The last quarter of the fourth century of the Christian Era saw the advent of a bout of apparent aridity⁶ and manifest effervescence on the Steppes which, on the sector of the steppe-coast between the Khingan Range and the Tien Shan, was signalled by the menacing emergence of the Juan Juan horde above the northern horizon of the Sinic World.⁷ At the opposite extremity of Eurasia the same troubling of the waters of Nomadism declared itself with greater violence in a simultaneous outbreak of the Huns between

¹ For a discussion of the route, and the stages, by which the Sakas reached their Indian destination, see V. C (i) (c) 3, Annex II, pp. 602–3, below.

² For these conquests of the epigoni of the original Saka invaders of India see V. C (i) (c) 3, Annex II, pp. 603–4, below.

³ See Smith, V. A.: *The Early History of India*, 3rd edition (Oxford 1914, Clarendon Press), pp. 290–2. For the part which the Sakas may have played in the evolution of both the Sanskrit and the Iranian Epic, see V. C (i) (c) 3, Annex II, below.

⁴ It will be noticed that the post-Indic interregnum (*circa* A.D. 475–775) partly coincided in time with an apparent bout of aridity (and therefore of effervescence) on the Steppes which may have prevailed from about A.D. 375 to A.D. 675 (see Part III. A, Annex II, vol. iii, p. 414, above).

⁵ This historical parallel has been noticed already in Part III. A, Annex II, vol. iii, p. 449, above.

⁶ For this bout, which may have prevailed from *circa* A.D. 375 to *circa* A.D. 675, see Part III. A, Annex II, vol. iii, p. 414, above.

⁷ See the present chapter, p. 273, above.

the Pamirs and the Caspian and between the Caspian and the Urals.¹ Perhaps the most convincing explanation of the origin of these several Nomad offensives which were so widely dispersed in Space yet so closely synchronous in Time is to see in them the uniform effects of a single physical cause which was in operation on—and all over—the Steppe itself; but in attempting to account for the diversity of the subsequent fortunes of the several erupting hordes, after they had left their native Sieppes behind and had invaded the domains of their sedentary neighbours, we have to look for an explanation in human instead of in physical terms, and we shall find it in the diverse conditions, at the time, of the different sedentary societies with which the Nomad invaders collided.

The Juan Juan, for example, were prevented from penetrating beyond the fringes of the Sinic World by the resistance of those 'successor-states' of the United Tsin Empire that had been founded in the marches by the Juan Juan's own forerunners the Sien Pi and Hiongnu and To Pa; for these *ci-devant* Nomad principalities served as effective buffers against the next wave of Nomad invasion. On the other hand the principality which the Gothic sedentary barbarians from Northern Europe had established in the Ukraine,² between the main body of the Eurasian Steppe and the Lower Danube frontier of the Roman Empire, during the foregoing bout of apparent humidity and manifest quiescence,³ not only failed to break the shock of the impact of the Huns upon the Hellenic World but actually caused this shock to be more profoundly felt and the blow to strike deeper; for the Hun explosion blew the Gothic principality to pieces, and the flying fragments made breaches in the Roman *limes* through which the Nomad horsemen were able to ride unhindered.⁴ Under the leadership of Attila (*dominabatur circa* A.D. 433-453) the right wing of the Hunnish horde, which had taken the road between the Caspian and the Urals, was able to penetrate, in the track of the exploded Goths, into the heart of the Roman Empire before the united efforts of Goths and Romans succeeded in flinging the Nomads back into the Steppes from which they had issued. Meanwhile the White Huns or Ephthalites, who formed the left wing of the erupting Hunnish horde, had parted company with their comrades-in-arms in order to take the alternative road between the Caspian and the Pamirs; and on this road they met with

¹ For the synchronism between the eruption of the Huns and the emergence of the Juan Juan see Part III. A, Annex II, vol. iii, p. 423, above.

² See Part III. A, Annex II, vol. iii, p. 426, above.

³ For this bout see Part III. A, Annex II, vol. iii, p. 413, above.

⁴ See p. 220, above.

experiences which were different, again, from those of Attila's Huns in Europe as well as from those of the Juan Juan in the Far East.

The sedentary societies which the Juan Juan and the Black Huns found in their path happened, at the time, to be in an advanced stage of dissolution. At the turn of the fourth and fifth centuries of the Christian Era the Hellenic Society was approaching, in Europe,¹ the end of its universal state, while the Far East was floundering in the trough of a post-Sinic interregnum. On the other hand, in contemporary South-Western Asia the Syriac Civilization was at this time in process of recovery from the stunning blow of a Hellenic assault. It was at last regaining the upper hand, and was preparing to complete its half-fulfilled task of evicting the intrusive Hellenic Civilization from the Syriac domain. The political instrument of this cultural rally was the Sasanian Empire;² and this young and militant Power was a much more formidable antagonist for the Huns than an old and weary Roman Empire. When they broke out of the Desert into the Sown on the Pamir-Caspian front, the White Huns overthrew the 'successor-states' of the Kushan Empire in the Oxus-Jaxartes Basin as easily as, in the same region some five hundred years before, the Bactrian Greek Empire had been overthrown by the Sakas and the Yuechi; but beyond the Oxus and the Murghab, at the foot of the Khurasanian escarpment of the Iranian Plateau, the new invaders found the Sasanian Power waiting to receive their attack as the Arsacid Power had once stood on the same line to withstand the Sakas. In this second battle, on the same field, between Iran and Turan, the representative of the sedentary civilization was once again victorious; and, as before, his Nomad assailant swerved aside into India³ when he found his line of advance into South-Western Asia blocked by a resistance which he was unable to overcome.

The first Hun attack, across the Hindu Kush, upon the Gupta Empire appears to have been delivered at the moment of Skandagupta's accession in A.D. 455; and this attack was repulsed. But in the last decade (*circa* A.D. 470-480) of Skandagupta's reign, when the restored Indic universal state was verging towards its fall, the Nomad assault was renewed in greater force and with greater persistence; and, when the Gupta Empire broke up after Skandagupta's death, the Hun invaders maintained for half-a-

¹ For the differentiation, in the course of the fifth century of the Christian Era, between the simultaneous responses of an identic Roman Empire to identic challenges in its western provinces and in its central and eastern provinces respectively see IV. C (iii) (c) 2 (β), vol. iv, pp. 323-6, above.

² See p. 216, above.

³ For the history of this Hun invasion of India during the post-Indic 'Time of Troubles' see Smith, V. A., *op. cit.*, pp. 309-23.

century (*circa* A.D. 480–528) a reign of terror in India¹ in which the war-lord Mihiragula (*militabat circa* A.D. 510–540) played Attila's part. Like his Black Hun cousin, this White Hun 'Scourge of God' made himself so intolerable that he drove the rival successors of the Empire on whose domain he was trespassing to make common cause against him; and the reverse which Mihiragula suffered *circa* A.D. 528 at the hands of Bālāditya and Yasodharman² was more severe than that which had been inflicted upon Attila by Aetius and Theodoric. But it was neither the defeat nor the death of the Ephthalite invader that gave a devastated Indic World security against a repetition of the calamity. The ravaging of India by the White Huns was only brought to an end when this first wave of the Nomad flood in the ebullition of A.D. 375–675 was followed by a second. Between A.D. 563 and A.D. 567 the Turks burst out of the Steppe into the Oxus-Jaxartes Basin and succeeded—in alliance with the Sasanid Power, which thus revenged the disaster of A.D. 484—in annihilating the Ephthalites in their home territory, without pushing their own conquests farther in the direction of India than the Kābul Valley.³

Evidence from the New World.

In passing from the Old World to the New, we shall find ourselves handicapped again—as we have been handicapped in attempting to review the Indic 'Time of Troubles'—by a dearth of evidence.

In the history of the disintegration of the Andean Civilization, for example, we can catch no more than a glimpse or two of the relations between a dominant minority and an external proletariat before we reach the date of the establishment of the Andean universal state. We have already observed⁴ that the Incas trained themselves for the task of empire-building by serving as the wardens of the marches of the Andean World against the savages in the forests of Amazonia, and we may now observe that the Chancas—who came nearer than any of the

¹ The Ephthalites won a free hand to concentrate their marauding energies upon India when, in A.D. 484, they defeated and killed the Sasanian Pādīshāh Pīrūz, who had rashly attacked them on their own ground in the Oxus-Jaxartes Basin, instead of being content with his predecessors' achievement of holding the frontier of Khurāsān.

² See Smith, V. A., *op. cit.*, p. 318.

³ That is, if the Gurjara Nomads—whose descendants we find established in North-Western India in a later age (see II. D (v), vol. ii, p. 130, footnote 3, above)—were not a spill-over from the crest of this Turkish wave when it broke against the Hindu Kush. In the Hindu records the Gurjaras are mentioned in association with the Huns (see Smith, V. A., *op. cit.*, pp. 321–2), and the most natural inference would be that they were an allied horde which descended upon India in the same avalanche as the Huns themselves; but the association may signify no closer relationship between Huns and Gurjaras than is involved in the facts that both were Nomads and that both entered India in the course of the post-Indic interregnum (*circa* A.D. 475–775).

⁴ In II. D (v), vol. ii, pp. 206–8, above.

Incas' other Andean adversaries to cutting the Incas' career of conquest short¹—are believed to have been the descendants of barbarian intruders of Amazonian origin. In the last days of the Inca Empire, on the eve of the Spanish conquest, we find that, in addition to the Amazonian front, the Andean universal state had two other anti-barbarian frontiers to defend: one at the south-eastern escarpment of the plateau (on the edge of the highlands that are now included in the south-eastern extremity of Bolivia and in the north-western extremity of Argentina) and the other on the Pacific sea-board at the line of the River Maule (in what is now Chile). Both the Araucanian barbarians beyond the Maule and the Guarani barbarians in the Chaco were as warlike as the Amazonian savages;² and on the Chaco front the Inca Power had to cope, in A.D. 1526, with a Guarani invasion³ which penetrated farther than the Guaranis' Paraguayan descendants ever succeeded in advancing in their war with Bolivia some four hundred years later.

As for the Mexic World, the Aztec Power, which was on the point of establishing a Mexic universal state at the moment when the Spanish conquerors arrived on the scene,⁴ had arisen, like the Inca Power in the Andean World, in an anti-barbarian march.⁵ While Cuzco was a frontier-fortress against the savages of the Amazonian forest, Tenochtitlan was a frontier-fortress against the barbarians of the North American desert; and the Aztec masters of Tenochtitlan were themselves the descendants of barbarian interlopers from beyond the pale.⁶

We may add that, in the Spanish Viceroyalty of New Spain, as in the Spanish Viceroyalty of Peru, the alien usurpers found themselves compelled to assume responsibility for a conquered commonwealth's anti-barbarian fronts as the price for their seizure of the spoils of victory.⁷ While in South America the *conquistadores* had to carry on the Incas' warfare with the Amazonians

¹ See II. D (iv), vol. ii, pp. 102-3, above.

² See Baudin, L.: *L'Empire Socialiste des Inka* (Paris 1928, Institut d'Ethnologie), p. 211.

³ See Baudin, op. cit., pp. 44 and 168; Nordenskiöld, E.: 'The Guarani Invasion of the Inca Empire in the Sixteenth Century' in *The Geographical Review*, August 1917.

⁴ See IV. C (ii) (b) 2, vol. iv, p. 105, above.

⁵ See II. D (v), vol. ii, pp. 206-8, above.

⁶ It will be seen that the Aztecs were the Mexic counterparts of the Chancas and not of the Incas; and, if the decisive battle of Sacsahuana (see II. D (iv), vol. ii, p. 103, above) had ended in a Chanca victory, the course of Andean history from A.D. 1347 onwards might have been characterized by that brutality which was conspicuous by its presence in the Aztecs and by its absence in the Incas. See further V. C (i) (c) 4, p. 357, below.

⁷ Just as the Romans had to take over the Etruscan frontier in Northern Italy and the Carthaginian frontiers in the Iberian Peninsula and North-West Africa and the Macedonian frontier in the Balkan Peninsula and the Seleucid frontiers against the Arabs and the Parthians (see II. D (v), vol. ii, pp. 161-4, and the present chapter and volume, pp. 215-16, above).

and Guaranis and Araucanians, in North America they had to carry on the Aztecs' warfare with the even more ferocious Apaches and Comanches.¹

Evidence from the Eurasian Steppe.

Before we extend our survey from extinct to extant civilizations, we may notice several examples of the phenomena with which we are now concerned—namely, the secession of external proletariats and the delivery of barbarian counter-offensives—in the histories of certain Nomad Powers which have extended their rule over sedentary populations on the fringe of the Steppe and have thereby liberated themselves from the Nomadic Society's peculiar destiny of being a civilization without a history,² but have won this liberty at the price of exposing themselves to those perils of breakdown and disintegration that beset the path of growth.

In another context³ we have detected the plot of a drama in three acts—quiescence, prosperity, and demoralization—which has been performed on at least three distinct occasions when a Nomad horde has erupted out of the heart of the Eurasian Steppe into its Great Western Bay and has there established a political ascendancy over the sedentary primitive societies in the Northern Forest, while itself falling under the cultural ascendancy of one or more of the sedentary civilizations of the South. In a different context, again,⁴ we have observed that Nomad empires *in partibus agricolarum* carry within themselves the seeds of their own rapid decay, and that the evil day is merely postponed, without being averted, for those Nomad empires on the Great Western Bay of the Eurasian Steppe whose rulers have embarked on the dangerous experiment of substituting human for horned and hooved cattle without committing the further folly of transferring their own habitation from the Desert to the Sown.⁵ In the end the Royal Scythians and the Khazars and the Golden Horde, who dominated their sedentary subjects from a base of operations on the Steppe, each travelled the same road to destruction as their respective cousins and contemporaries the vagrant Scythians, who terrorized South-Western Asia for less than a hundred years in the seventh and sixth centuries B.C., the Pseudo-Avars, who terrorized Central and Eastern Europe for perhaps less than fifty years in the sixth and seventh centuries of the Christian Era, and the Il-Khans, who in the thirteenth and fourteenth centuries

¹ The extraordinary conservatism of Spanish military technique on this North American anti-barbarian front has been noticed in III. C (i) (a), vol. iii, p. 136, above.

² For this aspect of Nomadism see Part III. A, vol. iii, pp. 7-22, with Annex II, above.

³ In Part III. A, Annex II, vol. iii, pp. 428-30, above.

⁴ In Part III. A, vol. iii, pp. 22-5, above.

⁵ See Part III. A, vol. iii, p. 25, footnote 8, above.

reigned for less than eighty years over Iran and 'Irāq. And in the decline and fall of each of the three marginal steppe-empires we can observe the phenomena that have become familiar to us in our survey of sedentary societies. In these steppe-empires, too, an external proletariat duly secedes from a Nomad dominant minority and eventually passes over from the defensive to the offensive in the resulting warfare between the two fractions of a house divided against itself.

The Golden Horde had a special name—Qāzāq¹—for the contumacious barbarian who hovered or lurked, just out of range of the Horde's long whip-lash,² on the fringes of the vast appanage of Chingis Khan's eldest son Jūjī: a steppe-empire which extended, at its widest, from the Altai Mountains to the Iron Gates and from the Sea of Aral to the Gulf of Finland, and which exercised a suzerainty over the Iranic sedentary community of Khwārizm (Khiva) on one flank and over the Orthodox Christian sedentary society in Russia on the other.³ This technical term for the external proletariat of the long since vanished Golden Horde has survived down to the present day as the national name of two separate communities which differ from one another

¹ The word is a regular substantival formation from the Turkish verb *qāzmaq* meaning 'to dig'. Its technical significance in the political vocabulary of the Khans of the Golden Horde is an almost exact equivalent of 'External Proletariat' in the sense in which that term is used in this Study. (For this sense of the term 'Qāzāq' see Czaplicka, M. A.: *The Turks of Central Asia in History and at the Present Day* (Oxford 1918, Clarendon Press), p. 38.) This usage of the nickname 'Diggers' to describe the external proletariat of the Golden Horde suggests that the section of this external proletariat to which the term was first applied must have been some agricultural population—e.g. the Cossacks of the Dniepr (compare the Scythae Arotēres or 'Ploughboy Scythians', and the Scythae Geōrgoi or 'Agriculturist Scythians', who were to be found in the fifth century B.C. up the River Dniepr on the fringe of the Nomad Scythians' pastures, according to Herodotus, Book II, chaps. 17 and 18)—and that the technical sense of the term must eventually have eclipsed its etymological meaning so completely that it could come to be applied to *all* sections of the external proletariat alike—whether they happened to be sedentary communities like the Dniepr Cossacks (see II. D (v), vol. ii, pp. 155-7, above) or Ishmaelites like the Kirghiz Qāzāqs who, so far from being diggers in the literal sense, were more capriciously vagrant than the more or less disciplined Nomads who took their orders from the Khans of the House of Jūjī.

² See Herodotus, Book IV, chaps. 1-4, for the story of how the Scythians eventually broke the *moral* of their rebellious serfs—who had fortified themselves in a Crimean fastness masked by a dyke and flanked by the mountains and the sea—by laying aside their spears and bows and taking to their horsewhips. 'So long', observed the Scythian psychologist who recommended this gesture, 'as they have seen us bearing arms against them, they have felt on an equality with us, but when they see us armed with whips instead of weapons they will remember that they are our slaves, and when they realize this they will no longer be able to face us in the field.' According to the tale, the baffled Scythians took the psychologist's advice, with the precise result which he had predicted.

³ For the extent of Jūjī's appanage see I. C (i) (b), Annex I, vol. i, p. 373, and ii. D (v), vol. ii, pp. 145 and 146-7, above. This steppe-empire was founded between A.D. 1219, when the Mongols erupted westwards through the Zungarian Gap, and A.D. 1241, when they raided, but withdrew from, Hungary. It may be said to have come to an end when Shaybāni Khān Uzbek, the leader of the last intact troop of the Golden Horde, abandoned the Steppe and plunged into Transoxania in A.D. 1500, and when the head-quarters of the Golden Horde at the Saray on the Volga were captured in A.D. 1502 by the Mongols' former tributaries the Muscovites (see I. C (i) (b), Annex I, vol. i, pp. 372-4, above).

profoundly in origin and in culture but which nevertheless have in common an identic historical experience which their common name commemorates. Either of these still living peoples is derived from a wing of the long since extinct Golden Horde's external proletariat, and between them they have now occupied almost the whole of the Qipchāq Steppe which was once the Golden Horde's preserve. The Turkish-speaking 'Kirghiz Qāzāq' Nomads,¹ who range to-day from the left bank of the Irtysh to the left bank of the Lower Volga, and who have given their name to a Qāzāq Soviet Socialist Republic which was one of eleven direct constituent states members of the Soviet Union according to the Constitution of the 5th December, 1936,² are descended from Nomad outlaws who once hovered on the Baraba Steppe, on the farther side of the Irtysh, where the writ of the Khan at Saray-on-Volga did not run. The Russian-speaking Orthodox Christian Cossack husbandmen and watermen, whose cantonments were strung along the banks of the Eurasian rivers, from the Don to the Ussuri, until the Russian Communist revolution broke them up, are descended from sedentary outlaws who once lurked, under the nose of the Khan at Saray, in their water-girt 'Sich' on an island in the Dniepr.³ The convergent Qāzāq counter-offensive from both flanks, to which the Golden Horde eventually succumbed, seems to have been opened in the latter part of the fourteenth century of the Christian Era and to have triumphed before the end of the sixteenth.

If we now examine the history of the Royal Scythians and the Khazars in the light of this barbarian counter-offensive which signalized and expedited the decline and fall of the Golden Horde, we shall find counterparts, in either case, of both the Cossacks and the Kirghiz Qāzāqs. The respective Nomad outlaws who eventually broke into the Scythians' and the Khazars' preserves out of the hinterland on the Steppe were the Sarmatians and the Pechenegs;⁴ the respective sedentary outlaws who broke in out of the hinterland covered by the Northern Forest were the Bastarnae and the Varangians.⁵ And, just as, after the dissolution of the Golden Horde at the beginning of the sixteenth century of

¹ 'The Kirghiz Qāzāqs' are so named by the Russians in order to distinguish them from the Russian Cossacks on the one hand and from the Qāra Kirghiz on the other hand; but the so-called Kirghiz Qāzāqs speak of themselves as 'the Qāzāqs', *par excellence*, with no distinctive additional epithet.

² See the English text of the Constitution (Fundamental Law) of the Union of Soviet Socialist Republics adopted [on the 5th December, 1936] at the Extraordinary Eighth Congress of Soviets of the U.S.S.R. (Moscow 1937, Co-operative Publishing Society of Foreign Workers in the U.S.S.R.), chap. 2, arts. 13 and 28.

³ For the Cossacks see II. D (v), vol. ii, pp. 155-7, above.

⁴ See Part III. A, Annex II, vol. iii, pp. 426-30 and 441-3, above.

⁵ See II. D (vii), vol. ii, p. 349, with Annex VI, and Part III. A, Annex II, vol. iii, p. 426, above.

the Christian Era, the Cossacks met and fought the Kirghiz Qāzāqs for the possession of the derelict steppe, so the Bastarnae contended with the Sarmatians after the fall of the Royal Scythians, and the Varangians with the Pechenegs (and with the Ghuzz and the Cumans¹ who followed at the Pechenegs' heels) after the fall of the Khazars.

Of the three Nomad empires on the Great Western Bay of the Eurasian Steppe that are here under consideration, the Empire of the Khazars is the most interesting—and this not only in itself but also in virtue of the reaction which it evoked from the transfrontier barbarians in the Northern Forest and on the farther side of it.

The Khazars were deposited at the mouth of the Great Western Bay, between the Lower Volga and the Lower Don, about the middle of the sixth century of the Christian Era, by the same explosion that blew the [Pseudo-]Avars into the Hungarian Alföld and the Magyars into the Black Sea Steppe between Don and Dniestr and the Turks into the Oxus-Jaxartes Basin; and at the moment of their simultaneous emergence above the horizon of the neighbouring sedentary societies the Khazars gave no sign that they had any greater capacity for civilization than these other Nomads in front of them or than the Pechenegs and Ghuzz and Cumans in their rear. In the seventh century of the Christian Era the Khazars still wore a savage mien for the Azerbaijani peasants whose fields they ravaged as mercenaries in Heraclius's expeditionary force, or for the citizens of Constantinople whose dethroned tyrant-emperor Justinian II consoled himself for his banishment to the Crimea by marrying a Khazar princess. The Khazars were, indeed, one of the scourges of an age which was a time of tribulation for the civilizations of the South. In the eighth century, however, both the nascent Orthodox Christian Society and the senescent Syriac Society began to see better days. Orthodox Christendom coped with its problems by conjuring up a ghost of the Roman Empire; and, although the East Roman Empire eventually became a disastrous incubus,² the first effect of its establishment was to give an impetus to the development of the Orthodox Christian Civilization. Simultaneously in the Syriac World the Umayyad Caliphs emulated and surpassed both the work of Leo Syrus and the work of the Achaemenidae by incorporating the whole of the Syriac Society's domain into a

¹ *Alias* Qipchāq, after whom, as the horde whom they dispossessed (or, it might be more accurate to say, subdued and incorporated), the Mongol Golden Horde named the vast expanse of steppe, between the western foot of the Altai and the eastern foot of the Carpathians, which became Jūji Khan's appanage.

² See IV. C (iii) (c) 2 (β), vol. iv, pp. 320-408, above.

single universal state extending from Andalusia in one direction to Transoxania in the other.¹ After the completion of the Arab conquest of the Oxus-Jaxartes Basin in A.D. 741 Khazaria was subjected to a concentric fire of Orthodox Christian cultural radiation from the south-west, across the Black Sea and the Caucasus,² and Syriac cultural radiation from the south-east, across the Steppe; and, under this bombardment, the Khazars underwent a social transformation which was profound as well as rapid. About the middle of the century they abandoned their primitive paganism for the Jewish Faith,³ and changed themselves from warlike Nomads who sold their military services in the South into peaceful men of business who hired Southern mercenaries to police their cities and trade-routes.

This self-metamorphosis of the Khazars in the middle of the eighth century of the Christian Era was a remarkable achievement for a Nomad horde; but it was also a hazardous adventure; for at the moment when they were abandoning their ancestral military tradition the Khazars were acquiring an empire, beyond the borders of their native Steppe, which was bound sooner or later to become a serious military commitment. The cause of the change in the Khazars' way of life had been a taste for the profits of commerce, and the motive had been a desire to reap these profits to the full. The strength of the Khazars' trading position lay in their geographical situation midway between the luxury-markets of Constantinople and Baghdad and the Southern furrriers' source of supply in the Northern Forest; and from the middle of the eighth century onwards⁴ the Khazar *coureurs des bois* pushed their way up the Dniepr and over the portage to the northern waters that descended into the Baltic—imposing on the Slav inhabitants of the woods a tribute of furs and wax, and setting up trading-posts which soon turned into embryonic city-states with a measure

¹ See pp. 240-1, above.

² For this early cultural expansion of Orthodox Christendom north-eastward, which was one of the first symptoms of the emergence of a new Orthodox Christian Civilization, see I. C (i) (b), vol. i, p. 64, above.

³ See II. D (vi), Annex, vol. ii, p. 410, and Part III. A, Annex II, vol. iii, p. 429, above. The Khazars' choice of Judaism, in preference to either Orthodox Christianity or Sunni Islam, is probably to be interpreted as a deliberate and ingenious attempt to have the best of both worlds. They wanted to civilize themselves, and recognized that the necessary means to this end was the adoption of some 'higher religion'. At the same time they wanted to preserve their own distinct social identity, and therefore refrained from adopting either of the two 'higher religions' that were officially established in the two great sedentary empires next door to the Khazar Steppe. If this reading of the Khazars' conversion to Judaism is correct, we may contrast their deliberate acquisition of a distinctive 'higher religion' in the eighth century of the Christian Era with the Eastern Teutons' accidental achievement of the same result through their conversion to Arianism in the fourth century (see pp. 227-9, above).

⁴ The date is established by finds of Arab coins in the Dniepr Basin—if we may assume that these coins were brought by the Khazar pioneers (see Kliutschewskij, W. [Kluchevski, V.]: *Geschichte Russlands*, vol. i (Berlin 1925, Obelisk-Verlag), pp. 122-3).

of political command over their respective commercial hinterlands.¹

This Khazar penetration of the Russian sector of the Northern Forest is recorded to have been eminently peaceful; and the finds of Arab coins² in the region which the Khazars thus opened up suggests that even the 'tribute' may have been of the nature of a voluntary commercial transaction rather than a toll exacted by an assertion of superior physical force. In this respect the Khazars' activities in their new dominion compare favourably with Charlemagne's contemporary work in the westernmost sector of the Forest, where the Austrasian empire-builder was setting himself to subjugate the Saxons to Frankdom, and to convert them to the Christian Faith, by sheer violence, and was thereby evoking a desperate resistance from his victims.³ In one respect, however, the Khazars' advance from the northern fringe of the Steppe to the northern slope of the watershed between the Black Sea and the Baltic resembled both Charlemagne's simultaneous advance from the Rhine to the Eider and the Etruscans' advance, in another age, from the west coast of Italy to the southern foot of the Alps.⁴ Like these other two unfortunate adventures, the Khazar enterprise was an intrusion upon a boundless barbarian world in which the rash intruder had not the staying-power or the strength to find safety by pushing on to a 'natural frontier', so that he was condemning himself to evoke a barbarian counter-movement which he lacked the power to meet and stem.⁵ The Khazars' experience was to demonstrate that the nemesis of a hasty advance 'into the blue' was much the same, whether the forward movement itself had been pacific or militant.

While the Slavs appear to have been as pacific in the eighth and ninth centuries of the Christian Era as the Khazars were in that age and as the Slavs' own ancestors had shown themselves in A.D. 591,⁶ the Khazars' progress through the forests, from the landward fringe of the Black Sea Steppe towards the Continental coast of the Baltic, had brought their northernmost outposts within range of the warlike barbarians of Scandinavia, who at

¹ Kluchevski, *op. cit.*, German translation, vol. i, pp. 120-1 and 131. The opening-up of the Russian forests by the Khazar fur-traders in the eighth and ninth centuries of the Christian Era may be compared with the opening-up of the North American forests by the French-Canadian fur-traders in the eighteenth and nineteenth centuries. The geographical location of Kiev-on-Dniepr, which became the *entrepôt* of the Russian fur-trade, corresponds to that of Montreal *mutatis mutandis*—that is to say, with the geographical role of the Gulf of St. Lawrence being played by the Great Western Bay of the Eurasian Steppe.

⁴ See II. D (vii), vol. ii, pp. 276, 280, and 345, above.

⁵ A number of illustrations of the historical 'law' that can be seen here in operation have been given on p. 209, footnote 3, above.

⁶ See the incident cited in II. D (vii), vol. ii, p. 318, above.

this very moment were being awakened from their 'heavy winter dream'¹ by Charlemagne's provocative hammering upon their southern gate. The Arab coins that, under Khazar auspices, had made their way, salmon-wise, up the Dniepr cataracts travelled on over the portage and down the northern waters and across the Baltic until they came into Scandinavian hands in Rothrsland—the seaboard of Sweden in the neighbourhood of Stockholm.² And, while the main body of the Vikings launched their ships on the waters of the North Sea and sought their fortunes on the coasts of France and the British Isles and Iceland, there were other Scandinavian ships'-companies that set sail upon the Baltic to trace the alluring dirhems and dinars to their Khazar source.

According to the legend,³ these Rothrslanders—or Rhôs, as their name was contracted by their victims—came in as peacefully as the Khazars had come before them when they made their first lodgement on the Russian ground that has inherited their Swedish name. It is as difficult to identify the moment, in the early part of the ninth century, at which these Swedish 'warings' or 'varangians' superseded the Turkish Khazars in the effective control of a Slav Novgorod and a Slav Kiev as it is to say exactly when the Achaeans superseded the Mycenaean at Mycenae and Tiryns during the decline of the Minoan 'thalassocracy'.⁴ It is certain, however, that from the beginning—whatever the exact date may have been—the Varangian régime in the forest country differentiated itself from the preceding Khazar régime by taking to violence instead of emulating the Khazars' gentleness.

Violence had, indeed, already gained the upper hand in the heart of the Khazar dominions before the first Varangian fighting trader—or trading pirate⁵—broke out of the forest on to the Steppe in his descent of the Dniepr. The fortress of Sarkel which was built by East Roman military engineers for an already hard-pressed Khazar Khāqān about the year 835⁶ had not availed to hold at bay the other Qāzāqs on the Khazars' opposite anti-barbarian frontier; and we have seen⁷ how, some fifty years later, the Khāqān's ingenious attempt to catch the Transvolgan Pechenegs between two fires and thus annihilate them merely resulted in precipitating the Pecheneg 'break-through' which the Khazar statesman had dreaded. Although the last strongholds of the

⁵ The delicate distinction is discussed in Kluchevski, op. cit., German translation, vol. i, p. 129.

⁶ Kluchevski, op. cit., German translation, vol. i, p. 125.

⁷ In Part III. A, Annex II, vol. iii, pp. 441-3, above.

Khazars at the mouths of the Volga and the Don did not fall into the hands of Russian raiding-parties till as late as about A.D. 966,¹ the widespread Khazar Empire which had been established in the eighth century had ceased to exist by the time when, in the last decade of the ninth century, a Pecheneg horde which had driven all its Nomad competitors off the Steppe between the right bank of the Don and the left bank of the Lower Danube collided, along a line that ran a day's journey south-east of Kiev,² with a Scandinavian principality, seated in that city, which had already established its hegemony over the kindred Scandinavian principalities in its rear as far to the north as the shores of Lake Ladoga.³

The Scandinavian war-bands⁴ which thus usurped the Khazars' heritage⁵ in the Northern Forest in the course of the ninth century of the Christian Era display, beyond mistake, the now familiar features of an external proletariat in its hour of triumph. While they were keen traders as well as fine fighters,⁶ they had lost their roots in the soil, and they left the task of cultivation, and also even the more lucrative craft of hunting and trapping, to their forest-born Slav subjects, who were sundered socially from their more sophisticated but also more ferocious Russian masters by a sharp cleavage.⁷ Moreover these barbarian invaders of the Khazar World have left an echo of their deeds and experiences in a 'heroic' poetry which sets its scene in the landscape of the Ukrainian Steppe, with the city of Kiev for its cynosure⁸—though the only places in which the oral tradition of chanting this poetry is known for certain to survive down to the present day are the Olonetz district, between Lakes Ladoga and Onega, at an extremity of the Varangian war-bands' former field of operations which is as remote as could be from Kiev, and the valley of the river Kolyma in North-Eastern Siberia, where the descendants of the most adventurous of all the post-Varangian Russian pioneers rub shoulders now on the Arctic Circle with the Palaearctic rear-guard of Primitive Mankind.⁹

¹ See Part III. A, Annex II, vol. iii, p. 427, above.

² Kluchevski, op. cit., German translation, vol. i, p. 159.

³ For the establishment of the supremacy of Kiev over the other Scandinavian 'successor-states' of the Khazar Empire see Kluchevski, op. cit., German translation, vol. i, pp. 144-8.

⁴ For an account of these Varangian war-bands, which came to be known as *drushinas* in the Slavonic tongue of the subject population which they had captured; like cattle, from the Khazars, see Kluchevski, op. cit., German translation, vol. i, pp. 197-9.

⁵ The fact that these Scandinavian war-lords regarded themselves as successors of the Khazars is demonstrated by their adoption of the Khazar title *Khāqān* (see Kluchevski, op. cit., German translation, vol. i, p. 161).

⁸ Chadwick, N. K.: *Russian Heroic Poetry* (Cambridge 1932, University Press), p. 25; Chadwick, H. M. and N. K.: *The Growth of Literature*, vol. ii (Cambridge 1936, University Press), pp. 23-5, 81, and 93-4.

⁹ See Chadwick, *Russian Heroic Poetry*, pp. 2-5; Chadwick, *The Growth of Literature*,

This Russian 'heroic' poetry is a living monument—remote though it be, to-day, in place as well as in time—of the Varangian war-bands' Völkerwanderung into the domain of the Khazar Empire in the ninth century of the Christian Era. Have other barbarian invaders of other steppe-empires been moved by the same experience to give proof of a similar creativity? The question may remind us that the only 'heroic' poetry of any consequence that is known to have existed in any Turkish language is that which can still be heard to-day on the lips of 'Kirghiz Qāzāq' minstrels¹ whose audience are descendants of the Nomad constituents of the external proletariat of the Golden Horde.²

The External Proletariat of the Main Body of Orthodox Christendom.

When we turn to the history of the Orthodox Christian Civilization, we find that the first of the barbarian offensives which the main body of Orthodox Christendom had to meet was that of the Varangians, whose flotilla of war-canoes bore down upon the Bosphorus out of the Black Sea in A.D. 860 as swiftly and unexpectedly as a swarm of wasps.³ These Russian barbarian invaders of the Orthodox Christian World cannot, however, be regarded as members of an external proletariat which had been generated by Orthodox Christendom itself; for, as we have seen, the stimulus that drove the Rothrslanders on to the war-path was proximately the Khazar penetration of the Northern Forest, and ultimately Charlemagne's aggressive war of extermination in Saxony, and was not any move that had been made by any Orthodox Christian dominant minority. The Varangian assaults on the East Roman and Bulgarian Empires in the ninth and tenth centuries of the Christian Era were incidental effects of the Scandinavian Völkerwanderung into the domain of the adjoining

vol. ii, pp. 10 and 11. The majority of the Russian heroic poems that were recaptured and reduced to writing in the middle of the nineteenth century—when the oral tradition was on the point of becoming extinct—through the labours of modern scholars, were heard in the Olonetz district.

¹ See Vambéry, Arminius: *Das Türkenvolk in seinen Ethnologischen und Ethnographischen Beziehungen* (Leipzig 1885, Brockhaus), pp. 292-8. For the vestiges of a 'heroic' poetry, centring round the figure of Köroghlu, among the Western Turks see Chodsko: *Specimens of the Popular Poetry of Persia as found in the Adventures and Improvisation of Kurroglu, the Bandit Minstrel of Northern Persia, and in the Songs of the People inhabiting the Shores of the Caspian Sea* (London 1842, Allen, for the Oriental Translation Fund).

² See pp. 282-3, above.

³ In the element of suddenness and surprise this Russian naval attack on Constantinople in A.D. 860 is reminiscent of the Gothic naval attack on the Black Sea coasts of the Roman Empire post A.D. 250 and of the Cossack naval attack on the Black Sea coasts of the Ottoman Empire post A.D. 1637 (for the intermittent occupation of the Great Western Bay of the Eurasian Steppe by bands of non-Nomadic barbarians from the Northern Forest see Part III. A, Annex II, vol. iii, pp. 426-8, above). According to Kluchevski (op. cit., German translation, vol. i, p. 127), there is evidence for Russian raids on the Black Sea coasts of the East Roman Empire at a date which must be earlier than A.D. 842.

Khazar Empire—just as the assaults of other sea-rovers upon 'the New Empire' of Egypt in the thirteenth and twelfth centuries B.C. were incidental effects of a Central European barbarian *Völkerwanderung* into the domain of the Minoan 'thalassocracy'.¹

In Egyptiac history this backwash from the foundering of a neighbour civilization inflicted serious damage, because the Egyptiac Society itself happened, at the time, to be in a far-advanced stage of decline and exhaustion in which it no longer possessed the necessary reserves of strength for meeting with impunity an unexpected call upon its energies.² On the other hand the Orthodox Christian Civilization was still in growth throughout the period which began with the East Roman Empire's repulse of the surprise attack of Askold's war-canoes in the Bosphorus in A.D. 860, and which culminated in the expulsion of Svyatoslav's war-bands from the Balkan Peninsula in A.D. 972 by the Emperor John Tzimiskēs;³ and the struggle did not end in either the overwhelming or the crippling of the East Roman Empire and the Orthodox Christian Civilization—as the Khatti Empire and the Hittite Civilization were overwhelmed, and 'the New Empire' and the Egyptiac Civilization were crippled, by the impact of the post-Minoan *Völkerwanderung*. Like 'the New Empire' of Egypt, and unlike the Empire of Hatti, the East Roman Empire proved to the rampant barbarians, on the battle-field, that it was stronger in arms than they were; but the defeated Varangians, unlike the defeated Philistines and Teucrians, were then quickly captivated by the civilization of the victors. The discomfiture of Svyatoslav in A.D. 972 was followed in A.D. 988/9 by the conversion of Vladímir;⁴ and, therewith, the Scandinavian 'successor-state' of the Khazar Empire in the Northern Forest was transmuted into a state-member of Orthodox Christendom, and the trading-post of Kiev into a Russian equivalent of Constantinople. This establishment of a new branch of Orthodox Christendom on Russian soil, which was achieved in the hour of the breakdown of the parent stem, was the last, but also perhaps the gréatest, creative act of the Orthodox Christian Civilization.⁵

¹ See I. C (i) (b), vol. i, pp. 93 and 100-1, and the present chapter and volume, pp. 236-7 and 269, above.

² See p. 269, with the references in footnote 4 on that page, above.

³ For Svyatoslav's overland invasion of the Bulgarian Empire in A.D. 969-72 see IV. C (iii) (c) 2 (β), vol. iv, pp. 389-90, above. According to Kluchevski, op. cit., German translation, vol. i, p. 153, the complete list of Russian attacks on the East Roman Empire is as follows: Askold's in A.D. 860; Oleg's in A.D. 907, Igor's in A.D. 941 and 944; Svyatoslav's in A.D. 971; Yaroslav's in A.D. 1043. It will be noticed that all of them except the last were anterior to the breakdown of the Orthodox Christian Civilization in A.D. 977.

⁴ See II. D (vii), vol. ii, pp. 352-3, above.

⁵ For the genesis of the Russian offshoot of the Orthodox Christian Civilization see I. C (ii), vol. i, pp. 132-4; II. D (iii), vol. ii, p. 80, footnote 2, and II. D (v), vol. ii, p. 154, above.

In forcing themselves upon the East Roman Empire in their alternating roles of pirates and traders, the Varangians were partly moved by the commercial motive of bringing to the market of Constantinople, by the water-route of the Dniepr and the Black Sea, the commodities which they collected in their annual tribute-taking tours of their subject territories in the Northern Forest.¹ But there was also perhaps a political motive which moved the war-lords without their being able to avow it to their war-bands. The most famous of the Varangian princes of Kiev, Vladimir the Great (*dominabatur* A.D. 980-1015), who was responsible, as we have seen, for the conversion of his henchmen and subjects to the Orthodox Christian religion and culture, seems to have been anxious to find an outlet for the formidable energies of the Scandinavian mercenaries who flocked into his camp on the Dniestr in embarrassing numbers; and his solution of the problem was to 'pass on' his superfluous warriors to the East Roman Empire without much caring whether they went as marauders or as mercenaries.² In the course of the eleventh century the same trick was played upon the East Roman Empire on a larger scale, and with more serious results for the victim, by two other neighbours: the rising Western Society on the north-west and the declining Syriac Society on the south-east. The French no doubt breathed a sigh of relief when the great-grandchildren of the Viking companions of Rollo, whom Charles the Simple had perforce accepted as settlers on French soil in A.D. 911,³ rode off across the Pyrenees in A.D. 1018 to fight for the Christian barbarians of the Iberian Peninsula against the Andalusian Umayyad Caliphate,⁴ and across the Alps in A.D. 1016 to fight for the Catholic Lombard rebels against the authority of the Orthodox East Roman Empire in Apulia.⁵ And in the next generation the Sunnī Muslims of Iran and 'Irāq were assuredly no less pleased when their Saljūq converts and conquerors began to look for pastures new in the Anatolian dominions of the infidel East Roman Empire in A.D. 1037,⁶ and in the Syrian dominions of the schismatic Fātimid Caliphate in A.D. 1071.⁷

This same year 1071—which saw the East Roman Emperor Romanus Diogenes taken prisoner by the Saljūqs on the field of Manzikert and the East Roman metropolis in Apulia, Bari, fall

⁵ For the Norman mercenaries whom Melo of Bari employed in his abortive incursion into East Roman territory in A.D. 1017-18 see IV. C (iii) (c) 2 (β), vol. iv, p. 392, footnotes 1 and 2, and p. 401, above.

⁶ See IV. C (iii) (c) 2 (β), vol. iv, p. 401, and the present chapter and volume p. 247, above.

⁷ See p. 247, above.

into the hands of the Normans¹—was a disastrous year in the history of the relations between the main body of Orthodox Christendom and the barbarians. These Norman and Saljūq barbarian invaders now carved out of a broken-down East Roman Empire the 'successor-states' which their Varangian forerunners had failed to carve out of an Orthodox Christian body social that was still in growth at the time when they were assailing it.² In one point, however, the Varangians and the Normans and the Saljūqs were all of a piece from the Orthodox Christian standpoint. They were all of them alien barbarians who had been 'passed on' into the Orthodox Christian World by the societies which had bred them. It was not until the Orthodox Christian 'Time of Troubles' (*saeuiebat circa* A.D. 975–1375) had entered upon its last and worst phase, after the Frankish sack of Constantinople in A.D. 1204, that Orthodox Christendom's homegrown barbarians began to play their part in the barbarian assaults upon a tortured and prostrated Orthodox Christian body social.

At the moment of the breakdown of Orthodox Christendom in A.D. 977 there were three directions in which the Orthodox Christian culture was being radiated out among barbarians, and in which it was therefore to be expected, on analogy, that anti-barbarian fronts would crystallize as the broken-down civilization went into disintegration. One of these barbarian thresholds of the Orthodox Christian World was in the Abruzzi, where Lombard Western Christian barbarians were absorbing the cultural influence, while they were kicking against the political suzerainty, of the East Roman Viceroyalty of Apulia. Another was in Armenia, where Gregorian Monophysite Christian barbarians—a Mleh³ and a John Tzimisce⁴—had been finding careers for themselves among the 'borderers' in the East Roman military service. There was also a third barbarian threshold in Jugoslavia and Albania, where the last survivors of the Continental European barbarians—Arnauts and Serbs and Bosniaks—were in relations with the Bulgarian Empire that resembled the relations of the Armenians and the South Lombards with the East Roman Empire. On two thresholds out of these three the front did not have time to form, since the Normans and the Saljūqs, breaking in from the back of beyond, respectively overwhelmed the Lombards and the Armenians and usurped their roles. It was only on the Continental European

¹ See IV. C (iii) (c) 2 (β), vol. iv, p. 392, footnote 2, above.

² Between the Varangian prince Svyatoslav's abortive invasion of the Balkan Peninsula in A.D. 969–72 and his Norman kinsmen's successful conquest of the Byzantine dominions in Italy in and after A.D. 1040 the main body of Orthodox Christendom had inflicted on itself the disaster of the Great Romano-Bulgarian War of A.D. 977–1019 (see IV. C (iii) (c) 2 (β), vol. iv, pp. 390–1, above).

³ See pp. 242 and 253–4, above. ⁴ See IV. C (iii) (c) 2 (β), vol. iv, p. 400, above.

front of the Bulgarian Empire that the home-grown external proletariat of the main body of Orthodox Christendom succeeded in the end in playing its normal part.

The Serb barbarians were the *tertii gaudentes* in the life-and-death struggle between the two principal Powers of the Orthodox Christian World. They were drawn, as humble allies of the East Roman Empire, into the Romano-Bulgarian War of A.D. 913-27;¹ and, although, after the East Roman victory in the Great Romano-Bulgarian War of A.D. 977-1019, 'the Serbs received for their reward what the Bulgars received for their punishment',² and were temporarily incorporated into the East Roman body politic, they fared better than the Bulgars in the next chapter of the story; for they recovered their political freedom more than a hundred years earlier³ and made greater play with it during the time that was at their disposal before Serbs and Bulgars and Greeks were all compelled to lie down with one another under a *Pax Ottomanica*.⁴ In the middle of the fourteenth century of the Christian Era, when the remnant of the revived Bulgarian Empire was in almost as miserable a state as the Nicene Greek principality which had reoccupied the East Roman Imperial Throne at Constantinople,⁵ the Serbian war-bands were marching down the valley of the Vardar and making themselves masters of that Macedonian hinterland of Salonica which had been the battle-field of Greeks and Bulgars for the past five hundred years. And, while the Serbs pushed on into Thessaly and beyond, as far as Thermopylae, the Albanians—now heard of for the first time in Orthodox Christian history⁶—were staking out

¹ See IV. C (iii) (c) 2 (β), vol. iv, pp. 385-6, above.

² To parody the famous epigram which was originally uttered apropos of the uniform repression to which the Croat loyalists and the Magyar rebels were subjected by the Hapsburg Government after the political convulsions of 1848-9 in the Danubian Monarchy.

³ The Serbs shook off the East Roman yoke *de facto* in, or soon after, A.D. 1081; the Bulgars not until A.D. 1186. The nominal suzerainty of the East Roman Government over the Serbs did, however, last until the death of the East Roman Emperor Manuel I Comnenus in A.D. 1180; and during the last thirty years of his reign (that is, since A.D. 1149) Manuel appears to have asserted his authority over the Serbs more effectively than any of his predecessors had asserted theirs since the loosening of the Empire's hold upon the western part of the Balkan Peninsula in consequence of the Norman invasion launched in A.D. 1081 by Robert Guiscard.

⁴ See IV. C (ii) (b) 2, vol. iv, p. 82, footnote 3, above.

⁵ For the role of these Nicene Greeks as forerunners of the 'Osmanlis see Part III. A, vol. iii, p. 27, above.

⁶ It is impossible to say that this was the first time that the Albanians had intervened in the history of any civilization, since we may guess that their ancestors had played a part in Hellenic history. We do not know, however, whether it is from the Illyrians or from the Thracians that the Albanians are physically descended. On *prima facie* geographical grounds we might be inclined to trace the Albanians' ancestry back to the Illyrians, whose national home in the Hellenic Age included the Albanians' present habitat. On the other hand the linguistic evidence points rather to a Thracian pedigree for the Albanians, since the Albanian, like the Thracian, language is unquestionably a member of the Satem-group of the Indo-European Family, whereas the Illyrian language appears to have belonged to the Centum-group, to judge by the extant monuments of the Venetic and Messapic dialects of the Illyrian settlers in Italy.

corresponding claims on the East Roman heritage in Central Greece and the Peloponnese. The whole domain of Orthodox Christendom in the Balkan Peninsula might have been parcelled out, before the close of the fourteenth century, into Serb and Albanian barbarian principalities if the barbarians' progress had not been cut short abruptly by the arrival on the scene of the Ottoman founders of an Orthodox Christian universal state, who conquered Macedonia in A.D. 1371-2 and completed their work in this quarter by annexing the Peloponnese in A.D. 1460.

This tardily arrested incursion of the home-grown external proletariat of the Orthodox Christian World into the heart of Orthodox Christendom on the eve of the establishment of the Orthodox Christian universal state has its pendant, as we should expect, in a second offensive movement of the same barbarian forces at the moment when the universal state broke up. In a different context¹ we have detected the rudiments of a barbarian invasion of the Ottoman Empire, on the same Continental European front, at the turn of the eighteenth and nineteenth centuries of the Christian Era, with the same barbarians playing the same parts. In A.D. 1769-79 a band of Albanian mercenaries in the Ottoman service emulated the past exploits of their fellow tribesmen, four hundred years back, by making themselves momentarily masters of the Peloponnese; and in A.D. 1804 the Serbs rose against the Ottoman régime, as they had risen against the East Roman régime *circa* A.D. 1081.

We may also remind ourselves that, in the abortive post-Ottoman interregnum which began in the last quarter of the eighteenth century, the Albanian and Serb upheavals on the Continental European front of the Ottoman Empire were synchronous with other barbarian upheavals on other anti-barbarian fronts for which the 'Osmanlı empire-builders of the sixteenth century had made themselves responsible by their conquests at the expense of the Iranic and the Arabic World.² The 'Osmanlis had thereby acquired a highland frontier in Kurdistan and also two desert frontiers—one on the Syrian and 'Irāqī fringes of the Afrasian Steppe in North Arabia, and another on the Egyptian fringe in Nubia—and, when the Ottoman Empire broke down, these African and Asiatic fronts both likewise lit up. The Kurdish highlanders and the Arabian Nomads began to assert themselves before the close of the eighteenth century, at the same moment

¹ In IV. C (ii) (b) 1, vol. iv, pp. 68 and 69, and IV. C (ii) (b) 2, vol. iv, p. 76, above.

² For the tardy and reluctant expansion of the Ottoman Empire in these two directions see I. C (i) (b), Annex I, vol. i, pp. 384-90, above.

as the Albanians and the Serbs, while the Sudanese Nomads followed suit in A.D. 1883.¹

We have seen that² on all these four anti-barbarian fronts of the Ottoman Empire 'the triumph of Barbarism' was cut short by the far more potent social movement of Westernization. Yet, brief though their career was, these barbarian heroes of an abortive post-Ottoman interregnum did not succumb to their alternative fates of being killed off by modern Western lethal weapons or taking to top-hats, as the price of being given quarter, without leaving behind them some of the characteristic monuments of a barbarian creativity.

In the sphere of religion there was a marked tendency among the barbarians in the hinterland of several of these fronts to adopt the 'higher religion' of the dominant minority of the day in a form that was sufficiently schismatic to be distinctive. In the Orthodox Christian 'Time of Troubles', for instance, the Bosniak section of the Yugoslav external proletariat of Orthodox Christendom did not follow the example of their kinsmen and neighbours the Serbs in accepting the Orthodox Christian Faith. Instead, they took to Bogomilism, a Bulgarian Slav adaptation of a Paulician Adoptionist Christianity which had lingered on among the trans-frontier barbarians beyond the Armenian front of the East Roman Empire, and which had been subsequently carried into the European provinces of the Empire by Paulician deportees.³ Again, under the Ottoman Empire which performed the function of an Orthodox Christian universal state, the 'higher religion' which won its way among the Albanians was not the orthodox Sunnī Islam that was the official religion of the Ottoman dominant minority. The Islam to which the Albanians yielded themselves was the esoterically heterodox school of the Bektāshī Order of Dervishes.⁴ Finally, during the post-Ottoman interregnum, the Najdī Arabs rose up against the Ottoman régime in Asia, and the Kordofānī Arabs against the Egypto-Ottoman régime in Africa, under the impetus of a Wāhhābī and an Idrīsī puritanism⁵ in the

¹ This counterstroke of the Baggara Arab Nomads of Kordofan against the Egyptian Viceroyalty of the Ottoman Empire was both retarded and provoked by a policy of reckless expansion into the heart of Tropical Africa which had been initiated by Mehmed 'Alī when he conquered Sannār and founded Khartum in A.D. 1821, and which had been persisted in by Mehmed 'Alī's successors in the Pashalyq of Egypt until, at the moment of the explosion in A.D. 1883, the Egyptian flag was flying at the sources of the White Nile in the short-lived province of Equatoria. This Egypto-Ottoman advance into the boundless barbarian world of Tropical Africa is comparable to the Khazar advance into the Northern Forest and to the Etruscan advance into the Po Basin. The same rashness drew down upon itself the same nemesis in this case as in those.

⁵ The Idrīsī Sayyids who ruled at Sabyā, on the Asirī section of the Arabian Tihāmah, from the date of their successful defiance of Ottoman authority in A.D. 1910 until the

sight of which the official Sunnī orthodoxy of the contemporary Ottoman 'Westernizers' was no better than outright Infidelity.

In the sphere of literature the Continental European external proletariat of the Orthodox Christian World has transmuted into 'heroic' poetry the experience of its conflict with the Ottoman makers and masters of the Orthodox Christian universal state. The Serb ballads, which have found their principal theme in the Battle of Kosovo, are true to type in concentrating upon a tragic story as a more promising field than any record of worldly success for the exercise of the epic minstrel's art.¹ At the same time the Kosovo Cycle is peculiar, and perhaps unique, among the works of barbarian poetic genius in being inspired by the experience of a frustrated offensive at the climax of a 'Time of Troubles', instead of reflecting the exhilaration of a 'break-through' at the beginning of an interregnum. For the Battle of Kosovo (*commisum* A.D. 1389) was the disaster that shattered the Serbian barbarians' dream of entering into the heritage of a broken-down Orthodox Christian Society which had not yet passed through its universal state.²

It is true that the Serb *guslari* (minstrels) have not left unsung the later chapters in the history of their warriors' struggle against the 'Osmanlis.

'The heroic songs of the historical cycle deal further with the period of subjugation to the Turks, their oppression and individual reprisals carried out by the *hajduci* and *uskoci*, the memory of whom is preserved in the two cycles thus named, both of which contain many beautiful songs. (The *hajduci* were a kind of guerilla warriors who fought the Turks while they kept Serbia subdued; while the *uskoci* were the Jugoslavs who had fled to Dalmatia and the Croatian littoral after the fall of Herzegovina in 1482, where, as mercenaries of the [Hapsburg] Emperors, they defended the borders from the Turks, often raiding and pouncing upon them.)

absorption of their principality into the dominions of the Wahnabi empire-builder 'Abd-al-'Aziz b. Sa'ūd between the years 1926 and 1934, were puritans of the same type as the Sudanese Mahdi Muhammad Ahmad who led the barbarian counter-attack against the Egypto-Ottoman régime in the Upper Nile Basin in A.D. 1881.

¹ For this (no doubt, unconsciously practised) trick of the epic minstrel's trade see further V. C (i) (c) 3, Annex III, p. 610, below.

² The 'Time of Troubles' in the history of the Orthodox Christian Civilization may be said to have run from the last quarter of the tenth century of the Christian Era to the last quarter of the fourteenth; the universal state (i.e. the Ottoman Empire) from the last quarter of the fourteenth century to the last quarter of the eighteenth. The historical events of which some memory is embedded in the Serb 'heroic' poetry of the Classical School—which includes the several cycles of Kosovo, Marko Kraljević, George Branković, Vuk 'the Dragon-Despot', and the Jakšića (see Chadwick, *The Growth of Literature*, vol. ii, pp. 310–25)—fall within the years 1371–1485 (see *ibid.*, pp. 447–8 and 454). There is, however, also a hazy recollection of the great Czar Stjepan Dušan, who reigned in Macedonia from 1331 to 1356, just before the overthrow of the Serbs by the 'Osmanlis' (*ibid.*, pp. 310 and 454). Compare the recollection, in the Teutonic Epic, of the great Ostrogothic war-lord Hermanoric (*Anglicè* Eormenric), who reigned in the Ukraine in the third quarter of the fourth century of the Christian Era, just before the overthrow of the Ostrogoths by the Huns (Chadwick, *The Heroic Age*, pp. 23 and 37).

'The liberation of Montenegro and Serbia at the beginning of the eighteenth and nineteenth centuries respectively has been described in the two cycles thus named The *guslari* [chanted] for the leaders of the First Rising of the Serbs, during the first two decades of the last century. Filip Višnjić, for instance, spent four years in the district of Mačva, and almost all his songs, which he recited for Vuk Karadžić a few years later, describe the fighting between the Serbs and the Turks which took place in that district while he was there, and glorify the deeds of the contemporary Serbian leaders. There are several instances which prove that many Serbian leaders of that period had their own *guslari*, and these very often composed songs in which the heroic deeds of their masters were glorified. This, perhaps, explains the fact that heroic songs which deal with the liberation of the Serbs, and those which chant the achievements of the *hajduci* and *uskoci*, are far more numerous than those dealing with the events and personalities of mediaeval Serbian history'.¹

The quality, however, of this Serbian 'heroic' poetry of a later age is in inverse ratio to its quantity; for the Hajduk and Uskok cycles 'both—and the former especially—relate true historical events with very little poetry. They differ greatly in this respect from the earlier heroic songs. These are, perhaps, the least interesting and the least beautiful'.²

Such as they are, the Hajduk and Uskok cycles of Serb 'heroic' poetry have an Albanian analogue of approximately the same date,³ and also a Greek analogue in songs which celebrate the prowess of *klephts* and *armatoli* who were the Greek contemporaries and counterparts of the Serb *hajduci* and *uskoci* in the interior of the Ottoman Empire.⁴ The Greek Armatole and Klephtic cycles

¹ Subotić, D.: *Yugoslav Popular Ballads: Their Origin and Development* (Cambridge 1932, University Press), pp. 17 and 23-4.

² Ibid., p. 17.

³ See Chadwick, *The Growth of Literature*, vol. ii, pp. 455-6. In its style this Albanian 'heroic' poetry 'seems to resemble Greek "heroic" poetry of the same period, rather than Yugoslav'. In addition to the school of Albanian 'heroic' poetry corresponding in date and in inspiration to the Hajduk and Uskok cycles of Serb 'heroic' poetry, there seems also to be an earlier school, celebrating the exploits of the fifteenth-century Albanian hero Scanderbeg, which would correspond to the Serb Classical School in being a monument of a barbarian experience of the last phase of the Orthodox Christian 'Time of Troubles'.

⁴ Whereas the *hajduci* and *uskoci* were transfrontier barbarians of the Ottoman Empire in the literal and exact meaning of the term, the *klephts* were insurgents whose bases of operations lay within the Ottoman frontiers. It will be seen that, in terms of the history of the Roman Empire, the Serb *hajduci* who crossed the Save and broke into the Serb-inhabited districts of the Empire in A.D. 1804 correspond to the German war-bands which crossed the Rhine and broke into the Roman provinces of Upper and Lower Germany on the last day of A.D. 406, while the contemporary upheaval of the Basque and Isaurian highlanders in the interior of the Roman Empire has its analogue in the upheaval of the Rumiliot and Moreot Greek *klephts*. As for the Rumiliot *armatoli*, these were a local Greek Orthodox Christian hereditary militia which had been tolerated, and indeed encouraged, by the Ottoman Power as an instrument for keeping the *klephts* in check on the principle of setting a thief to catch a thief (κλέπτης is the Greek for thief, while ἀρματολός is a Greek version of the Italian word *armatore*, meaning an outfitter of piratical craft: see Vla'hogiánnis, G.: *Κλέπτες τοῦ Μοριά* (Athens 1935, no imprint of publisher's name), pp. 14 and 17).

of 'heroic' poetry¹ belong to the same school as the Serb Hajduk and Uskok cycles,² and like these, again, they wilted away in the

¹ These Greek cycles confront the student of history with some intricate and obscure preliminary problems of literary analysis and criticism from which the contemporary and corresponding Serb cycles would appear to be free; and those literary difficulties are in their turn due, at any rate in part, to three historical facts. The first of these facts is that the principal seed-bed of this Modern Greek 'heroic' poetry lay, not in the Morea, but in Continental Greece north of the Isthmus of Corinth (a region which, under the Ottoman régime, formed part of the Empire's European metropolitan province of Rumili). The second fact is that before, during, and after the Greek national uprising of 1821 the Rumiliot *klephts* and *armatoli* alike were successfully and permanently crushed by the 'Osmanlis (in 1783 'Ali Pasha of Yannina was appointed by the Porte to be general Derbend Aghasy of Rumili, with the mission of destroying both the *klephts* and the *armatoli* of his province; 'Ali carried out this mission efficiently till his fall in 1820; and the ruin of the martial elements in the Greek population of Rumili was consummated through the ultimate failure in Rumili of the Greek national uprising of 1821 which was ultimately successful in the Morea: see Vlachogiannis, op. cit., pp. 181-2). The third fact is that the life and poetry of the Rumiliot Greek warriors whose history ended in this 'heroic' failure won an immense prestige among their comparatively feeble and inglorious Moreot 'opposite numbers' who scored, contemporaneously, the solid worldly success of liberating their peninsula from Ottoman rule and making of it the nucleus of a 'successor-state' of the Ottoman Empire in the shape of a Greek national state on the contemporary Western pattern (see p. 299, below). If the institution of *armatoli* had ever existed in the Morea, it had been destroyed in the turmoil of the Venetian intrusion (*durabat* A.D. 1684-1715: see IV. C (iii) (c) 2 (α), vol. iv, pp. 279-80, above, and V. C (i) (d) 6 (γ), Annex I, in the present volume, pp. 637-8, below); upon the Ottoman reconquest the duties performed by the Greek *armatoli* in Rumili were assigned in the Morea by the reinstated Ottoman authorities to an alien Albanian militia (Vlachogiannis, op. cit., pp. 13-25) which continued to perform these duties here throughout the restoration period (*durabat* A.D. 1715-1821); the only *ra'iyeh* in the Morea who were authorized to bear arms during this period were the tame apparitors (called *Kάπροι*) of the local Orthodox Christian civilian notables (the *khōja-bāshis*); and the Moreot *klephts* (see *ibid.*, pp. 34-74 and 110-35), who ventured to raise their heads only between 1770 and 1806, and who were never more than 150 strong all told (*ibid.*, pp. 88, 159, 176), were more of a plague to their own co-religionists than they were to the local representatives of the Ottoman 'Ascendancy' (*ibid.*, pp. 37, 155, 160-2, 180-1), and were eventually hunted down or forced to fly the country by a general hue and cry in which law-abiding Christian and Muslim Moreots joined with equal alacrity, and which attained its objective within a few weeks (*ibid.*, pp. 136-82). These inglorious antecedents stung those survivors of the Moreot *klephts* and *kapi* who distinguished themselves in the War of 1821-9 into attempting to ennoble themselves by claiming a fictitious 'Moreot *armatole*' ancestry; and to this end they seem to have gone to prodigious lengths in forging for themselves a 'heroic' history and literature on Rumiliot models (*ibid.*, pp. 11 and 257). These two kinds of Moreot fake are exemplified respectively in the Kolokotronaic family cycle of spurious 'heroic' ballads (see p. 299, footnote 3, below) and in the memoirs of the most illustrious member of this house, Theodore Kolokotronis, which he dictated in his old age under the title of *Διήγησις Συμβάντων τῆς Ἑλληνικῆς Φυλῆς, 1770-1836* (Athens 1889, Estia, 2 vols.). In this work, on p. 40 of that edition, there is a romantic sketch of the life of the (in truth sordid) Moreot *klephts* and the (in truth non-existent) Moreot *armatoli* which has been devastatingly exposed, for the fancy picture that it is, by Vlachogiannis in op. cit., pp. 42-3. The critic shows that Kolokotronis has purloined his fictitious Moreot colours and outlines from the true portrait of the Rumiliot *armatoli* whose acquaintance he first made as their fellow refugee in Zante in and after 1806. Some of the details of Kolokotronis' sketch appear to have been taken (Vlachogiannis, op. cit., pp. 42-3) from a still unpublished account by an eye-witness of the life of the Rumiliot *armatoli* in the Aspropótamo district during the years 1821-4. It will be seen that the authentic life and literature of the full-blooded Rumiliot *armatoli* and *klephts* are exceedingly difficult to reconstruct.

² The literary affinity here is indeed so close that a Western scholar is said to have discovered the existence of the Modern Greek 'heroic' poetry by inference from his knowledge of the existence of the Serb 'heroic' poetry, as an astronomer sometimes suspects the existence of a hitherto undetected star by inference from his observations of the movements of other heavenly bodies. According to an anonymous article in the *Athena* of the 8th November, 1858 (quoted in Vlachogiannis, op. cit., pp. 198-9), a German scholar from the Rhineland, who was brought to Vienna in 1814 by business relating to the international peace congress that was being held in that city in that year,

hour in which the historic deeds that were the minstrels' theme were crowned with success. How are we to explain this apparently premature drying up of the springs of a barbarian poetic inspiration? Was it the very success of the 'heroes' in real life that debarred their fictitious doubles, who were being conjured into a poetic existence in the minstrels' imagination, from entering upon a career in that 'other world' of literary life in which the Siegfrieds and the Guthheres have grown to so vastly taller a stature than was ever attained by the petty war-lords whose historic names are borne by these famous creatures of imagination?¹ No doubt the Karageorgević or the Obrenović who had laid aside his weapons and stepped out of his forest fastness in order to receive an Imperial patent from a discomfited Pādishāh and then take his seat, as a duly recognized princeling, upon a tawdry little throne, had thereby made himself as poor a subject for 'heroic' poetry as Theodoric when he stepped into Odovacer's shoes in the guise of the Emperor Anastasius's viceroy in Italy, or as Clovis when he accepted the insignia of the consulship from the same Emperor's envoys after his victory over the Visigoths at Vouillé.² On this analogy³ we may surmise that the 'heroic' poetry of the Serb and Greek external proletariat of the Ottoman Empire would in any event have had a short life after the successful establishment of a Serb 'successor-state' of the Empire in the Morava Basin and a Greek 'successor-state' in the Peloponnese. We have noticed, however,⁴ that these barbarian 'successor-states'

suggested to the Director of the Imperial Library in Vienna, Kopitar, who had published a collection of Serb folk-songs, that an inquiry might reveal the existence of a corresponding school of poetry among the Greeks. Kopitar passed on this suggestion to a member of the Greek colony in Vienna, and eventually the Greek colonies in Vienna and Paris, between them, duly collected a number of Greek folk-songs (most of which appear to have been supplied by a Viennese Greek's grandmother, who was living in her grandson's household) and placed their collection in the hands of a French scholar who had made his mark in this field by publishing a collection of French folk-songs. This was the origin of C. Fauriel's *Chants Populaires de la Grèce Moderne* (Paris 1824-5, Firmin-Didot, 2 vols.).

¹ On this point see further V. C (i) (c) 3, Annex III, pp. 612-13, below.

² On this point see further V. C (i) (c) 3, Annex III, pp. 613-14, below.

³ A worldly success which might put its winner out of the running for becoming the popular hero of a genuine 'heroic' poetry might, of course, at the same time place it within the barbarian *arriviste's* power to make good the lack of genuine poetry in his honour by procuring the fabrication of fakes. According to Vlachogiannis, op. cit., pp. 215-25, the Greek ballads of which the Kolokotronatoi, individually or collectively, are the heroes, are none of them genuine, but are the offspring of a series of literary forgeries perpetrated by, or on behalf of, the family in the course of the half-century beginning in 1821. According to the same scholar again (op. cit., *passim*), this faking of the Kolokotronaic cycle of Modern Greek 'heroic' ballads is merely the classical example of a contemporary orgy of fabrication for which the motives were the glorification of particular individuals, families, and districts. Any student of history who wishes to arrive at an independent opinion of his own on the subject of Monsieur Vlachogiannis' iconoclastic thesis will find a collection of the Kolokotronaic ballads at the end of the second volume of Theodore Kolokotronis' memoirs in the edition cited above on p. 298, footnote 1. Three are printed in Politis, N. G.: *Ἐκλογὰ ἀπὸ τὰ Τραγούδια τοῦ Ἑλληνικοῦ Λαοῦ* (Athens 1914, Estla), Nos. 53, 60, 64.

⁴ In IV. C (ii) (b) 2, vol. iv, pp. 76-8, above.

of the Ottoman Empire had hardly begun to take shape before they underwent a transformation into the totally different species of states members of the Western comity. And it seems probable that their 'Westernization' was a still more potent factor than their material success in killing the Serb and Greek 'heroic' tradition.

The revolutionary change of social environment which was brought about, within the span of a single lifetime, by the inrush of Western technique and ideas and institutions that accompanied the Greek insurrection against the 'Osmanlis is vividly depicted in the words of a *ci-devant* Peloponnesian *klepht* who had made his name and fortune as a warrior-patriot in the Greek national 'uprising' (*epanastasis*) of A.D. 1821-9. The passage occurs in the memoirs of Theodore Kolokotrónis which were dictated to an amanuensis by this illiterate leader of a barbarian war-band in his old age, when, after having fought and quarrelled and pillaged his way through the Greek War of Independence, he was living, like a shark out of water, under the sovereignty of a king who had been imported from Bavaria in order to guide the feet of the victorious *klephts* into the way of Western Civilization.¹

'In the days when I was young and might have learnt something, schools and academies didn't exist. There were only just a few schools in which they learnt to read and write. The old-time *khōja-bāshis*, who were the leading men of a place, hardly knew how to write their own names. The majority of the archpriests knew nothing but what they had picked up of the ecclesiastical routine; not one of them had had a real education. The Psalter, the Eightfold Chant, the Book of Monthly Offices and other prophetic works were the books that I read. It was not till I went to Zante² that I found the History

¹ King Otto's task was no sinecure. The exotic throne on to which he had mounted with youthful optimism in A.D. 1833 was shaken by a revolution in 1843 and was finally pulled away from under him in 1863. And the Danish dynasty which has since tried its hand in Greece has fared almost as ill as its Bavarian predecessor. In 1938 it was not yet possible to guess what was to be the ultimate sequel to the arbitrary restoration of a monarchical régime in Greece by a military *coup d'état* which had been announced on the day—the 11th October, 1935—on which these lines were being written in the first draft of the present Part of this Study.

² The Ionian Islands, of which Zante was one, had been incorporated into the Western World since their seizure from the East Roman Empire by a Norman admiral and a Genoese pirate towards the close of the twelfth century of the Christian Era. They had eventually all been acquired by Venice, and they remained in Venetian hands until Napoleon took them as part of the French share of the spoils when he partitioned the Venetian dominions with the Danubian Hapsburg Monarchy in A.D. 1797. The Islands were then taken from the French by a Russian expeditionary force, which was in occupation in 1806 when Kolokotrónis sought refuge in Zante after having been hunted out of his native Morea as one among some 150 Moreot *klephts* who were suppressed, as a public nuisance, in the first quarter of 1806, by the law-abiding majority of their local compatriots and co-religionists under Ottoman leadership (Vlakhogiánnis, *op. cit.*, pp. 142-65). In 1807 the Russians retroceded the islands to the French; but all of them except Corfu were promptly wrested out of French hands by the British. Kolokotrónis enlisted in a Greek force which the British Government raised in the islands, and he remained in the British service until two years after the close of the Napoleonic Wars: that is,

of Greece in plain Greek. The books that I read often were the History of Greece, the History of Aristomenes and Gorgo, and the History of Scanderbeg. In my opinion it was the French Revolution and Napoleon that opened the eyes of the World. Before that, the nations were not heard of; the kings were treated like gods on Earth; and whatever those kings did was praised as a matter of course. On this account, by the way, it is more difficult to govern people nowadays. In my time, trade was very small; money was scarce; the dollar fetched three gurush; and anybody who had a thousand gurush was "a big noise": with that amount one could do business which one couldn't do now with a thousand of Venetian currency. There was little intercourse; it was only our Revolution that brought all the Greeks together. You could find people who didn't know the next village an hour's walk from their own. Zante seemed as far away then as the ends of the Earth seem now. What America is to us now—that is pretty well what Zante was to them. When they went to Zante, they called it "going to the Western World" (*ἔλεγον εἰς τὴν Φραγκίαν*).¹

The headlong onset of 'Westernization' that is sketched in this passage will convincingly account for the galloping consumption which overtook both the Greek and the Serb school of 'heroic' poetry in the nineteenth century in a doubly deleterious atmosphere of sophistication and commercialization. In Greece 'the ballads of 1821 were not given time to attain their final form, because the prosaic political and social life which descended upon them brought their [natural] evolution to a halt'.² In Bosnia, Herzegovina, and Montenegro the life, and with it the minstrelsy, of 'the Heroic Age' survived until the Austro-Hungarian occupation of the two former provinces in and after A.D. 1878;³ and even in the sooner westernized Kingdom of Serbia new 'heroic' poems are credibly reported to have been composed to celebrate incidents in the wars of 1912-18.⁴ Yet there is also a record of a man being approached, in Montenegro, as far back as 1876 with the 'business proposition' that 'he could have his name brought into

till about four years before the outbreak of the Greek War of Independence in 1821 gave him his opportunity to return, in the *beau rôle* of a patriot, to a native land from which he had been evicted as a malefactor fifteen years earlier.—A.J.T.

¹ Kolokotrónis, *op. cit.*, vol. i, pp. 48-9. The foregoing first-hand account of how the *ra'iyeh* lived 'in real life' in the last days of the Ottoman Empire is oddly reminiscent of the archaistic Utopia which is sketched as an ideal in the *Tao-te King* (see the passage quoted in V. C (i) (d) 8 (α), vol. vi, p. 59, below). The Moreots' feeling in the years before 1821, to which Kolokotrónis here testifies, that Zante was an *alter orbis* must have been borne in upon the writer by an incident which he himself records at an earlier point (p. 18). In 1805, when the Moreot *klephts* had made their own country too hot to hold them, Kolokotrónis went on a personal reconnaissance to Zante and then came back home with the intention of recruiting some of his Moreot fellow malefactors for mercenary service in the neighbouring island. Though they all knew that on their native heath their days were numbered, Kolokotrónis' comrades rejected his proposal, replying to him with one accord: 'We will not go to Phrangiá; we want to die in our native land.'

² Vlachogiánnis, *op. cit.*, p. 266.

³ Chadwick, *The Growth of Literature*, vol. ii, pp. 337 and 434

⁴ *Ibid.*, p. 337.

a poem—presumably as a hero—on payment of two plete, i.e. forty kreuzer or about eightpence'.¹ After the turn of the century 'oral tradition among the Orthodox Christians had largely been displaced by printed books of poems, owing to the enterprise of a printer in Nikšić. In the Montenegrin army there was a regular organization of minstrels under a *kapetan od guslara* or "chief of the minstrels". These men composed their poems collectively and sent them to the printer, who in his turn, apparently after some revision, supplied them with printed copies.'²

By the year 1936 the two English students of the subject who have just been quoted found on inquiry

'that nearly every one [in the Serb-speaking parts of Yugoslavia] now can read, and that printed collections of poems are purchasable everywhere, not to mention gramophone records and wireless performances. Moreover, even the most remote districts are no longer inaccessible to external influence'.³

This explanation of the decay of the Serb and Greek schools of 'heroic' poetry is borne out by the fact that the Russian school, which took no harm from the 'Byzantinization' of Kiev in and after the reign of Vladímir (*regnabat* A.D. 980–1015), has proved unable to survive the Westernization of Muscovy in and after the reign of Peter the Great (*imperabat* A.D. 1682–1725).

'The intellectual outlook of the Russian minstrels has hardly kept pace with the growing dignity of their subjects. This increasing disparity becomes most obvious when we come to the last large body of narrative heroic poetry which Great Russia has produced—that on the Napoleonic Wars. In the Tsar Alexander, as in his enemy Napoleon, the poets had subjects which might well have inspired a new school of heroic poetry. Tolstoy's *War and Peace* reflects the consciousness which was felt by all Russians, whether in the officers' quarters or in the Moscow and Petrograd drawing rooms, that they were living in an age of heroes. Yet when we read the *byliny* [heroic poems] on the capture of Smolensk, and observe the part assigned to the Cossack General Platov and to the Tsar himself, we are conscious of a paradox. The function of heroic poets is to glorify human action and exalt human beings; but in the pictures of Platov at the French court, of the Tsar Alexander cutting his beard or receiving the intimation of Napoleon's approach, the poet has unconsciously reduced his heroes far below their actual human dignity. The epic manner and formulae are still preserved, but the exaltation has vanished, the epic figures have become puny. Above all, the presentation of the facts is distorted and unworthy of the great events and changes which were taking place. The breach between the minstrels and their old patrons, which shows itself in the poverty of the treatment of exalted subjects, has become

¹ Chadwick, op. cit., vol. ii, p. 439, following M. Murko.

² Ibid.

³ Ibid., p. 434.

final—a breach which was perhaps first foreshadowed when the travels of Peter the Great in search of enlightenment¹ were described by an indulgent but uncomprehending minstrel as “amusing himself abroad”.²

When the rulers of Muscovy ‘went Western’, they were betaking themselves beyond the range of the Russian minstrel’s capacity for imaginative comprehension; and in these circumstances it was so much the worse for the Russian tradition of ‘heroic’ poetry that these changelings thenceforth monopolized the field of action that was fit to become a ‘heroic’ theme. Unable to treat of high matters that passed his understanding, the minstrel was reduced to harping upon prosaic trivialities. Deprived of the grain that was its due, the Russian epic genius quickly died of inanition on a starvation-diet of chaff.

The Hindu External Proletariat.

When we pass from the main body of Orthodox Christendom—with its alien Varangian and Norman and Saljūq barbarian incursions at the beginning of its Romano-Bulgarian ‘Time of Troubles’ and with the abortive ‘heroic age’ of its home-bred Albanian and Serb and Greek barbarians at the dissolution of its Ottoman universal state—we shall find some of the same features reappearing in the history of the relations between the external proletariat and the dominant minority of the Hindu World.

In Hindu history the earliest of the barbarian offensives that accompanied the Hindu ‘Time of Troubles’ (*saevebat circa* A.D. 1175–1575)³ was likewise delivered by invaders from the back of beyond who had been ‘passed on’ by a neighbour civilization. The Turkish war-bands whom Sebukteġin of Ghaznah and his son and successor Mahmūd led down from Zābulistān upon the Panjab at the turn of the tenth and eleventh centuries of the Christian Era⁴ were the kinsmen as well as the contemporaries of the Saljūqs who trespassed out of Transcaspia into Iran in A.D. 1026 and who were ‘passed on’ into the Anatolian territories of Orthodox Christendom in A.D. 1037.⁵ But, just as, in the Orthodox

¹ For an estimate of the true significance of Peter’s Western tour in A.D. 1697–8 see III. C (ii) (b), vol. iii, pp. 281–3, above.—A.J.T.

² Chadwick, N. K.: *Russian Heroic Poetry* (Cambridge 1932, University Press), p. 23. Compare Chadwick, H. M. and N. K.: *The Growth of Literature*, vol. ii (Cambridge 1936, University Press), pp. 91–2.

³ See IV. C (iii) (b) 2, vol. iv, p. 99, above.

⁴ See IV. C (ii) (b) 2, vol. iv, pp. 98 and 100, above.

⁵ This cleavage in the host of Nomad invaders of South-Western Asia, at the turn of the tenth and eleventh centuries of the Christian Era, into a right wing which swept on into Anatolia and Syria and Egypt and a left wing which swerved away over the Hindu Kush into India has its analogue in the cleavage between the Hyksos conquerors of Egypt and the Aryan conquerors of India in the second millennium B.C. This analogy has been pointed out in another connexion in I. C (i) (b), vol. i, pp. 104–7, above.

Christian 'Time of Troubles', the barbarians from the back of beyond—Varangians and Saljūqs and Normans—were followed, in their invasion, by the home-grown Serbs and Albanians, so in the Hindu 'Time of Troubles' the Turkish Nomad invaders from the Eurasian Steppe were followed by other barbarians whose native haunts were nearer at hand, on the south-eastern rim of the Iranian Plateau.¹ The great 'break-through', which carried the barbarian invaders, at one swoop, from the line of the Sutlej to the coast of Bengal, was achieved by the Ghūrīs—an Iranian mountain-people from the highlands between Ghaznah and Herāt and Qandahār² who had previously supplanted the Ghaznawīs both in Zābulistān and in the Panjab. And, although the Eurasian Nomads came to the front again in the war-bands of the 'Slave-Kings' and the Taghlāqīs who ruled over Hindustan in the thirteenth and fourteenth centuries,³ their successors the Lōdī Afghans, whose reign coincided in time with the last and worst phase of the Hindu 'Time of Troubles',⁴ were highland barbarians of the same breed as the Ghūrīs, from the threshold of the Hindu World beyond the North-West Frontier.

This Hindu 'Time of Troubles', in which the Turkish Nomads and the East-Iranian highlanders had thus taken turn and turn about in serving as 'the scourge of God', was brought to an end by the establishment of a Mughal Rāj which gave the Hindu Society its universal state;⁵ and in the subsequent chapters of Hindu history the home-grown East Iranian external proletariat of the Hindu World has had the field to itself; for since the reign of Akbar (*imperabat* A.D. 1556–1602), who was the true author of the *Pax Mogulica*,⁶ the Eurasian Nomads have not again appeared above the Hindu horizon. When the *Pax Mogulica* prematurely dissolved in the eighteenth century, the barbarians who rushed in—to contend for the possession of the carcase with the Marāthā protagonists of a militant Hindu reaction against an alien universal state—were the East Iranian Rohillas and Afghans; and, when Akbar's work was reperformed by other alien hands, and the Hindu universal state was re-established in the shape of a British in place of a Mughal Rāj, the defence of the North-West Frontier, over against the wild highlanders of North-Eastern Iran, proved to be by far the heaviest of all the frontier-commitments that the

¹ We may also bring into the comparison the descent of the Hittites and the Kassites upon the Land of Shinar, after the passage of the Hyksos, during the post-Sumeric interregnum; and the descent of the Medes upon Assyria, after the passage of the Cimmerians and the Scyths, during the Babylonian 'Time of Troubles'.

British empire-builders in India had to take over from the vanquished rival candidates for the succession to the Mughal heritage.¹

By the year 1938 the gravity of this British commitment could be estimated in the light of a mature experience; for by then more than a hundred years had passed since the British masters of India had first addressed themselves to the task of finding a solution for the North-West Frontier problem; and, so far, none of the alternative possibilities had proved, on trial, to be altogether satisfactory.

The first alternative which the British empire-builders tried was to conquer and annex outright the whole of the East Iranian barbarian threshold of the Hindu World right up to the line along which the Mughal Rāj, at its apogee, had marched with its own Uzbek 'successor-states' in the Oxus-Jaxartes Basin and with the Safawī Empire in Western Iran. The adventurous reconnaissances which were carried out, from A.D. 1831 onwards, by Alexander Burnes,² were followed up by the still more hazardous step of dispatching a British-Indian military force to Afghanistan in 1838; but this ambitious attempt at a 'totalitarian' solution of the North-West Frontier problem had a disastrous ending. For, in the first flush of their triumphantly successful conquest of all India, south-east of the Indus Basin, between 1799 and 1818,³ the British empire-builders had over-estimated their own strength and under-estimated the vigour and effectiveness of the resistance that their aggression would provoke among the untamed barbarians whom they were proposing now to subdue.

At a time when the Panjab was still in the hands of the fully sovereign and formidably martial Power of the Sikhs, while the amīrs of Sind were bitterly hostile to British designs which they could not resist by force, Afghanistan was really beyond the effective reach of a British Rāj whose military operations in the East Iranian highlands had to be conducted from such distant bases as Calcutta and Bombay; and, if the military omnipotence of the British at this time in the Indian territories east of the Indus and south of the Sutlej thus gave no measure of British military strength

¹ Compare the heaviness of the frontier-commitment on the Continental European border of the Hellenic World which the Romans had to take over from the Etruscans and Tarentines and Macedonians (see II. D (v), vol. ii, pp. 161-4, and the present chapter and volume, pp. 215-16, above, and V. C (i) (c) 3, Annex I, pp. 591-5, below).

² Burnes, A.: *Travels into Bokhara; being the account of a journey from India to Cabool, Tartary and Persia; also, narrative of a voyage on the Indus, from the Sea to Lahore, with presents from the King of Great Britain; performed under the orders of the Supreme Government of India, in the years 1831, 1832 and 1833* (London 1834, John Murray, 3 vols.); idem: *Cabool: A personal narrative of a journey to, and residence in, that city, in the years 1836, 1837 and 1838*, 2nd edition (London 1843, John Murray).

³ Before 1799 the British Rāj was in effect confined to Bengal. Bombay, Madras, and the Circars were mere enclaves in non-British territory, and had no communications with Bengal except by sea.

at Ghaznah or Kābul, conversely the perpetual political dissensions and civil wars in which the barbarians of Afghanistan were consuming their energies gave no measure of their ability to make common cause against an alien invader who threatened to deprive them all alike of their unanimously cherished privilege of living in a state of anarchy. Times had changed in the East Iranian highlands since the seventeenth century of the Christian Era, when the Mughal and Safawī and Uzbeg Powers had contended with one another for command of the frontier-fortresses of Qandahār and Herāt and Balkh while the highlanders remained sullenly submissive or passively aloof. In the eighteenth century, when the Mughal and Safawī Empires had broken up, while the Uzbeg Khanates were sinking into an ever deeper decay, the highlanders had been having their fling. They had usurped the throne of Shāh 'Abbās from 1722 to 1730,¹ and had raided the plains of Hindustan from 1745 to 1761;² and, although their licence had been curbed before the eighteenth century had run out, and they had ebbed back into the mountains from which they had descended, the memory of their eighteenth-century marauding adventures still inspired them, in the nineteenth century, with a self-conceit and self-confidence that made them rise in vehement revolt against a British effort to reduce them to submission in their native fastnesses. For these various reasons the British attempt to solve the Indian North-West Frontier problem by conquering the entire barbarian hinterland ended, in 1841-2, in a disaster of greater magnitude than the Italian disaster in the Abyssinian highlands in 1896.

After this first resounding failure the second chapter in the history of the British attempt to cope with the North-West Frontier opened in 1849, when the annexation to the British Rāj of Sind in 1843, and of the Sikh principality in the Panjab in consequence of the Anglo-Sikh wars of 1845-9, had carried the north-western boundary of British India forward, along the whole front, to the south-eastern foot of the escarpment of the Iranian Plateau.³ Since 1849 the British Rāj has always possessed the geographico-strategical facilities, which it so conspicuously

¹ See Browne, E. G.: *A Literary History of Persia*, vol. iv (Cambridge 1928, University Press), pp. 122-33.

² By 1745 the power of the Rohilla Afghan military adventurers in the country on the left bank of the Upper Ganges, on which they have stamped the name Rohilkund, had been already established by their first leader 'Alī Muhammad Khān. The invasions of Hindustan by the Abdālī or Durrānī Afghan military adventurer Ahmad Shāh began in 1747 and culminated in his victory over the Marāthās at Panīpat in January 1761.

³ The earliest British attempt to organize and pacify the piedmont frontier of the Panjab is graphically described at first hand in Edwardes, H. B.: *A Year on the Punjab frontier in 1848-49* (London 1851, Bentley, 2 vols.). The author was serving in the name of a Panjābī Sikh Rāj which had already been taken under tutelage by the British Rāj but had not yet been formally superseded by it.

lacked in 1838, for applying the original policy of conquest to the untamed barbarians in the East Iranian highlands; but, though there have been two more Anglo-Afghan wars since then—one in 1879–81 and another in 1919—the British ambition to make a permanent conquest of the highlands has not ever, in fact, been more than tentatively revived, and the variations in British frontier policy since 1849 have been tactical rather than strategic, since they have all alike been subject to the unvarying fundamental postulate that—whatever the line along which the frontier was to run, and whatever the military and political expedients by which it was to be maintained—there was now to be no question of eliminating by force of arms the untamed barbarian war-bands beyond the pale.

Within the limits allowed by this postulate there have, of course, been considerable variations in method—some local and some temporary.¹ In the south-western section of the frontier the effective military and political front has been established on the summit of the plateau, on the farther side of the wall of mountains by which the plateau is surrounded. In the north-eastern section the front has been kept below the foot of the mountains, part way between the water-shed of the Indus Basin and the channel of the river Indus itself; and on this sector there have been alternations between a tendency to move the limit of effective occupation forward, towards the juridical frontier between India and Afghanistan,² and a tendency to leave unadministered as broad a zone as possible of the barbarian territory that is juridically subject to the Government of India's sovereign authority. In the counsels of the British Indian military and political authorities the 'forward' and the 'close border' frontier policies have alternately prevailed, and then each time each in turn lost credit, as the particular drawbacks and inconveniences of each have once again been exposed under the test of a practical trial. And this history of British Indian frontier policy bears out a social 'law'—which we have mentioned, by anticipation, at the beginning of this chapter, and which we shall seek to demonstrate in a later part³—to the effect that, on a stationary frontier between Civilization and Barbarism, Time does not tell in Civilization's favour. The cogeny of this 'law' was being brought home by

¹ See de Watteville, H.: *Waziristan, 1919-1920* (London 1925, Constable), pp. 6-14 and 28-45.

² This juridical frontier—the so-called 'Durand Line'—was laid down in 1893, by agreement between the British Indian and Afghan Governments, from a point abutting on the Persian frontier in Seistan to a point at the head of the Kurram Valley. Towards its north-eastern extremity this line traversed barbarian territory which, except at a few points, had not yet, by the year 1938, been brought under the effective authority of either of the two contracting parties (see Toynbee, A. J.: *Survey of International Affairs, 1925*, vol. 1 (London 1927, Milford), p. 549).

³ In Part VIII, below.

current events at the time of writing of the first draft of this chapter in the autumn of the year 1935, when the Government of India was finding itself once again constrained to undertake elaborate military operations against one of the barbarian war-bands¹ in the non-administered zone of the North-West Frontier Province.

The External Proletariat of the Main Body of the Far Eastern Society.

When we pass from the Hindu World to the main body of the Far Eastern Society, the spectacle that meets our eyes there is the same *mutatis mutandis*. The Far Eastern 'Time of Troubles' (*saeviebat circa* A.D. 875-1275), which set in with the decline and fall of the T'ang Dynasty, was punctuated by a series of barbarian encroachments upon the Far Eastern Civilization's domain in which the Eurasian Nomads opened the first breach and were afterwards followed up by home-grown highlander barbarians from the threshold of the invaded society's territory.² The Khitan Nomads, who *circa* A.D. 550³ had appeared on the horizon of a nascent Far Eastern World at the extremity of the Eurasian Steppe between Korea and the Khingan Mountains, gained a footing south of the easternmost section of the Great Wall *circa* A.D. 927-37.⁴ Some two hundred years later these Nomadic Khitan were supplanted, and their encroachments at the Far Eastern Society's expense were extended, by the Kin barbarians⁵ from the forest-clad highlands between the Manchurian Steppe and Korea (as, in the Hindu World, the Ghūrīs supplanted and out-ranged the Ghaznawī Turks,⁶ and, in the Syriac World, the Muwahhid highlanders from the Atlas followed at the heels of the Murābit Nomads from the Sahara⁷). In the thirteenth century of the Christian Era the Kin, in their turn, were supplanted by the Khitan's fellow Nomads the Mongols, who completed the barbarian conquest of the main body of the Far Eastern World and thereby provided it with a universal state (as the Mughals performed a corresponding service for the Hindu World and the

¹ The Upper Mohmands.

² A brilliant and penetrating study of the continental anti-barbarian frontiers of the main body of the Far Eastern World will be found in Lattimore, O.: *Manchuria Cradle of Conflict* (New York 1932, Macmillan). The author has made his observations at first hand; and, both on this account and because of his powers of analysis and generalization, his work throws a flood of light not only on the particular field with which he is concerned but also on the whole subject of anti-barbarian frontiers. The technical term 'reservoir', which Mr. Lattimore has coined for his own use in his book, refers to the same geographico-social phenomenon as the term 'threshold' or *limen*, in the sense in which that is used in this Study (see the present chapter, pp. 208-10, above).

³ See the present chapter, p. 274, above.

⁴ See II. D (v), vol. ii, p. 121, and IV. C (ii) (b) 2, vol. iv, p. 86, above, and V. C (ii) (b), vol. vi, p. 307, below.

'Osmanlis for the main body of Orthodox Christendom). Thereafter, when the Mongols had been driven out again to their own side of the Great Wall by the Chinese militant nationalist reaction that was led by the Ming,¹ the Nomadic Mongols' work of establishing a Far Eastern universal state was eventually reperformed by the Kin's fellow highlanders the Manchus.²

Upon all these barbarian invaders of the Far Eastern World, whether Nomads or highlanders, the influence of the culture of the conquered society has worked so swiftly and penetrated so deep that they have had little need, or opportunity, to exercise any creative faculties of their own. The Manchus, in particular, have shown themselves whole-hearted converts to a Far Eastern Civilization which they had been imbibing from the long-established Chinese settlers in South Manchuria before ever they committed their own trespass across the Liaotung Pale and on beyond, through Shanhaikwan. Of all the four successive hosts of intruders—Khitan and Kin, Mongols and Manchus—the Mongols alone have offered a conscious and obstinate resistance to the process of Sinification. The Mongols' native Nomadism, which was the first barrier that divided them from the peasants and litterati of the Far Eastern World, was reinforced, before their intrusion upon Far Eastern ground, by the tincture of Syriac culture which the Nestorian missionaries on the Eurasian Steppe had imparted to the Karāyits and the Naimans.³ And the Mongols thus brought with them into China a distinctive culture of their own. Thereafter their determination to retain their separate social identity was displayed in their attitude towards the Mahāyāna, with which their conquest of China brought them into contact. In spite of the attraction which this 'higher religion' exercised upon these primitive pagans, the Mongols did not embrace the Catholic Mahāyāna which had become the universal church of the Far Eastern World.⁴ They turned, in preference, to the Tantric form of Mahayanian Buddhism which had been begotten in Bengal and had found a second home in Tibet.⁵ Qubilai Khan (*imperabat* A.D. 1259-94) himself showed favour to, and interest in, the Tibetan Lamas; and three hundred years after his time, and two

¹ See II. D (v), vol. ii, pp. 121-2; IV. C (ii) (b) 2, vol. iv, p. 87; Part V. A, in the present volume, p. 3; and V. C (i) (c) 1, p. 54, above; and V. C (i) (c) 4, p. 351; V. C (ii) (a), vol. vi, p. 193; and V. C (ii) (b), vol. vi, p. 305, below.

⁴ For the conquest of the Far East by the Catholic Mahāyāna during the post-Sinic interregnum see V. C (i) (c) 2, pp. 139-46, above.

⁵ For this Tantric or Lamaistic form of the Mahāyāna see I. B (iii), vol. i, p. 35; I. C (i) (b), vol. i, pp. 90-2; II. D (vi), Annex, vol. ii, p. 405, footnote 1; and V. C (i) (c) 2, in the present volume, p. 137, above.

hundred years after the expulsion of his successors from China to the Nomads' own side of the Great Wall, the Mongols at length adopted this Tantric Buddhism *en masse* in A.D. 1576-7.¹ The adoption of a distinctive religion is, as we have observed,² one of two characteristic manifestations of originality in the souls of barbarians who feel moved to retain and express their own barbarian *êthos* instead of succumbing to the faded charms of the moribund civilization at whose expense they are running amok. The second characteristic form of barbarian self-expression is the creation of a 'heroic' poetry;³ and inquiry reveals that the recalcitrant Mongol barbarian 'borderers' on the Eurasian frontier of the main body of the Far Eastern World have expressed themselves in this way as well. Among the Mongol Nomads whose ranges lay within the boundaries of Manchuria, there could be heard sung, in 1935,⁴ ballads celebrating the exploits of Mongol bandits in the *ci-devant* Imperial Pastures of the Manchu Crown which had been turned, in 1902, into an ordinary administrative district (*hsien*) of the Chinese Republic, where the Mongols' Nomadism would be challenged thenceforth by the advance of the Chinese peasant-colonist's plough.

The Iranic External Proletariat.

In the history of the Iranic World the breakdown of the Iranic Civilization—which we have equated with the schism in the Iranic body social in the generation of Shāh Ismā'il⁵—was accompanied by the Uzbek barbarian Nomads' occupation of the Oxus-Jaxartes Basin.⁶ This Nomad encroachment, which corresponds to the Khitan's intrusion upon the Far Eastern World after the fall of the T'ang, was never carried farther; for, at the Khurasanian escarpment of the Iranian Plateau, the Uzbeks were brought to a halt by the Safawis, as the White Huns had been arrested at the same line by the Sasanids and the Sakas by the Arsacids.⁷ Yet, for nearly four hundred years after the Uzbek occupation of the Oxus-Jaxartes Basin, the Persians had to put up with the perpetual raids of the Uzbeks' Türkmen protégés in Transcaspia;⁸ and in

⁷ See II. D (v), vol. ii, p. 141, footnote 2; Part III. A, Annex II, vol. iii, p. 449; and the present chapter and volume, pp. 239-40, above, and V. C (i) (c) 3, Annex II, pp. 601-2, below. It may be noticed that the Uzbeks, when they were prevented from advancing into South-Western Asia, contented themselves with their conquests in the Oxus-Jaxartes Basin like their sixth-century Turkish predecessors, and did not seek an alternative field for further expansion in India, like the White Huns and the Sakas.

⁸ For the eventual subjugation of these Türkmen by the Russians in A.D. 1873-86 see the present chapter, p. 323, footnote 3, below.

the first quarter of the eighteenth century of the Christian Era, when the Iranic 'Time of Troubles' was overtaken by its next paroxysm, the Afghan highlander barbarians from North-Eastern Iran also momentarily overran the derelict territories of a decrepit Safawī Empire (as we have noticed incidentally in our foregoing survey of the external proletariat of the Hindu World).¹

The Russian External Proletariat.

In the offshoot of Orthodox Christendom in Russia the 'Time of Troubles'² set in, after an exotic bloom that had lasted for less than a hundred years from the date of Vladímir's conversion, upon the decay of the authority of the principality of Kiev towards the end of the eleventh century of the Christian Era.³ And, in Russian history too, this first stage in the disintegration of a civilization was signalized by the scourge of Nomad barbarian assaults. The Russians, however, were more successful than the Hindus or the Chinese or their own co-religionists in the East Roman Empire in coping with their Nomad adversaries. The Ghuzz and the Cumans, who broke in rapid succession out of the heart of the Eurasian Steppe into the Great Western Bay in the sixth decade of the eleventh century,⁴ when Byzantine Kiev was verging towards her decline, were held at the borderline between Steppe and Forest, and were prevented from trespassing on Russian ground, as effectively as, some hundred and sixty years earlier, the Pechenegs had been checked at the same line by a Varangian Kiev⁵ which, in the ninth century, had been in the first vigour of a barbarian adolescence.⁶ And though, less than two hundred years after the Cumans had been brought to a halt, the Russian forest

¹ See the present chapter, p. 306, above.

² The chapter of Russian history which is officially known as the 'Time of Troubles' is, of course, not this, but an interlude at the beginning of the seventeenth century when there was a momentary collapse of a Muscovite Empire which was the Russian universal state (see I. C (i) (a), vol. i, p. 53, footnote 2; II. D (v), vol. ii, pp. 157 and 176; and IV. C (ii) (b) 2, vol. iv, pp. 90 and 91-2, above; and V. C (ii) (a), vol. vi, p. 195, footnote 2, and V. C (ii) (b), vol. vi, p. 311, below).

³ See IV. C (ii) (b) 2, vol. iv, p. 96, footnote 1, above.

⁴ See Part III. A, Annex II, vol. iii, p. 416, above.

⁵ The Varangian principality of Kiev had held, for the benefit of all the other Varangian 'successor-states' of the Khazar Empire, the front along which the Varangian Viking heirs of the forest-clad dependencies of the Khazar Empire in the north-west had come to march with the rival Pecheneg Nomad heirs of the Khazar Empire's home territory in the Great Western Bay of the Eurasian Steppe (see p. 288, above). No doubt it was in virtue of their service as wardens of the marches of the Scandinavian World that the Varangian princes of Kiev acquired a hegemony over all the other Scandinavian 'successor-states' of the Khazar Empire, from the banks of the Middle Dniepr to the shores of Lake Ladoga (see p. 288, footnote 3, above, together with II. D (v), *passim*, in vol. ii).

⁶ Even, however, in this time of her youth and strength Kiev had found her powers taxed to the utmost by the task of barely keeping the Nomads at bay, and this historical fact is faithfully reflected in the mirror of the Russian 'heroic' poetry (see pp. 288-9, above). 'The warfare of the Kiev Cycle is almost wholly defensive' (Chadwick, H. M. and N. K.: *The Growth of Literature*, vol. ii (Cambridge 1936, University Press), p. 95).

bowed to the earth under the unprecedentedly furious impact of the Mongol tornado—a blast which had been gathering momentum all the way as it swept across Eurasia from the Kerulen to the Dniepr—these Russian tree-trunks even then bent without breaking.

During the two and a half centuries that elapsed between Bātū Khan's sack of Kiev in A.D. 1240 and the Muscovites' capture of Saray-on-Volga in A.D. 1502, the states of Russian Orthodox Christendom—including distant Novgorod on the Baltic slope, as well as the Russian communities in the basins of the Dniepr and the Volga—were all of them for most of the time under the Tatar yoke, except in so far as they succumbed, instead, to the alternative barbarian domination of the forest-dwelling Lithuanians.¹ Successive Russian attempts to throw off the Tatar suzerainty were severely punished. Even as late as A.D. 1382, when the principality of Muscovy had already succeeded in uniting a large part of the Russian World under its own lordship, a Muscovite repudiation of allegiance to the Khan of the Golden Horde was conclusively proved to be premature by Toqatmysh's retaliatory sack of Moscow.² And it was only the union of Muscovy with Novgorod in A.D. 1478—exactly a hundred years after the first Muscovite act of defiance—that created at last a Russian Power which was of a calibre to defy with impunity a Tatar Power which was now *in articulo mortis*. These facts show how long and how heavily the Russians were weighed down by the Tatar incubus; yet they never allowed it to crush them. Their servitude did not go beyond the payment of tribute to Tatar overlords who continued to dwell on their native steppes; and there was no installation of a Tatar ruling caste in the Russian cities, after the fashion of the Manchu 'bannermen' in China or the Turkish war-bands of the 'Slave-Kings' and their successors in Hindustan.

This successful Russian passive resistance to Nomad aggression during the Russian 'Time of Troubles'³ prepared the ground for Russian Orthodox Christendom to pass over to the offensive in the age of the universal state that was brought into existence by

¹ For the south-eastward expansion of these pagan Lithuanian barbarians, at the White Russians' and the Red Russians' expense, until in A.D. 1363 they reached the shores of the Black Sea between the mouths of the Dniepr and the Dniestr, see II. D (v), vol. ii, p. 172, and Part III. A, Annex II, vol. iii, pp. 424 and 428, above. The Red Russians are, of course, identical with the Ruthenians, and these with the Ukrainians. For the relative prosperity of the Red Russian principality of Galicia, by comparison with other parts of Russia, during the first century of the Mongol domination which was the sequel to Batu's raid, see V. C (ii) (b), vol. vi, p. 310, footnote 2, below. In the course of the fourteenth century of the Christian Era Galicia was annexed to the Western World through being united politically with the Kingdom of Poland and ecclesiastically with the Western Christian Church.

² See I. C (i) (b), Annex I, vol. i, p. 374, footnote 1, and II. D (v), vol. ii, p. 147, above.

³ In the sense in which the term is used in this Study (see p. 311, footnote 2, above).

the union of Novgorod with Muscovy. And this Russian counter-offensive against the Eurasian Nomadism has been a unique operation in the annals of the warfare between the Eurasian Nomads and the sedentary societies round about; for the Russians have gained a victory over the Nomads which, to all appearance, is complete and definitive.

In this last chapter of the history of Russian Orthodox Christendom's anti-Nomad front the master-stroke of the Empire of All the Russias has been to enlist in its service, as disciplined hunting-dogs, the Cossacks who had made their first entry into the Eurasian amphitheatre as wild wolves snapping at the flanks of the Golden Horde.¹ This remarkable metamorphosis of the Cossacks from barbarians into barbarian-fighters was not accomplished without a struggle;² and the parent Cossack war-band in the 'Sich' in the Dniepr eventually proved intractable. These Dniepr Cossacks could never forget their original freedom from any master; and, even when, in the sixteenth century, they had found it necessary to compromise their liberty by entering into political relations with one of the neighbouring sedentary Powers, their first choice for their suzerain had been Poland-Lithuania. They had only subsequently come under the suzerainty of Muscovy—and this by a voluntary transfer of allegiance which was transacted, in A.D. 1654, through the negotiation of a formal treaty between the Cossack Hetman and the Muscovite Tsar. With this history behind them it is not surprising that the Dniepr Cossacks were unable to accommodate themselves to the requirements of a Muscovite autocracy which, from Peter the Great's time onwards, was inspired by the modern Western as well as by the medieval Byzantine tradition of absolutism. After the last great Cossack revolt against Muscovite authority in A.D. 1773 the Dniepr 'Sich' was dissolved, and the Cossack 'Die-Hards' fled to the Ottoman dominions, where new homes in the neighbourhood of the Danube Delta were granted to them by the Pādishāh. The majority of the Dniepr Cossacks, however, submitted, in this extremity, to the Tsar, and suffered themselves to be deported from their island fastness in the Dniepr, where they had been ensconced for some four hundred years, to more fertile fields along the right bank of the Kuban, where they were now set to guard the western half of the Russian Empire's anti-barbarian front over against the highlanders of the Caucasus, between the coast of the Sea of Azov and the right flank of the Cossacks of the Terek. In the meantime the Russian Imperial Government had met with less recalcitrance from the daughter

¹ See II. D (v), vol. ii, pp. 155-6, and the present chapter, pp. 283-4, above.

² See V. C (i) (c) 2, p. 104, above, and V. C (i) (a), vol. vi, pp. 227-8, below.

Cossack war-bands on the Terek¹ and the Don and the Yaik; and, when once these had been gradually and peacefully incorporated into the Imperial administrative system, it was an easier step still for the Imperial Government to garrison hitherto unguarded river-lines with new Cossack settlements whose fighting-men were ready to eat out of the hand of an Imperial master to whom their *stanitzas* owed their very existence.²

Under the Imperial Russian Government's authority and direction the two new 'hosts' of Orenburg Cossacks and Siberian Cossacks were planted, in the course of the eighteenth century, beyond the left wing of the Yaik Cossacks, across the wide gap in the Russian frontier-defences on the northern threshold of the Eurasian Steppe between the Ural Mountains and the Altai. Thereafter, in 1867, the Siberian dominions of the Empire, north of the Steppe, were linked up with the new dominions, south of the Steppe, in the Oxus-Jaxartes Basin, which the Imperial Government was then in process of conquering,³ by the establishment of a Semiriev Cossack 'host' between the left flank of the Siberian Cossacks, on the right bank of the Upper Irtysh, and the newly acquired province of Farghānā in the valley of the Upper Jaxartes.⁴ This settlement of the Semiriev Cossacks was proof positive of the Eurasian Nomads' utter discomfiture, for the new Cossack line cut the Eurasian Steppe in two by closing the Zungarian Gap between the Altai and the Tien Shan.

Nevertheless the occupation of this vital line across 'the Seven Rivers' by the Semiriev Cossack 'host' in A.D. 1867⁵ is not to be

¹ The Cossack community on the Terek seems to have been founded in A.D. 1579 and to have formally acknowledged the sovereignty of the Muscovite Empire in A.D. 1712 (Allen, W. E. D.: *A History of the Georgian People* (London 1932, Kegan Paul), p. 164; idem, in *The Baltic and Caucasian States* (London 1923, Hodder & Stoughton), p. 194).

² A map of Eurasia, showing the area covered by the Steppe and the territories occupied by Cossack 'hosts', within the framework of the Russian Empire, on the eve of the Bolshevik Revolution of 1917, will be found in *The Round Table*, issue of June 1918, facing page 562. It will be seen from this map that, in addition to the several Cossack 'hosts' that were established in order to hold the anti-barbarian frontiers of the Russian Empire against the Eurasian Nomads and the Caucasian highlanders, three further 'hosts'—the Transbaikalian, Amur, and Ussuri Cossacks—were established in the Far East in order to confirm the Russian hold upon the new territories which the Tsardom had acquired from the Manchu Empire in the sixth decade of the nineteenth century.

³ The Uzbek Khanates in the Oxus-Jaxartes Basin were all conquered by the Russian Empire between A.D. 1863 and A.D. 1873.

⁴ This first essay in forging a direct link between the West Siberian and the Transoxanian territories of the Russian Empire was followed up sixty-three years later, in A.D. 1930, by the opening of the 'Turk-Sib' railway along a route which was approximately coincident with the line of the Semiriev Cossack cantonnements. The Bolshevik régime had swept the Cossacks away, yet it continued to pursue, by other means, the policy of expansion and consolidation in Eurasia for which the Cossacks, in their day, had shown themselves effective instruments in the hands of the Tsardom (for the progress of this expansion under the Soviet régime see Hubbard, G. E., in Toynbee, A. J., and Boulter, V. M.: *Survey of International Affairs, 1934* (London 1935, Milford), pp. 685-9).

⁵ The foundation of the Semiriev Cossack 'host' in that year was the latest instance of the effective establishment of a new Cossack community; but an abortive attempt to carry out the traditional policy on a new front was made, on the eve of the fall of the

compared, for audacity, with the occupation of the line of the Yaik in the sixteenth century by the Cossack 'host' which took its name from that single stream; for the Semirich Cossacks were established, with the whole strength of the Russian Empire behind them, at a date when the effective resistance of the Nomads had long since been broken, whereas the Yaik Cossacks performed their feat of cutting off the Great Western Bay from the heart of the Eurasian Steppe on their own unsupported initiative—and this in an age when a fresh Nomad eruption was still to come. In A.D. 1616 the newly formed Cossack line along the Yaik was broken through by the impact of the Torgut Calmucks;¹ but it was broken without being swept away; and, when the Don Cossack line brought the tide of Calmuck invasion to a standstill, the Yaik Cossack line closed in again at the Nomad invaders' rear and cut them off from their kin and kind. This successful absorption of the Calmuck shock by the elasticity of the Cossack buffer in the first quarter of the seventeenth century was the beginning of the end of the long struggle between the Russian Orthodox Christendom and its Nomad adversaries; and the eventual Russian counterstroke—which was delivered when the epigoni of the Calmuck intruders ebbed back into the heart of the Steppe in A.D. 1771²—was already a foregone conclusion in 'the sixteen-twenties'.

This apparently conclusive settlement of the problem of the Russian Orthodox Christendom's Eurasian Nomad frontier between A.D. 1616 and A.D. 1771 was facilitated by the *floruit*, in that age, of a restored Far Eastern universal state under the rule of Manchu empire-builders who, like the Cossacks, were sedentary barbarians from the borderland of the Steppe; for the Manchus, likewise, were as masterful towards the Eurasian Nomadism as they were familiar with it;³ and, when, in the latter part of the

Tsardom, during the General War of 1914-18. During this war 'the Russian military authorities on the Armenian front began to create a new Cossack line in the occupied Ottoman territory. Russian colonists were placed on the lands of the Armenians whom the Turkish atrocities had removed, and the infamous project was only put an end to by the Revolution' (*The Round Table*, issue of June 1918, p. 542).

¹ See Part III. A, Annex II, vol. iii, pp. 418 and 428, above.

² See Part III. A, vol. iii, p. 19, footnote 3, and IV. C (iii) (c) 3 (a), vol. iv, pp. 497-8, above.

³ For the non-Nomadic origin of the Manchus and for their attitude to the Eurasian Nomadism and to the Far Eastern Civilization respectively see II. D (v), vol. ii, p. 122, footnote 2, and Part III. A, vol. iii, pp. 16 and 19, with Annex II, p. 423, footnote 1, above. In the Manchu Imperial Government's policy towards the Nomads it is perhaps possible to detect a certain duality. While the Manchu Government showed the same determination and persistence as the contemporary Russian Government in imposing its authority upon recalcitrant and aggressive Nomads like the Zungar Calmucks, it adopted a patronizingly conciliatory policy towards quiescent Nomads, such as the Mongols were at this date, and especially towards the Imperial Manchus' own Nomad Manchu poor relations on the Transkingan enclave of the Eurasian Steppe. The Imperial Manchus, who were reducing the Zungars to subjection with China's resources and for China's benefit, were at the same time seeking to enlist the Nomad Manchus and the Mongols as reinforcements for the barbarian garrison with which the Imperial

seventeenth century of the Christian Era, the Manchu and Muscovite Empires came into contact with one another in Transbaikalia, the Eurasian Steppe was encircled—for the first time in history, so far as is known—by an unbroken ring of anti-Nomad Powers. Thereafter the Russian blow at the Torgut Calmucks which was delivered in A.D. 1771 was anticipated by the greater feat of the Manchu Emperor Ch'ien Lung (*imperabat* A.D. 1735–96) in breaking the power of the Torguts' more formidable kinsmen the Zungars.¹

Through the simultaneous coercive action of the Manchu and Muscovite Powers—a converging movement which was not the less effective for not having been concerted—it looked as though a greater and more momentous historical result had been achieved than the mere victory of this or that sedentary society over the Eurasian Nomads of a particular time and place. It looked as though, in the Eurasian arena, the Nomadic Civilization itself had at last been defeated decisively in its vaster struggle with a long array of civilizations of the sedentary class. And, though the blows delivered in 1755 and in 1771 broke the Nomads' military and political power without thereby putting a stop to the Nomadic way of life, it seemed merely a question of time for the Nomad herdsman himself to vanish from the face of the Earth before the relentless and irresistible advance of the cultivator and the industrialist.² The Great Society of a Westernized World seemed to have licence to commit the most outrageous crimes and follies against itself without jeopardizing its apparently automatic progress at the Eurasian Nomadism's expense. The Chinese Revolution of A.D. 1911 might throw a China that was in process of Westernization into interminable social disorders, and yet the colonization of the Nomads' ancestral ranges in Inner Mongolia and Manchuria by Chinese peasant settlers might be actually stimulated by the pressure of brigandage, war, pestilence, and famine which the Revolution had brought to bear upon the settlers' ancestral homes in Honan or Shantung. The Russians might be driven to the

Manchus were also holding China down. For the provenance and organization of the Manchu Power's garrisons in China see Lattimore, O.: *The Mongols of Manchuria* (London 1935, Allen & Unwin), pp. 146–8. The unit was the 'banner', which always included a Manchu battalion, and usually a Chinese and a Mongol sister battalion as well. These composite 'banners' were stationed, in groups of varying strength, in the principal cities of Manchuria-within-the-Pale and Intramural China. 'Mongol "banners", forming battalions of the Manchu "banner" regiments, had no tribal function; they consisted of Mongols recruited from the tribes and thereby detached from their native tribal organizations to form hereditary professional troops.' At the same time (see Lattimore, *op. cit.*, pp. 145–6 and 148–51), as the Manchus progressively imposed their rule upon Mongolia as well as upon China, they put the existing Mongol tribal units on a regular permanent footing by organizing them as 'banners' in a second meaning of the term which is not to be confused with its usage to denote a cadre of the Manchu standing army.

¹ See IV. C (iii) (c) 3 (α), vol. iv, pp. 497–8, above.

² For the Nomad's apparent doom see Part III. A, vol. iii, pp. 16–22, above.

slaughter by the million in the European War of 1914-18 and might finally fall out of this frying-pan into the fire of revolution, and yet Russian hands could find time between August 1914 and October 1917 to cause the death of thousands of Qāra Kirghiz¹ Nomads who had been stampeded into a panic by rumours that they were to be wrenched out of the only way of life that they could conceive, in order to be conscripted for non-combatant service behind the Russian military front.² Thus it seemed until the other day as though the Nomads could only be implicated in the sedentary civilization's self-inflicted fate and could not look for a reprieve from it.

This continued to be the outlook until the autumn of 1931; but by 1938 the Japanese military outbreak on the Asiatic Continent, and the policy of aggressive expansion which the powers behind the throne at Tokyo had been pursuing for seven years by then, had put a different complexion upon the Nomads' prospects; for the Nomads' two latter-day oppressors, the Chinese and the Russians, were the Japanese imperialists' principal victims, and therefore their principal adversaries, in their continental adventure; and it was a short step from this for the Japanese to single out the rear-guard of the Nomads to be their own protégés and allies. In making up their puppet-state of 'Manchukuo' out of the four conquered Chinese Eastern Provinces, the Japanese empire-builders ostentatiously granted the local Mongol 'banners' their autonomy and put a stop to the process of Chinese peasant colonization at the Mongols' expense.³ And next door, in the Inner Mongolian territories west of the Mongolian province of Jehol which had been incorporated into 'Manchukuo', the Mongols were consequently able to make a bargain for themselves, on equivalent terms, with the Government of the Chinese Republic—under tacit threat of opening the way for a further westward encroachment of Japanese imperialism at China's expense, unless the Chinese were willing to make it worth the Mongols' while to remain faithful to their allegiance to Nanking.⁴ As for Outer

A damning confirmation of this Polish scholar's indictment, out of the ulpit's own mouth, will be found in the extracts translated from the official provincial gazette *Semiriechen-skiya Oblastniya Vedomosti*, Nos. 200-15, in the British Admiralty publication *Manual on the Turanians and Pan-Turanism* (London, no date, H.M. Stationery Office), pp. 229-34.

³ See Toynbee, A. J., and Boulter, V. M.: *Survey of International Affairs*, 1932 (London 1933, Milford), pp. 443-5 and 459.

⁴ See Hubbard, G. E., in Toynbee, A. J., and Boulter, V. M.: *Survey of International Affairs*, 1933, pp. 464-6; 1934, pp. 683-5.

Mongolia, which had accepted a Russian in place of a Chinese suzerainty after the Chinese Revolution of 1911, and had become a Soviet Socialist Republic in 1924,¹ it remained to be seen whether its 'bannermen' would be affected in their turn by the revival of hope and ambition with which the Mongols of Inner Mongolia and 'Manchukuo' had already been inspired since the advent of the Japanese. By the year 1938, however, the Japanese imperialists had put their country's continental fortunes to the touch in a supreme military hazard; and, in the act, they had drawn into their arena the broad territories in the heart of Eurasia which the Mongols had managed still to retain at the end of four centuries of Russian and Chinese encroachment. Across the pasture-lands of their Mongol protégés—or pawns—the Japanese were then attempting to drive a wedge that was to prise asunder their common Chinese and Russian enemies.

Now that Gobi or Shamo had suffered the grievous misfortune of becoming an East Asian Armageddon, what was likely to be the fate of its last surviving Mongol Nomad denizens? Would they be able to extort a new lease of their old Nomadic life as the price of their military support? Or would they be exterminated to the last horde and herd? Or would they be saved alive—to lead a life-in-death—by being converted *en masse* into standardized replicas of the sedentary *Homo Mechanicus* who had been their bane? For Nomads of the Mongols' indomitably recalcitrant spirit, mechanization—if this third alternative was their destiny—might be more excruciating than annihilation.

¹ See Toynbee, A. J.: *Survey of International Affairs, 1920-3* (London 1925, Milford), pp. 428-31; and Hubbard, G. E., in *Survey of International Affairs, 1934* (London 1935, Milford), pp. 685-6. This Soviet Socialist Republic of Outer Mongolia was not taken into membership of the U.S.S.R.; and in the treaty of the 31st May, 1924, between the Soviet Government at Moscow and the Chinese Government at Peking, which had been signed a few months before the 'People's Republic of Outer Mongolia' was proclaimed, the U.S.S.R. had recognized Outer Mongolia as being an integral part of China under Chinese sovereignty (Art. 5). By the terms of the same article, however, the question of the Moscow Government's military occupation of Outer Mongolia had been left for future settlement (*Survey of International Affairs, 1925*, vol. II, pp. 334-5); and the Russian troops not only remained in command of Outer Mongolia: they also organized, trained, and equipped a Red Mongolian Army. It will be seen that the effect upon the Mongols of the impact of Russian and Japanese influences in the twentieth century of the Christian Era was running exactly counter to the effect of the impact of Tibetan influence in the sixteenth century. The conversion of the Mongols to the Tantric form of the Mahāyāna had counteracted their traditional militarism; their conversion to the Russian form of Western Communism or to the Japanese form of Western Capitalism seemed likely to bring back to Mongol ears the sound of 'ancestral voices prophesying war'. On the 12th March, 1936, the Soviet Governments of the U.S.S.R. and of Outer Mongolia signed a Protocol of Mutual Assistance, in which they undertook to come to one another's aid with their respective armed forces in the event of either of them becoming a victim of aggression at the hands of a third state. After this transaction had been made public, the Government at Moscow assured the Chinese Government that nothing had been done to change the *status quo ante* in the relations between the Soviet Union, Outer Mongolia, and China (Hubbard, G. E., in *Survey of International Affairs, 1936* (London 1937, Milford), pp. 934-5).

Vestiges and Rudiments in the Western World.

When we come, in conclusion, to the history of the relations between our own Western Civilization and the primitive societies which it has encountered, we can discern an early stage in which, like Hellenism in its growth-phase, this Western Christendom won converts through the sheer attraction of its charm. The most signal of these early converts were the members of the abortive Scandinavian Civilization, who eventually succumbed—and this in their native lairs in the Far North and in their distant settlements in Iceland, as well as in their encampments on Christian ground in the Danelaw and in Normandy—to the spiritual prowess of the civilization which these barbarians had been assailing by force of arms.¹ The contemporary conversion of the Nomad Magyars and the forest-dwelling Poles was equally spontaneous and is almost equally impressive. Yet, if these feats of peaceful penetration are worthy to rank with a growing Hellenic Civilization's cultural conquests in Italy and Asia Minor,² this early age of Western expansion into a barbarian world is also marred by crimes which surpass the criminality of the Hellenic pioneers' subjugation of the Mariandyni and eviction of the Pieres and extermination of the Eordaei and the Chônes.³

Through the misguided zeal of Charlemagne the Saxons were dragged into the fold of Western Christendom by the scruff of the neck;⁴ and, when, two centuries later, their own turn came to extend the bounds of Western Christendom at the expense of the rest of the North European barbarism, the converted descendants of Charlemagne's pagan Saxon victims went beyond the bad example that had been set them in the eighth century by their Austrasian conqueror. Between the latter part of the tenth century and the latter part of the twelfth the Saxons evicted the Slavs between the Elbe and the Oder;⁵ and beyond the Vistula, in the thirteenth and fourteenth centuries, the Teutonic Knights went so far as to exterminate the Prussians. On this sector of medieval Western Christendom's barbarian threshold it is evident that the relations between the growing civilization and the barbarians within its range went from bad to worse during the passage of

¹ See II. D (vii), vol. ii, pp. 347–60, above.

² See the present chapter, pp. 210–13, above.

³ For these crimes of the Hellenic Society in its growth-phase see the present chapter, pp. 210–11, above.

⁴ See II. D (v), vol. ii, p. 167; II. D (vii), vol. ii, pp. 345–6; IV. C (iii) (c) 2 (β), vol. iv, p. 322; IV. C (iii) (c) 3 (α), vol. iv, pp. 488–90; IV. C (iii) (c) 3 (β), vol. iv, p. 523; and the present chapter and volume, pp. 286–7 and 289–90, above.

⁵ See II. D (v), vol. ii, pp. 168–9, above. The only Slavs in this region who survived were the Abotrites, who saved themselves at the eleventh hour, after a protracted resistance, by volunteering to receive baptism. These Abotrite Slavs are the direct ancestors, after the flesh, of our latter-day Mecklenburger Germans.

the four and a half centuries that elapsed between the opening of Charlemagne's campaign against the Saxons in A.D. 772 and the beginning of the extermination of the Prussians by the Teutonic Knights after their evacuation of the Mediterranean and their migration to the Baltic in A.D. 1228; and the same melancholy picture of moral deterioration meets our eyes when we turn away from the Continent to watch the contemporary progress of Roman Christianity in the British Isles. In this insular story the first chapter is the conversion of the English heathen by a tiny band of Roman missionaries without any force to back them; and these spiritual conquerors of Ultima Thule had been dispatched from Rome on their distant and perilous enterprise by a Pope who had the greatness of heart to take thought for a remote tribe of pagan barbarians at a moment when the schismatic barbarian Lombards were beleaguering him in his own see.¹ It is a sad fall from this height to the level of the next chapter, which records the coercion of the Far Western Christians of 'the Celtic Fringe' by a series of turns of the screw which began with the decision at the Synod of Whitby in A.D. 664 and culminated in the armed invasion of Ireland by King Henry II of England, with Papal approval, in A.D. 1171.²

It will be seen that, in the record of our Western Christendom's relations, in this early phase, with the primitive societies round about, there are more entries on the debit and fewer on the credit side than in the corresponding chapter of the Hellenic Society's account. Nor was this chapter in our own Western account entirely closed by the almost complete elimination of the North European barbarians before the end of the fourteenth century of the Christian Era through the combined operation of the diverse processes of conversion, subjugation, eviction, and extermination. It is true that by A.D. 1400 Western Christendom had expanded up to the 'natural frontiers' of the Atlantic Ocean on the west and the Arctic Circle on the north, while on the east it now marched with Orthodox Christendom from a point on the coast of the Adriatic to another point on the coast of the Arctic Ocean;³ and it is also true that, after the Lithuanians had insured themselves—through an alliance with the Poles and a simultaneous act of conversion to Western Christianity⁴—against being overtaken by their Prussian kinsmen's cruel fate, the only surviving patches of Continental European barbarism were a few scattered enclaves in such natural fastnesses as Bosnia and the Scottish Highlands and Western Ireland. But the tradition of 'frightfulness' to which the Western

¹ See III. C (ii) (b), vol. iii, p. 269, above.

² See II. D (vii), vol. ii, pp. 333-40, with Annexes II and III, above.

⁴ See II. D (v), vol. ii, pp. 172-4, above.

Christians had enslaved themselves in their medieval warfare with primitive peoples on the Baltic and the Celtic fronts was unhappily to show a greater vitality than the European barbarians themselves who had been its first victims. Habits acquired by generations of English and Scottish borderers along the Irish Pale and the Highland Line have continued to assert themselves in the behaviour of these medieval Western barbarian-fighters' descendants towards the previously unknown barbarians of a new world which has been brought within our range by the maritime discoveries at the beginning of the Modern Age. And the North American Indian and the Tropical African Negro have been, in their turn, the victims of a ruthlessness which was first evoked on this side of the water in long since forgotten struggles with 'Wild Highlanders' and 'Wild Irishmen'.¹

In the expansion of our Western Civilization over the whole face of the planet in the course of the Modern Age of Western history the impetus of the expanding body social has been so strong, and the disparity in strength so extreme between the aggressive West Europeans and their primitive victims, that the movement of expansion has been apt to sweep on unchecked, from the line at which the West European pioneers have made their first impact on the 'Natives',² until this running fight between two unequally matched forces has reached its term at a 'natural frontier'. We have seen how the English settlers in North America have swept the Red Indians almost out of existence from the Atlantic to the Pacific coast, and how the later opening-up of Tropical Africa by the competitive enterprize of half a dozen West European Powers has resulted in the subjugation of the African Negroes from the Atlantic to the Indian Ocean and from the Sahara to the Kalahari Desert.³ In this world-wide modern Western offensive against the rear-guard of the primitive societies extermination or eviction or subjugation has been the rule and conversion the exception. Indeed, we can count on the fingers of one hand the number of the primitive societies that our modern Western Society has taken into partnership with itself.

There are the Scottish Highlanders,⁴ who were one of those

¹ For this load of *karma* see II. C (ii) (a) 1, Annex, in vol. i, pp. 465-7, above.

² For the connotation of this word in the vocabulary of Modern Western Imperialism see I. B (iii), vol. i, p. 33, and I. C (iii) (b), vol. i, pp. 151-3, above.

³ See the present chapter, p. 207, above. One of the incidents in this opening-up of Africa by West European Powers in the last quarter of the nineteenth century of the Christian Era was the extinction of the militant barbarian Power which had been established in the Eastern Sudan by the Baggara Arabs, under the leadership of the Mahdi Muhammad Ahmad, on the ruins of the abortive Egypto-Ottoman empire in the upper basin of the Nile (see the present chapter, pp. 295-6, above, and 324, below).

⁴ See II. C (ii) (a) 1, vol. i, p. 237; II. C (ii) (a) 1, Annex, vol. i, pp. 465-7; II. D (vii), vol. ii, p. 311, and the present chapter and volume, p. 207, above.

rare enclaves of untamed European barbarians that were bequeathed¹ to the modern Western World by a medieval Western Christendom. There are the Maoris, who were encountered by the Scottish and English settlers in New Zealand in the nineteenth century. And there are the Araucanians in the barbarian hinterland of the Chilean province of the Andean universal state,² with whom the Spanish settlers in Chile have had to deal since the Spanish conquest of the Inca Empire in the sixteenth century. In these three instances the process of cultural conversion has finally prevailed over the alternatives; but even here this solution has only been accepted by the aggressor after the methods of coercion have been tried and found not worth the price of the desperate resistance which they were evoking.³

The test case is the history of the incorporation of the Scottish Highlanders into our modern Western body social after the failure of these White Barbarians' last kick against the pricks in A.D. 1745; for the social gulf between a Dr. Johnson or a Horace Walpole and the war-bands that carried Prince Charlie to Derby was probably not much less difficult to bridge than the gulf between the Western Society of the nineteenth century and the contemporary Maoris and Araucanians. At the present day the great-great-grandchildren of Prince Charlie's shaggy warriors are undoubtedly of one standardized social substance with the descendants of those bewigged-and-powdered Lowlanders and Englishmen who were the victors in the last round of a struggle that reached its end nearly two hundred years before the present volume was published. To-day the epigoni of both parties to that ancient warfare are partners in business and politics and recreation and literature and art, without its being possible for the sharpest-sighted observer to detect even a trace of the historic social cleavage. Yet this happy result cannot be claimed as a clear and unalloyed triumph of the way of Gentleness in contrast to the way of Violence; for, on an impartial examination of the methods by which this act of social assimilation has been accomplished

¹ See the present chapter, pp. 320-1, above.

² For these Araucanian barbarians beyond the frontier of the Inca Empire along the River Maule see the present chapter, p. 280, above.

³ 'For over two hundred years the frontier-line [between Araucanian natives and Spanish colonists in Chile] shifted back and forth of the River Biobio, with a story of struggle exactly similar to that between the Saxons and the Wendish Slavs at the River Elbe from the ninth to the twelfth centuries in Europe. The Araucanians were never conquered, and held all their territory. In 1870 they accepted peacefully the sovereignty of Chile, and traders with disease and alcohol, and farmers with their ploughs, entered their country; but no compulsory training in civilized ways was imposed upon them. Steadily their aboriginal population declined, and continues to decline' (Macleod, W. C.: *The American Indian Frontier* (London 1928, Kegan Paul), pp. 117-18). With slight changes, this passage could be adapted to give an accurate description of the history of the relations between the Maoris and the British settlers in New Zealand.

since the middle of the eighteenth century, it might be difficult for an honest jury to declare that the implacable repression of the Highlanders' ancestral costume and customs has been a less potent factor in the process than the generous admission of the discomfited barbarians to share in the privileges and opportunities of modern Western social life as lived in the United Kingdom.

There are, of course, other barbarians who have managed, in the midst of an elsewhere Westernized World, to hold their own—both unconverted and uncoerced—until to-day, or at any rate until yesterday. But, like the successfully converted Araucanians, these still obstinately persisting barbarian enclaves have been legacies from non-Western civilizations that have not yet been completely absorbed into our Western body social.

We have seen, for example,¹ that the modern Western empire-builders in the Hindu World have been obliged to take over from their Sikh and Mughal predecessors the responsibility for holding the North-West Frontier of India against the highlander barbarians of Eastern Iran; and we have also observed that the British Rāj has had this Indian North-West Frontier problem on its hands for no less than a hundred years without having yet succeeded in solving it. We can now call to mind several other anti-barbarian frontiers of the same kind that have been inherited from other non-Western civilizations by other Western or Westernized Powers. In the eighteenth century a Westernized Russian Empire inherited from a Byzantine Muscovy one anti-barbarian frontier over against the Eurasian Nomads and another over against the highlander barbarians in the Caucasus, while a nineteenth-century France has inherited from a broken-down Arabic Society in the Maghrib one anti-barbarian frontier over against the Afrasian Nomads in the Sahara and another over against the highlander barbarians in the Atlas. When we compare the French and Russian handling of the barbarians on these four fronts with the British handling of the barbarians on the North-West Frontier of India, we shall notice that both the Russians and the French have carried out that 'totalitarian' policy of conquering the barbarians outright which the British first tried and then abandoned in Afghanistan.² The Russians subjugated the Eurasian Nomads in the eighteenth century³ and the Caucasian highlanders

¹ In the present chapter, pp. 304-5, above.

² See the present chapter, pp. 305-8, above.

³ See the present chapter, pp. 313-16, above. The only horde of Eurasian Nomads who were still beyond the reach of the Russian arm at the end of the eighteenth century were the Türkmens in Transcaspia, who lived by raiding Persia from their oasis-fastnesses—carrying away not only goods and cattle but also Shi'i slaves for the Sunni slave-markets in the Uzbeq Khanates. The Russians left these Transcaspian Türkmens alone until after the completion of their conquest of the Caucasus, and then attacked

in the nineteenth, while the French had mastered the Sahara before the nineteenth century closed, and have now completed in Morocco the military task upon which they entered in A.D. 1911¹ by reducing to submission, in the year 1934, the last of the 'dissident' Atlas Berbers.² In another part of the African field, in the Eastern Sudan, we have already recorded³ the abortive attempt of an imperfectly Westernized Egypto-Ottoman Power to push its anti-barbarian frontier southward from the First Cataract to the Equatorial sources of the White Nile. This Egypto-Ottoman commitment in the Nile Basin was subsequently taken over by the British; and in the last decade of the nineteenth century British arms eliminated the recalcitrant enclave of barbarism in this quarter by conclusive military operations⁴ in the manner of the Russians in the Caucasus and Transcaspia—in contrast to the less drastic British handling of the barbarians beyond the North-West Frontier of India.

If at this point we pause to ask ourselves our usual question—whether the External Proletariat has been stimulated, by its struggle for life, to any acts of creativity in the fields of religion and poetry—we shall find it hard to bring together in a single view the straggling army of barbarians with which our Western Civilization has had to deal in the course of a history which has ranged so widely both in Time and in Space. It would be superfluous to re-examine over again the brilliant creative works of those barbarian rear-guards in 'the Celtic Fringe' and in Scandinavia whose attempts to give birth to civilizations of their own were rendered abortive by their unsuccessful encounters with the nascent civilization of Western Christendom.⁵ We may pass on at once to the Modern Age of

them from a Transcaucasian base, from which they were able, thanks to their naval command of the Caspian, to make a lodgement on the opposite coast of that sea. Yet although the Türkmens were thus assailed from an unexpected quarter by adversaries who now had at their disposal the modern Western material technique—including both the steamboat and the railway—their resistance was so stubborn that it took the Russians thirteen years—from 1873 to 1886—to overcome it, whereas it had taken them no more than ten years—from 1863 to 1873—to conquer all the Uzbek Khanates in the Oxus-Jaxartes Basin (see p. 314, footnote 3, above).

¹ The French had reached the north-western foot of the Atlas *massif* when they had occupied Wajda (Oujda) in 1907, but it was not until they had completed their subsequent occupation of the Atlantic lowlands of Morocco by their entry into Fez (Fäs) in the spring of 1911 and into Marrākish in the autumn of 1912 that they took over from the Sharīf al *Makhsan* the task of holding the Moroccan 'highland line' and asserting the Sharīf's title to sovereignty on the highland side of it.

² For the competition between the Western Civilization, as represented by the French, and the Arabic Civilization, as represented by the Arabized Sunni Muslim population of the Atlantic lowlands of Morocco, for the cultural allegiance of the nominally Muslim, but practically still almost primitive barbarian, Berber highlanders in the Atlas see Toynbee, A. J.: *Survey of International Affairs*, 1925, vol. 1 (London 1927, Milford), pp. 126-7, and Toynbee, A. J., and Boulter, V. M.: *Survey of International Affairs*, 1937, vol. 1, pp. 524-7.

³ In the present chapter, pp. 209, footnote 3, 294-6, and 321, footnote 3, above.

⁴ See p. 321, footnote 3, above, and V. C (ii) (a), vol. vi, p. 227, below.

⁵ See II. D (vii), vol. ii, pp. 322-60, above.

Western history; and here we may content ourselves with a single example of barbarian creativity in each of the two spheres in which we have learnt to be on the look-out for it.

In the poetic field we may take note of the 'heroic' poetry which was cultivated in the sixteenth and seventeenth centuries of the Christian Era by the Bosniak barbarians¹ beyond the south-eastern frontier of the Danubian Hapsburg Monarchy. And this example is interesting, because it is an apparent exception which in reality proves the prevailing rule that the External Proletariat of a disintegrating civilization is not apt to be stimulated to the creation of 'heroic' poetry until the civilization with which the barbarians are at war has passed through its universal state and fallen into an interregnum which gives opportunity for a barbarian *Völkerwanderung*. In our survey up to the present point the only prominent exception to this rule which has come to our notice is the genesis of the 'heroic' poetry of the Serb external proletariat of Orthodox Christendom, which apparently goes back to the last phase of the Orthodox Christian 'Time of Troubles' on the eve of the establishment of an Orthodox Christian universal state in the shape of the Ottoman Empire.² On this showing, we should not expect to find any examples of 'heroic' poetry among the external proletariat of our Western World, since it is certain that our Western Civilization has not yet entered into a universal state, and uncertain whether it has even broken down.³ There is, however, one frontier of the Western World on which the local equivalent of a universal state was called into existence more than four hundred years ago by the formidable pressure of an alien civilization; and it is in the hinterland of this front that our Bosniak example of 'heroic' poetry presents itself.

We have seen⁴ that the Danubian Hapsburg Monarchy sprang from the defensive union, in A.D. 1526, of the states—or remnants of states—in the south-eastern marches of Western Christendom which were at that moment within striking distance of the Ottoman aggressor; and we have also seen that this hastily concluded union

¹ Accounts of this Bosniak school of 'heroic' poetry will be found in Chadwick, H. M.: *The Heroic Age* (Cambridge 1912, University Press), pp. 101-3; Subotić, D.: *Yugoslav Popular Ballads: Their Origin and Development* (Cambridge 1932, University Press), pp. 18-21; Chadwick, H. M. and N. K.: *The Growth of Literature*, vol. ii (Cambridge 1936, University Press), pp. 325-30, 356-8, 365.

² See the present chapter, p. 296, above. The historical events that have contributed themes to the repertory of the Classical School of Serb 'heroic' poetry fall within the years 1371-1485. The establishment of the Ottoman Empire may be taken as dating from the Ottoman conquest of Macedonia in A.D. 1371-2 (see Part III. A, vol. iii, p. 26, above); but the key-stone of the Ottoman arch was not fitted into its place until the conquest of Constantinople in A.D. 1453 by Sultan Mehmed II (*imperator* A.D. 1451-81) (see V. C (ii) (a), vol. vi, p. 191, with footnote 1, below).

³ See I. B (iv), vol. i, pp. 36-7, above, and V. C (ii) (b), vol. vi, pp. 313-15, below.

⁴ In II. D (v), vol. ii, pp. 177-90, above.

was preserved—by the continuance of the same external pressure that had produced it in the first instance—until our own lifetime, when, in A.D. 1918, the Danubian Hapsburg Monarchy fell to pieces in the political convulsion that gave the *coup de grâce* to the Monarchy's efficient cause, the Ottoman Empire. In terms of a simile which we have used in another place,¹ the Danubian Hapsburg Monarchy was a carapace which the Western Christian body social grew for itself, out of its own living substance, as a special means of protection against a particular and peculiar external danger; and this simile may be instructive for our present purpose, since it draws attention to the diversity in the appearance of the Monarchy as viewed from outside and viewed from within.

Looked at from a standpoint in the heart of Western Christendom, by an observer standing on the banks of the Rhine or the Po or the Scheldt, the Danubian Hapsburg Monarchy could never, even in its heyday, be mistaken for anything but a hollow shell which was as thin and as brittle as it was hard. Though the Hapsburg potentate at Vienna might pile the Imperial Crown of the Holy Roman Empire² upon the insignia of so many Danubian kingdoms and lands, no citizen of any state to the west of the Emperor's direct and hereditary dominions could possibly regard as a universal monarch a prince whose writ did not even run in the other principalities of the ramshackle empire of which he was the titular head—not to speak of the admittedly independent kingdoms of France and Spain and Portugal and England and Scotland and Denmark and Sweden and Poland-Lithuania. So far from having entered into a universal state, the Western World in the sixteenth century was farther away from political unity than it had been at any time since the days before Charlemagne's conquest of Lombardy. But though this was the truth about sixteenth-century Western Christendom, it was not the picture that presented itself either to the subjects of the Hapsburg Emperor or to his adversaries beyond the south-eastern frontier of his dominions. To these two contending parties in the drama in which the Emperor was a protagonist, he wore an aspect which he could never wear to any Western European spectator. On his own Danubian ground the Hapsburg filled the political horizon of friends and foes alike as the authentic *Caesarea Majestas*: the supreme head of a Western Christian World which had entered into an *union sacrée* under his leadership in order to stand at bay, in an oecumenical solidarity, against an Ottoman threat to its

¹ In I. C (iii) (b), vol. i, p. 156, footnote 1, above.

² The actual Imperial Crown of Charlemagne was still one of the historic treasures of Vienna down to the annexation of Austria by Germany in A.D. 1938.

existence. Thus, to all intents and purposes, the Danubian Hapsburg Monarchy did perform the part of a Western universal state from 1526 to 1918 in the eyes of all Europeans whose homes lay anywhere south-east of the Inn and the Isonzo. And it is perhaps not simply chance that a barbarian South-East European community living only just beyond the Hapsburg Monarchy's south-eastern pale should have produced in the sixteenth and seventeenth centuries of the Christian Era, when the Viennese Caesar was most conspicuously fulfilling his oecumenical mission, the most notable school of 'heroic' poetry that has yet arisen in any section of the external proletariat of the modern Western World.

The Bosniaks, who were the authors of this particular 'heroic' tradition, were a rear-guard of the Continental European barbarians who had previously had to endure the unusual—and unusually painful—experience of being taken between the two fires of an aggressive Western and an aggressive Orthodox Christendom. The radiation of the Orthodox Christian Civilization, which had been the first of the two to reach the Bosniaks, had been rejected by them, as we have seen,¹ when it came in its orthodox form; and it had only been able to insinuate itself in the schismatic guise of Bogomilism. This adherence to a Christian heresy had drawn upon the Bosniaks the hostile attentions of their Western Christian as well as their Orthodox Christian neighbours; and in these straits they had welcomed the advent of the 'Osmanlis and had made sure of the good-will of these all-powerful patrons by abandoning their Bogomilism and turning Muslim *en masse*.² Thereafter, under Ottoman protection, these Yugoslav converts to Islam took to playing, on the Ottoman side of the Ottoman-Hapsburg frontier, the same part as was played on the Hapsburg side by the Yugoslav Christian refugees from the territories which had fallen under the Ottoman domination.³ The two opposing sets of Yugoslav barbarian war-bands found an identical occupation in raiding on the one side the Ottoman Empire, which was now performing the function of a universal state for Orthodox Christendom, and on the other side the Hapsburg Monarchy, which was providing the façade of a universal state for the Western World;⁴

¹ In the present chapter, p. 295, above.

² See IV. C (iii) (c) 2 (β), vol. iv, p. 368, footnote 3, above.

³ For the refugee Serb *ushoci* (*Italici* Morlacchi) and *hajduci*, see the present chapter, p. 296, above.

⁴ Compare the two likewise opposing sets of Arab war-bands that conducted their raids and counter-raids across the North Arabian borderland between the Roman and Sasanian Empires in the age immediately preceding the Primitive Muslim Arab conquest of South-Western Asia. The Sasanian Empire was raided by the Ghassāni Arab wardens of the Roman marches east of Jordan and Orontes; the Roman Empire by the Lakhmi Arab wardens of the Sasanian marches west of Euphrates. The Banu Ghassān were Monophysite Christians, while the subjects of the Lakhmi princes of Hīrah were divided between Monophysitism, Nestorianism, and paganism (see Browne, L. E.: *The*

and on the same fertile soil of border warfare two independent schools of barbarian 'heroic' poetry, both using the medium of the Serbo-Croat language, grew up and flourished side by side¹—to all appearance, without exercising any influence upon one another.²

If we now wish to find among the external proletariat of our modern Western body social an example of creativity in the religious field, we must wing our flight from the Old World to the New and must take leave of the seventeenth-century frontier of the Danubian Hapsburg Monarchy in Yugoslavia over against the Bosniaks in order to reconnoitre the nineteenth-century frontier of the United States of North America over against the Red Indians.

It is remarkable that the North American Indians should have been capable of making any creative religious response at all to the challenge of European aggression, considering that they were almost continuously 'on the run' from the moment of the arrival of the first English settlers on the Virginian shore of the Atlantic coast of North America in the first decade of the seventeenth century down to the crushing of the last Indian attempt at armed resistance to the power of the United States in the Sioux War of 1890. It is still more remarkable that this Indian religious response, when it came, should have been, not violent, but gentle.

A priori a gentle reaction would not readily have been predicted of a primitive people whose martial qualities—a pride, an endurance, and a demonic energy on the war-path—have made so deep and so lasting an impression upon their White assailants and destroyers that to-day a legendary portrait of a Red Indian warrior

Eclipse of Christianity in Asia (Cambridge 1933, University Press), p. 13). For the conversion of the Serbs and Bosniaks from marauders into mercenaries see V. C (i) (d) 6 (α), pp. 462–3, below.

¹ Like the Orthodox Christian Serbo-Croat 'heroic' poetry of Bosnia, Herzegovina, and Montenegro, the Muslim Serbo-Croat 'heroic' poetry of Bosnia and Herzegovina survived the turn of the nineteenth and twentieth centuries of the Christian Era. 'One beg took a minstrel with him when he went to visit the spa of Rohitsch-Sauerbrunn in Styria in 1913' (Chadwick, *The Growth of Literature*, vol. ii, p. 438).

² Notwithstanding this apparent absence of reciprocal influence, the Serb and the Bosniak school displayed one prominent common feature which was doubtless acquired by both of them from the uniform impress of a common social environment. Like the epic poetry of the French external proletariat of the Andalusian Umayyad Caliphate, but unlike the general run of barbarian literature, the two Yugoslav schools of 'heroic' poetry were largely inspired by the 'politico-religious' motif of the Holy War (Chadwick, *The Growth of Literature*, vol. ii, p. 365). In this respect the literary history of the Ottoman-Hapsburg frontier in the sixteenth and seventeenth centuries of the Christian Era offers a sharp contrast to that of the 'Abbasid-East Roman frontier in the ninth and tenth centuries. On this latter frontier the contending 'borderers' were divided from one another not only by their differences of religious and political allegiance, but by a difference of language as well, and yet here, as we have seen (in the present chapter, pp. 256–7, above), the two schools of 'heroic' poetry which were generated on opposite sides of the line by the border warfare were both of them innocent of 'politico-religious' animus and each of them eager to seek inspiration from the other.

who is now physically extinct in consequence of the White Man's ruthlessness has become the conventional type of 'the Noble Savage' throughout the Western World.¹ It might rather have been expected that, if the Red Indians reacted by adopting the religion of their adversaries with some distinctive difference, they would seize upon, and exaggerate, the fanatical militancy of the New Englander's Puritan Calvinist Protestantism,² as in the Old World the Wāhhābī and Idrīsī and Sanūsī religious movements among the Afrasian Nomads have in fact seized upon the corresponding elements in Sunnī Islam in order to nerve their devotees for the ordeal of fighting, with their backs to the wall, against a Westernizing Ottoman Power and its British and French and Italian supplanters.³ Alternatively, if the Red Indians reacted by creating a new religion of their own out of their native religious experience, then this new Red Indian religion might have been expected to conform to the general type of the worship of a divine war-lord and his war-band with which we have now become familiar from Scandinavian and Gothic and Achaean and Hittite and Aryan examples which have come under review at earlier points in this chapter. So far from that, the new religion which the Red Indians did create—under stress of their rapid and tragic retreat towards an inexorable annihilation before the White Man's remorseless advance—displays the distinctive characteristics of the 'higher religions' that have been discovered by those prophets of the Internal Proletariat who have taken the path of Gentleness.

These distinctive characteristics present themselves with an impressive uniformity and persistence in the teaching and practice of a series of Red Indian prophets⁴ who arose from time to time between 'the seventeen-sixties' and 'the eighteen-eighties'. The series begins with two anonymous figures: the prophet of the Delawares (*profatus* A.D. 1762) and the prophet of the Munsee branch of the same tribe (*profatus circa* A.D. 1766–75); it continues in the Shawnee Tenkwatawa, 'the Open Door' (*profatus* A.D. 1795), and the Kickapoo prophet Kanakuk (*profatus* A.D. 1819–*post* 1831); and it culminates in the Far Western trio Smohalla (*profatus post* A.D. 1850) and the two Paiute prophets: Tavibo the

¹ 'Woe unto you! For ye build the sepulchres of the prophets and your fathers killed them' (Luke xi. 47) is a damning stroke of irony which could be applied to the European colonists and the Red Indian 'Natives' of North America almost as justly as it is applied in the Gospel to the doctors of the Jewish Law and the prophets of Yahweh.

² For this element in Protestantism, and for its share in the creation of our modern Western Race-feeling, see II. C (ii) (a) 1, vol. i, pp. 211–27, above.

³ For this militant religious reaction of the Afrasian wing of the external proletariat of the Ottoman Empire see the present chapter, pp. 295–6, above.

⁴ For an illuminating account of these prophets, with indications of their spiritual affinity with other religious leaders in other times and places, see Macleod, W. C.: *The American Indian Frontier* (London 1928, Kegan Paul), pp. 505–32.

Forerunner (*profatus prae* A.D. 1870) and Wovoka the Messiah (*profatus circa* A.D. 1886). The Delaware and Shawnee prophets arose in what has since become the State of Ohio;¹ Kanakuk in what has since become the State of Minnesota; Smohalla in the Rocky Mountains, near the border between the United States and Canada; Taviho and Wovoka in the more southerly western highland region of Nevada. It will be seen that the locus of the birthplace of the prophet of the day moved westward with the movement of the frontier itself. In each generation the would-be saviours of the primitive Red Indian society in North America made their epiphany in the neighbourhood of the line along which the White Man's pressure was being exerted at the time. They addressed themselves successively to the communities which at successive moments were in imminent danger of being subjugated or evicted or exterminated; and among these exposed and threatened communities the influence of each of the prophets in turn spread far and wide, partly as the result of long missionary journeys undertaken by the prophets themselves, and partly through the flocking of pilgrims to the prophets' own headquarters.

It is the more remarkable to find that the principal message of almost all these prophets was one of peace. And while they preached the establishment of this peace in the first instance between the Indian peoples themselves, as a necessary preliminary to to an *union sacrée* against the White intruders, they did not make their call upon their Indian hearers to cease fighting one another in order to direct their followers' arms against a common alien enemy. While they proclaimed that the Indians were a chosen people who were destined to a life of bliss in an earthly paradise in which the living would be rejoined by the souls of their ancestors, this Red Indian Messianic Kingdom was not to be conquered with tomahawks, and still less with bullets. It was to come through an act of God; and God would perform His act when His chosen people had done what was pleasing in His sight. The Indians' part was the spiritual task of watching and praying and the ritual duty of discarding all the innovations that they had accepted from the White Man. The prophets taught that it was the adoption of these alien tools and techniques that had drawn down God's displeasure upon His people, and that an abandonment of these unclean things was the sovereign means of recapturing God's

¹ The territory now occupied by this state member of the North American Union was not the ancestral domain of the Delaware and Shawnee tribes into which these three prophets were born. It was merely the temporary camping-ground of broken fragments of tribes which had long since been evicted from their original homes. Before it gave birth to a prophet, each of these tribes had been 'on the run' before the face of the White aggressor for at least a hundred years.

blessing.¹ The first of the tools that they instructed their followers to lay aside were fire-arms (an injunction which sufficiently proves the good faith of their exhortation to render unto the White Caesar the things that were his, by submitting themselves to the authority of the White Man's Government). The prohibition further extended to peaceful utilities like the flint and steel which had been replacing the Indian's primitive fire-sticks; and it was even applied to agriculture by Smohalla, in whose remote homeland the art of cultivation had been unknown until the White Man's advent.²

The Indian prophets' general advocacy of Non-Violence in face of implacable aggression and intolerable provocation was justified by the event in the rare cases in which either the prophets or their followers lost their difficult faith in the virtue of forbearance. In the first generation of the series the Delaware prophet's religious movement was fatally compromised by the unhappy results of an experiment in militancy on the part of the Delaware's Ottawa disciple Pontiac, who had doubly perverted his master's doctrine by preaching that the object of establishing peace between warring tribes of Indians was to turn their united forces against the British, and that these alien intruders could not be fought effectively without resort to the two exotic weapons of the musket and a French alliance.³ In the next generation Tenkwatawa 'the Open Door' brought his own movement to destruction when in A.D. 1809 he abruptly abandoned the doctrine of Non-Violence which he had been preaching for fourteen years, and took, instead, to a militancy which was the practice of his brother Tecumseh 'the Meteor'.⁴ Finally, the Ghost Dance Religion—the

¹ This notion that, in coping with a more potent culture than one's own, the disastrous error—or deadly sin—is to attempt to fight the aggressive culture with its own weapons, is the fundamental idea of the 'Zealot' reaction (for the alternative 'Zealot' and 'Herodian' reactions to the impact of an alien culture see Part IX, below). The classic exponents of the idea have been the Jewish Zealots from the days of Judas Maccabaeus to the days of Bar Kōkabbā (see V. C (i) (c) 2, pp. 68 and 126, above, and V. C (i) (d) 6 (8), Annex, pp. 657-9, and V. C (i) (d) 9 (7), vol. vi, pp. 120-3, below, with the references in the footnotes); but the Jewish Zealots of that age, like the Wahhābis at the present day, combined their puritanism with militancy, whereas the Red Indian prophets, like Johanan ben Zakkai and his rabbinical successors, have combined a similar puritanism with a doctrine of non-resistance.

² Agriculture and the worship of agrarian fertility gods were, of course, indigenous in the New World; and the art had spread from the Mexican Plateau to the region of the Great Lakes before the arrival of the first Europeans on the American side of the Atlantic (see II. C (ii) (a) 2, vol. i, p. 265, with footnote 1, above). The first English settlers in New England found the local Indians cultivating maize; and the three Delaware and Shawnee prophets all arose in communities in which the indigenous agriculture of the New World was in use. These Indian prophets in the east of the Continent thus had no reason to repudiate agriculture, since it would never have occurred to them to class it with fire-arms as a European invention.

³ For Pontiac's 'Beaver War' (*gerebatur* A.D. 1763-5) see Macleod, *op. cit.*, pp. 407-23. For the untoward effect of Pontiac's unsuccessful excursion into militancy upon the fortunes of the Delaware prophet's religion see *ibid.*, p. 515.

⁴ For the Battle of Tippecanoe (*commisum* A.D. 1811) and its disastrous effects upon the fortunes of Tenkwatawa's religion see Macleod, *op. cit.*, pp. 519-21. In A.D. 1814 a comparable disaster overtook the Creek converts to Tenkwatawa's religion when the

fine flower of the Red Indian Messianic Movement, which Tavibo the Forerunner created and handed on to Wovoka the Messiah—sustained a mortal blow when Wovoka's Sioux converts made their desperate and disastrous military outbreak in 1890, and this in spite of the fact that the Sioux insurrection against the United States Government had not been directly inspired by Wovoka's teaching.¹ The Ghost Dance Religion of Tabivo and Wovoka could not give victory to the Sioux warriors in their forlorn hope; but the Dreamer Religion of the older western prophet Smohalla did inspire Chief Joseph and his Nez Percés in 1877 to endure the horrors of a thirteen-hundred-and-twenty-miles-long retreat under the pursuit of a relentless enemy.² As a sheer feat of heroic endurance the Nez Percés' trek in 1877 is worthy to rank with the Torgut Calmucks' trek in 1771;³ and these two long-drawn-out agonies of revolt and flight may be remembered in history as Abel's last protest against Cain in the Old World and in the New World respectively.

At the time of writing it looked as though, for the few antique barbarian communities that still remained on the map of a by this time almost completely Westernized world, the only chance of survival would lie in adopting the tactics of the Abotrites and the Lithuanians, who, in the medieval chapter of the history of the expansion of Western Christendom, had had the foresight to anticipate a forcible by a voluntary conversion to the culture of an aggressive civilization which was too strong for them to resist.⁴ In our latter-day remnant of an antique barbarian world there were still standing out, in 1938, two closely beleaguered fastnesses of Barbarism in each of which an enterprising barbarian war-lord had latterly been making a determined effort to save a perhaps not yet quite hopeless military and political situation by launching a vigorous cultural offensive defensive.

In North-Eastern Iran it seemed possible in 1938 that the North-West Frontier problem of the British Indian Empire might find its solution, not in any drastic military action against the untamed barbarians on the Indian side of the Indo-Afghan frontier, but rather in the Westernization of Afghanistan herself; for one of the crucial issues in this at that time still callow social movement in Afghanistan was the question whether the Central Government at Kabul could succeed in establishing its effective authority over the

local exponents of the Shawnee prophet's faith followed their master's inauspicious example by plunging, in their turn, into militancy (*ibid.*, p. 520, footnote 2).

¹ See Macleod, *op. cit.*, p. 528, with footnote 2.

² *Ibid.*, pp. 499-501.

³ See Part III. A, vol. iii, p. 19, IV. C (iii) (c) 3 (α), vol. iv, p. 498, and the present chapter and volume, p. 315, above.

untamed barbarians on the Afghan side of the same line; and, if this Afghan endeavour were to achieve success, one of the effects would be to place the war-bands on the Indian side between two fires and thereby make their position ultimately untenable. The Westernizing movement in Afghanistan, with which the Indian frontier problem was bound up, had been launched by King Amānallāh (*regnabat* A.D. 1919-29) with a radical excess of zeal¹ which was a caricature of the contemporary statesmanship of a Mustafā Kemāl Atatürk and a Rizā Shāh Pehlevī; and this intemperance had cost the royal revolutionary his throne. Yet King Amānallāh's personal fiasco was perhaps less significant than the fact that the check had not proved fatal to a movement which had had this unfortunate start. By 1929 the process of Westernization had already gone too far, and a desire for it—or, at least, an acquiescence in it—had become too widespread, for the people of Afghanistan to put up with the unmitigated barbarian reaction of the brigand-rebel Bacha-i-Sakkā ('the Water-Carrier's Son'); and under the régime of King Nādir and his successor the process had been unobtrusively resumed and carried on with a tact which seemed to promise more substantial results in the long run than the ex-King Amānallāh's provocatively sensational gestures.²

The outstanding Westernizer of a beleaguered barbarian fastness in A.D. 1938 was 'Abd-al-'Azīz b. 'Abd-ar-Rahmān Āl Sa'ūd, the King of the Najd and the Hijāz: a soldier and a statesman who, since A.D. 1901, had raised himself out of the political exile into which he had been born until he had made himself master of all Arabia west of the Rub'-al-Khālī and north of the Yamānī Kingdom of San'ā.³ During the thirty-eight years of his public career up to date Ibn Sa'ūd had been as resolute in asserting his authority against rivals and rebels as he has been moderate in the terms which he had accorded to his defeated adversaries. As a barbarian war-lord he could bear comparison with the Umayyad Yazīd I for affability⁴ and with the Amalung Atawulf for enlightenment.⁵ As a Westernizer he had apprehended the potency of the modern Western scientific technique and had shown a discerning eye for those applications of it—artesian wells and motor-cars and aeroplanes—that were particularly effective on the Central Arabian Steppe. But, above all, he had seen that the indispensable founda-

⁵ See the present chapter, pp. 226-7, above.

tion for a Western way of life was law and order. 'Abd-al-'Aziz Āl Sa'ūd stood head and shoulders above the most eminent of his Afghan contemporaries in moral and intellectual stature; and, since this was assuredly a case in which personality counted for more than any material conditions, Sa'ūdī Arabia appeared in 1938 to have a better prospect than Afghanistan of transferring herself from the ranks of the doomed barbarian war-bands to those of the states members of a Westernized Great Society—notwithstanding the fact that the steppes were more vulnerable than the highlands to military attack by the mechanical devices of twentieth-century warfare.

When the last obstinate enclave of antique barbarian life has been eliminated, in one or other of the alternative ways, from the cultural map of a Westernized World, shall we be able to congratulate ourselves on having seen the last of Barbarism itself? A complete elimination of the Barbarism of the External Proletariat would warrant no more than a mild elation, since we have convinced ourselves¹ (if there is any virtue in this Study) that the destruction which has overtaken a number of civilizations in the past has never been the work of any external agency, either human or inanimate, but has always been in the nature of an act of suicide.

'We are betrayed by what is false within.'² And this line of poetry, read in the light of our Western history since the autumn of the year 1935, may give an unintended turn to a passage in this Study on the subject of Abyssinia which was written in the autumn of 1931.

'“The common Christianity” of Abyssinia and the West, in a world which the radiation of our Western Christian Civilization has now unified upon a Western Christian basis, is a theme for satire to which only a Voltaire or a Gibbon could do justice.'³

The theme had not gone stale through seven years' keeping, but the intervening events⁴ had raised the question which of the two parties was to be the satirist's target. In plain words: Who were the barbarians? Which party had cast itself for the part? The Abyssinians, who in the interval had made a vain effort to defend themselves against an unprovoked attack? Or the Italians, who within the same span of time had broken their own deliberately given pledges under the Covenant of the League of Nations and the Briand-Kellogg Pact and the Italo-Abyssinian treaty of 1928 in order to break the Law of Nations, as well as the Law of God, by setting out to conquer a country which was not theirs and by levying war upon a miserably armed people with all the deadly

weapons—including poison gas—that have been added to our modern Western armoury by our modern Western science? If we are to pass beyond the baldly technical sense of the word 'barbarian', and to use it in its deeper moral connotation, then we are bound to declare that, when the Italians attacked and defeated and conquered their Abyssinian victims in East Africa in A.D. 1935-6, the reign of Barbarism in our Great Society was not curtailed but was, on the contrary, most formidably extended.

Who, let us ask ourselves again, are the true barbarians to-day, and where are they to be found? The familiar barbarians of the antique type may have been effectively wiped out of existence through the elimination of the last remaining no-man's-land beyond anti-barbarian frontiers which have now been carried up to the limits set by Physical Nature on every front in the World. But this unprecedented triumph will have profited us nothing if the barbarians, in the hour of their extinction beyond the frontiers, have stolen a march on us by re-emerging in our midst. And is it not here that we find our barbarians embattled to-day? 'Ancient civilizations were destroyed by imported barbarians; we breed our own.'¹ Are we not seeing a host of neobarbarian war-bands being recruited nowadays under our eyes in one country after another—and these in the heart, and not on the outskirts, of what has hitherto been a Christendom? What else but barbarians in spirit are the fighting-men in these *Fascii di Combattimento* and these *Sturmabteilungen*? Have they not been taught that they are the step-children of the Society out of whose bosom they have come, and that, as an aggrieved party with a score to pay off, they are morally entitled to conquer 'a place in the sun' for themselves by a ruthless use of force? And is not this precisely the doctrine that the war-lords of the External Proletariat—the Genseric and the Attilas—have always proclaimed to their warriors as they have led them 'over the top' to plunder some world that has lost the power to defend itself? Black shirts, and not black skins, were assuredly the badges of barbarism in the war that was waged in Africa in 1935-6. So much we can confidently declare; and with no less confidence we can add that the shirted barbarian is a more formidable menace to Society and a more appalling portent for the sociologist than the berserker of whom he has made a prey. The blackshirt is a portent because he is deliberately sinning against inherited lights, and he is a menace because, for the commission of this sin, he has at his disposal an inherited technique² which he is free to

² 'It is the possession of funded civilization which makes the illiterate and morally wild American hunter of the prairies more powerful in fight than the Red Man—the savage of Civilization more terrible than the savage of Barbarism. It is the funded

divert from God's to the Devil's service.¹ But in arriving at this conclusion we have not yet dug down to the root of the matter, for we have not yet asked ourselves what the source may be from which this Italian neobarbarism has been derived.

Towards whom was a Mussolini on the war-path directing his faculty of mimesis? Assuredly not towards his Abyssinian victims, whom he affected altogether to despise.² Our Italian war-lord fancied himself as the builder and not as the destroyer of an empire. In his own estimation he was not a Mihiragula but a Clive. He had stated, in terms, that he thought 'for Italy as the great Englishmen who have made the British Empire have thought for England, as the great French colonizers have thought for France'.³ His intended role was that of an eighteenth-century English or a nineteenth-century French empire-builder; and his West European critics should pause to reflect before angrily or contemptuously dismissing this latter-day Italian caricature of the deeds of their own forebears. A good caricature may be an illuminating portrait; and the Italians, after all, are noted for being past masters of the caricaturist's art. In the repulsive Italian countenance of a neobarbarian apostate from the path of Civilization we may be compelled, with shame and grief, to confess to a recognition of our English ancestors' authentic features. And a twentieth-century Italian dictator's naïve assumption of this old-fashioned West European mien is a formidable indictment of the character of his nineteenth-century and eighteenth-century French and English models. The indictment is formidable just because it is tendered, in complete good faith, as a tribute of admiration. For an imitation which is the sincerest flattery may also be the most crushing condemnation. 'In the last analysis' the inspiration of Signor Mussolini's neobarbarian imperialism would appear to be a Romagnol's Anglomania; and as soon as we admit this

civilization that they possess that alone makes *les classes dangereuses* really dangerous.'—Meadows, T. T.: *The Chinese and their Rebellions . . . to which is added an Essay on Civilization* (London 1856, Smith Elder), p. 518.

¹ The perversity which thus misuses the cultural heritage of Civilization is of the essence of Barbarism; and it is likewise practised, as we have already observed (on pp. 202–3, above), by those antique barbarians that are recruited direct from the ranks of Primitive Mankind. Its effectiveness, and, by the same token, its deadliness, is, however, far greater when the practitioners are neobarbarians who have been recruited, not from the extremities, but from the heart, of a body social that has broken down and gone into disintegration as a consequence of failure in an attempt at Civilization.

² While Signor Mussolini and his kind would have sincerely and indignantly repudiated the charge that they were leading their followers back to Barbarism, they bore unintended witness against themselves in their own unconscious attitudes and gestures. See L. S. Woolf: *Quack! Quack!* (London 1935, Hogarth Press) for synoptic photographs showing snapshots of Signor Mussolini and Herr Hitler addressing their followers set side by side with the 'still life' of graven images of barbarian war-gods. The unmistakable resemblance is as instructive as it is amusing.

³ Signor Mussolini in an interview given to the French publicist Monsieur de Kerillis, quoted in *The Times*, 1st August, 1935.

unpalatable truth we find ourselves compelled to trace back the origin of the neobarbarism in our midst to earlier events than the formation of the first *fascii di combattimento* in a post-war Italy. Are not these latter-day Italian Fascist war-bands the spiritual descendants of the ships'-crews of certain Elizabethan patron saints of the British Empire—a beard-singeing Drake and a slave-trading Hawkins?¹ To a Castilian historian the affiliation must be plain; and a Hindu philosopher who had the discernment to recognize, and the generosity to declare, that a conscience-smitten generation of post-war Englishmen and Englishwomen was sincerely and earnestly striving to shake off a disreputable English past might ask us gently—in a voice half compassionate and half ironic—whether we were really still so ignorant of the workings of the Universe as to flatter ourselves that a single good resolution would suffice to release us from a load of *karma* which had been accumulated for us by twelve successive generations of impenitently imperialist ancestors.

But must we not pursue our importunate question still farther? Ought we not to remind ourselves, at the close of this chapter, of our observation that, in the warfare between external proletariats and dominant minorities, it is usually the dominant minorities that denounce themselves as the aggressors by being the first to declare war and to take the offensive?² We have always to remember that the annals of this warfare between 'Civilization' and 'Barbarism', like those of the warfare between the sedentary societies and the Nomads,³ have been written almost exclusively by members of one only of the two parties to the dispute. The classic picture of the external proletarian, which portrays him in the act of carrying his barbarous fire and slaughter into the fair domain of some defenceless civilization, is therefore likely, *a priori*, to be not so much an objective presentation of the truth as an expression of the 'civilized' party's resentment at being made the target of a counter-attack which his own previous aggression has in due course brought down upon his head. The complaint against the barbarian, as drafted by his mortal enemy's pen, perhaps amounts to little more than an elaborate variation upon a simple theme which has been 'shown up' once for all by a nineteenth-century French wit:

Cet animal est très méchant:
Quand on l'attaque, il se défend!⁴

4. *Alien and Indigenous Inspirations*

The first criterion that we have applied in order to determine whether a particular civilization, in a particular stage of its history, is in process of disintegration has been the appearance of schism in the body social;¹ and in the course of a long empirical survey we have made ourselves familiar with the lines along which a disintegrating civilization is apt to split, and also with the composition and nature and characteristic works of each of the resulting fractions of the broken-down society. The tripartite division of a disintegrating civilization into three such fractions—a Dominant Minority and an Internal and an External Proletariat—was originally accepted at an early point in this Study² as a provisional working hypothesis on the strength of the single case of the breakdown and disintegration of the Hellenic Civilization. Our present muster of other examples will perhaps have confirmed us in the belief that these are, in fact, the three camps into which any disintegrating civilization tends to divide against itself; and in the light of our survey we shall perhaps also have come to the conclusion that the characteristic works of dominant minorities are schools of philosophy and universal states, and that internal proletariats display their creative power in the creation of 'higher religions' and of universal churches, while external proletariats express themselves in barbarian or dissenting religions and in 'heroic' poetry. Now that we have completed our study of schism in the body social, the next step that suggests itself is to attempt a complementary study of schism in the Soul. But, before we turn the page, we may pause to ask ourselves whether the foregoing investigation suggests any general considerations that may be worth dwelling upon for a moment.

One question of the kind, which almost thrusts itself upon our attention at this point, is that of the source from which the inspirations of these creative works of a disintegrating civilization are derived.

Our earliest definition of societies of the species 'civilizations' was that they were 'intelligible fields of study';³ and this empirical account of them, from the subjective standpoint of an historical observer, turned out to carry with it certain implications about the objective nature of the field of observation. It meant that, on the whole, the course of the lives of civilizations was self-determined, so that, for the most part, this course could be studied and understood in and by itself, without requiring constant allowance for

¹ See V. C (i) (b), pp. 23-35, above.

² In I. B (iv), vol. i, pp. 40-2, and I. C (i) (a), vol. i, pp. 52-63, above.

³ See Part I. B, vol. i, above.

the play of alien social forces. In this objective as well as subjective independence we found an important point of difference between civilizations, seen steadily and whole, and those fragments of civilizations called national states which our modern Western egotism has tried to erect into universes in themselves,¹ while our modern Western paganism has bowed down and worshipped them as idols.² In contrast to these fragmentary national units the bodies social of societies in process of civilization appear to have a genuine life of their own. This appearance has been borne out by our study of civilizations in their geneses³ and in their growths;⁴ and so far it has not been dispelled by our subsequent study of them in their breakdowns⁵ and disintegrations.⁶ For, although a disintegrating society may split into fragments, each one of these fragments turns out to be a chip of the old block. We have seen, for example, that even the External Proletariat is recruited (notwithstanding the name with which we have labelled it) from elements that are already within the disintegrating society's field of radiation—even though they may be only on its fringe.⁷ At the same time our survey of the several fractions of societies in disintegration—and this is true, not only of external proletariats, but of internal proletariats and dominant minorities as well—has frequently required us to take alien as well as indigenous actors into account in our efforts to follow the plot of the play. And this frequent call to extend our mental horizon beyond the limits of the particular society momentarily under view—even after allowing these limits their widest construction—in order to understand what is going on, is a definitely new and distinctive element that has entered into our Study at this stage of it.

The empirical survey which we have now just completed has, in fact, made it clear that, while the definition of a civilization as being 'an intelligible field of study' can be accepted virtually without qualification so long as the particular civilization that we are studying is still in growth, this definition can only be maintained with reservations when we come to the disintegration stage. True though it be that the breakdowns of civilizations are due to an inward loss of self-determination and not to any external blows,⁸ it is not true that the process of disintegration, through

¹ See Part I. A, vol. i, pp. 9-13, above.

² See IV. C (iii) (c) 2 (β), *passim*, in vol. iv, above.

³ See Part II, *passim*, in vols. i and ii, above.

⁴ See Part III, *passim*, in vol. iii, above.

⁵ See Part IV, *passim*, in vol. iv, above.

⁶ See Part V. A, B, and C (i) (c), 1-3, in the present volume, pp. 1-337, above.

⁷ See V. C (i) (c) 3, pp. 194-203, above.

⁸ See IV. C (iii) (a), vol. iv, pp. 119-33, above.

which a broken-down civilization has to pass on its way to dissolution, is equally intelligible without reference to external agencies and activities. In the study of the life of a civilization in the disintegration-stage the 'intelligible field' has proved to be distinctly wider than the ambit of the single society that is the immediate object of observation. And this means that, in the process of disintegrating, the substance of a body social does not merely tend to break up into its component elements but also tends at the same time—in consequence of this dislocation—to resume its liberty to enter into new combinations with extraneous elements derived from foreign bodies—just as the physical disintegration of a bar of iron is accompanied by an amalgamation of certain molecules of the metal, which the process of disintegration releases, with molecules of oxygen that are yielded up by the air. The formation of this oxide or rust, through a dislocation of the molecules of the disintegrating material and through the entry of an alien element into the chemical process, is, of course, the outward visible sign that the iron bar is weathering away; and in the disintegration of a body social the intrusion of alien social elements has a corresponding significance. It will be seen that, now that we have come to the study of the disintegrations of civilizations, we are finding that the ground on which we took our stand at the beginning of this Study is slipping away from under our feet. At the beginning we chose civilizations for the objects of our Study just because they presented the appearance of being 'intelligible fields' which lent themselves singly to being studied in isolation. We now find ourselves already on the move from this standpoint towards a different standpoint which we shall have to take up when we examine, in later Parts,¹ the contacts between one civilization and another—in the Space-dimension first and in the Time-dimension later. Meanwhile, in anticipation of this later systematic study of 'contacts' for their own sake, we may find it convenient at this point to distinguish and compare the respective effects of the alien and the indigenous inspirations that can be discerned in the activities of the several fractions of the body social of a civilization that is in process of disintegration.

Our survey has shown us that in the activities of all three fractions—the Dominant Minority as well as the two sections of the Proletariat—alien inspirations are apt to enter in. But if we now cast our minds back over the results of our survey, with our present purpose in view, we shall notice that the effects of these alien inspirations differ—and indeed are diametrically opposite to one another—in different cases, and that the difference

¹ In Parts IX and X, below.

of circumstance which produces the difference of effect is a difference in the identity of the party which is the recipient and exponent of the alien cultural influence. In the works of the Dominant Minority and the External Proletariat an alien inspiration is apt to result in discord and destruction, whereas in the works of the Internal Proletariat it is apt to produce the exactly opposite effects of harmony and creation.

To begin with the Dominant Minority, we may recall the fact—which has been brought out in our survey¹—that the majority of the universal states that are provided for disintegrating civilizations by their dominant minorities are the work of empire-builders who are indigenous to the society for which they are performing this social service. These indigenous empire-builders may be frontiersmen² from the outer edge of the world upon which they confer the blessing of peace through the imposition of political unity; but this origin does not, in itself, convict them of having any alien tinge in their culture.³ At the same time our survey has also brought to our notice certain cases in which the moral débâcle of a Dominant Minority has been so rapid and has gone to such lengths that, by the time when the disintegrating society has arrived at the natural term of its 'Time of Troubles', and is ripe for entering into a universal state, there is no longer any remnant of the original indigenous dominant minority that is still possessed of the empire-building virtues. In these rather rare cases the task of providing a disintegrating civilization with a universal state is not usually allowed to remain unperformed on account of the indigenous dominant minority's default. The usual denouement is for some alien empire-builder to step into the breach and to perform for the ailing society the service that ought to have been performed by native hands.⁴

We have now to observe that this involuntary acceptance of a universal state from an alien source is a practical confession of social bankruptcy, and that such a confession is seldom or never made with impunity. The alien empire-builder's little finger is apt to be thicker than the native empire-builder's loins.⁵ The outsider who intervenes in order to save a situation with which

¹ See V. C (i) (c) 1, pp. 52-5, above.

² See V. C (i) (c) 1, pp. 54-5, above. The stimulus of pressures to which the frontiersmen of a society are exposed, and from which, if they respond successfully to this challenge, they thereby shield—or starve—their neighbours of the same culture in the interior of the same world, has been examined in II. D (v), vol. ii, pp. 112-208, above. The misdirection—in the malady of Militarism—of the energies that are evoked by a successful response to the stimulus of pressures on a cultural frontier has been examined in IV. C (iii) (c) 3 (α), vol. iv, pp. 501-4, above.

³ See V. C (i) (c) 1, pp. 55-6, above.

⁴ See V. C (i) (c) 1, pp. 53-4, and V. C (i) (c) 2, pp. 88-95 and 105-17, above.

⁵ 1 Kings, xii. 10.

the indigenous dominant minority has shown itself incompetent to cope is naturally unwilling to undertake this arduous and ungrateful task 'for love'. He recoups himself for his pains in taking command of a desperate situation by charging an exorbitant fee; and since, *ex hypothesi*, he is in power, he can assess this charge at as high a figure as he likes and can exact the payment as harshly as he chooses. The beneficiary—or victim—of the alien empire-builder's high-handed service has precluded himself, in advance, from the possibility of insisting upon fair terms or reasonable accommodation. He has no choice, at the moment, but to pay whatever price may be extorted from him. But, of course, the less he is able to resist, the more bitterly he resents the necessity of submitting. Impotence is transmuted into vindictiveness; and the retaliation which is beyond the subject's power here and now is saved up for a future settlement of scores against a hated master, at compound interest.

This means that the universal peace which an alien empire-builder provides is never perfect—even in a prosaic worldly sense—because it is never able to grow out of being an external repression that depends for its efficacy upon a perpetual exertion of the physical force by which it was imposed in the first instance. This same crude physical force is, no doubt, the usual means by which any empire-builder—alien or indigenous—establishes his authority at the moment when he is actually founding his universal state; for the 'Time of Troubles', upon which the universal state supervenes, is in its essence an age of violence, and the final paroxysm of this frenzy is usually the worst.¹ Even the best-intentioned and highest-minded empire-builder can hardly be expected to do his business without behaving in the fashion of his age to some extent; and indeed this hardly avoidable initial recourse to violent means seldom provokes any deep resentment; for 'beggars cannot be choosers', and a society which has travelled so far along the path of disintegration as to have reached the culmination of its 'Time of Troubles' must, *ex hypothesi*, have been so cruelly buffeted and battered by the lawless play of force already that by this time, most likely, it will be prepared to acquiesce in one more bout of violence if, at this price, there is some hope of its being able at last to purchase admission into the haven of a genuine and enduring peace. On this account all universal states—whether their founders are natives or strangers—are apt to be accepted with resignation, if not with enthusiasm, at the outset; and it is only in the later chapters of the story that divergences begin to appear in the development of the relations between the rulers and

¹ For evidence of this see V. C (ii) (b), *passim*, in vol. vi, below.

their subjects. When these divergences do appear, however, they tend to be sharply marked.

In general we find that in a universal state which has been established by native hands—as the Hellenic universal state was established by the hands of the Roman frontiersmen of the Hellenic World¹—Time heals the wounds that the work of empire-building has inflicted, and transforms a submission extorted by force into an allegiance accorded by consent or even tendered with enthusiasm.

In the history of the Hellenic Society the Age of the Antonines—though this was but a brief 'Indian Summer' which might delay, but could not avert, the onset of the winter storms²—did at least achieve one notable permanent moral result in the conversion of the Greek Republic of Letters from a passive hostility and resentment³ to an active affection and gratitude towards the Roman Empire. The successors of Greek philosophers and rhetoricians who had still remained unreconciled to Roman rule in the time of the Emperor Domitian (*imperabat* A.D. 81–96), which was already more than a hundred years removed from the date of the original establishment of the *Pax Augusta* in 31 B.C. over the dead body of the last of the Greek Great Powers, were moved by the time of Marcus (*imperabat* A.D. 161–180) to return to the 'real life' of their day—from the asylum of an archaistic wonderland into which they had made their pedantic way through a literary looking-glass⁴—in order to add their cultivated Greek voices to a swelling chorus of praise with which Dea Roma was now being honoured, in all sincerity, by the loyal descendants of her formerly disaffected subjects. Let us listen for a moment to the voice of the Emperor Marcus's academic contemporary Publius Aelius Aristides, who knew how to express, in Greek that was both elegant and eloquent, the sentiments of millions of his British and Arabian and Pontic and Mauretanian fellow-subjects:

'You have made one single household of the entire Inhabited World. . . . Before the establishment of your empire the World was in confusion, upside down, adrift and out of control; but as soon as you Romans intervened the turmoils and factions ceased, and life and politics were illumined by the dawn of an era of universal order . . . so that to-day the Earth and all they that dwell therein are endowed with a clear and comprehensive security. . . .

'The entire Inhabited World now speaks with one voice in closer

¹ See II. D (v), vol. ii, pp. 161–4, above.

² See IV. C (ii) (b) 1, vol. iv, pp. 58–61, above.

³ See V. C (i) (c) 1, pp. 55–6, above.

⁴ See V. C (i) (d) 8 (γ), vol. vi, pp. 78–80, below.

unison than a chorus; and the common prayer which this oecumenical chorus utters is for the eternal duration of a Roman Empire which is kept in such masterly order by its emperor-conductor. . . . You Romans are the only rulers known to History who have reigned over freemen. . . . You have endowed the entire Inhabited World with the constitutional liberties of a world-wide city-state. . . . The lustre of your rule is unsullied by any breath of ungenerous hostility; and that is because you yourselves set the example of generosity by sharing all your power and privileges with your subjects . . . with the result that in your day a combination has been achieved which previously appeared quite impossible—the combination of consummate power with consummate benevolence. . . . No one is debarred from being a citizen of Rome either by an estranging sea or by an intervening continent. In this matter no distinction has been drawn between Europe and Asia. Every privilege of Roman citizenship lies within everyone's reach, and no one is treated as an alien who is worthy of responsibility and trust. In fact, the Roman Empire is a world-wide democracy under the governance of one supreme magistrate who is singled out for his pre-eminence in virtue; and Mankind comes together in a common forum where each can be sure of receiving fair measure. As an ordinary city-state stands to its own parochial territory, so stands this city of Rome to the entire Inhabited World. Rome is a town which has the World for its countryside. Rome is a citadel which has all the peoples of the Earth for its villagers. And Rome has never failed those who have looked to her. As the surface of the Earth bears all Mankind, so Rome receives all the peoples of the Earth into her bosom, as the rivers are received by the Sea. And this likeness of Rome to the Sea extends to a further point. The sea is not increased in volume by the inflow of the rivers. There seems to be some law of Nature which adjusts the Sea's capacity to the rivers' discharge. And it is the same with Rome: she does not run to any unseemly enormity, but . . . ever keeps and displays her own proper proportions.¹

This Greek panegyric of Rome from the second century of the Christian Era may be capped with the Latin testimony of two poets who were writing about a quarter of a millennium later than Aristeides, the one just before, and the other just after, the débâcle of A.D. 406–10,² and who came from the opposite extremities of the *Orbis Romanus*—the one from Egypt and the other from Gaul.

This is how Rome is addressed by Claudian of Alexandria in a Latin which was a *tour de force* in the mouth of a Greek citizen of the Roman Commonwealth:

Haec est, in gremium victos quae sola recepit,
humanumque genus communi nomine fovit

¹ Aristeides, P. Aelius: *In Romam*, pp. 396, 360, 362, 376, 373–4.

² Claudian's Third Book *De Consulatu Stilichonis* appears to have been written in A.D. 400, Rutilius's *De Reditu Suo* in A.D. 416.

matris, non dominae, ritu, civesque vocavit
quos domuit, nexuque pio longinqua revinxit.¹

And this is how she is addressed by the Gaul Rutilius in a Latin which was likewise an alien tongue in the mouth of a descendant of Celtic-speaking barbarians:

Fecisti patriam diversis gentibus unam:
profuit invitis, te dominante, capi;
dumque offers victis proprii consortia iuris,
Urbem fecisti quod prius Orbis erat.
auctores generis Venerem Martemque fatemur,
Aeneadum matrem Romulidumque patrem:
mitigat armatas victrix clementia vires;
convenit in mores numen utrumque tuos.
hinc tibi certandi bona parcendique voluptas:
quos timuit, superat; quos superavit, amat. . . .
te, dea, te celebrat Romanus ubique recessus,
pacificoque gerit libera colla iugo.
omnia perpetuo quae servant sidera motu
nullum viderunt pulchrius imperium.²

The Gallic poet who, in A.D. 416,³ made this famous declaration of admiration and love for a Rome that, six years earlier, had been smitten and humiliated by the hand of Alaric,⁴ had inherited the right to utter these ardent words; for he was descended from ancestors who had been brought under Roman rule by force of arms—and this, at the earliest, not very much more than five hundred years before the poet's own day.⁵ Rutilius was moved

¹ Claudian: *De Consulatu Stilichonis*, Book III, ll. 150-3.

² Rutilius Namatianus, C.: *De Reditu Suo*, Book I, ll. 63-72 and 79-82.

³ A.U.C. 1169 (Book I, ll. 135-6) = A.D. 416.

⁴ The memory of the *Clades Gothica* was still fresh in Rutilius's mind (ll. 39-42 and 115-44). For the impression which the news of the capture of Rome by Alaric had made, at the time, upon the minds of Saint Jerome and Saint Augustine, see V. C (i) (c) 3, pp. 223-5, above. Between Saint Jerome's letter on the subject, which has been quoted in V. C (i) (c) 3, p. 223, footnote 2, above, and the first four lines of the passage just quoted, in the present context, from Rutilius's poem, there is a twofold verbal correspondence. Saint Jerome's *capitur Urbs quae totum cepit Orbem* has recognizable echoes in Rutilius's *capit* and in his *Urbem-Orbis*. The chronological facts would allow us to account for these echoes by supposing that Rutilius had read and remembered Jerome's words; for Jerome's letter seems to have been written *circa* A.D. 412, while Rutilius tells us (see the preceding footnote) that the date of his poem is A.D. 416. But this chronological possibility is a psychological impossibility and an historical improbability; for Rutilius, as he also tells us in his poem, had a violent hatred for Christian anchorites and all their works; he would never have been willing to be consciously beholden to Saint Jerome for a phrase or an idea; and it is most unlikely that a letter addressed by Jerome, from Bethlehem, to a Christian correspondent should have come into Rutilius's hands during the Gallic poet's sojourn in Rome as *Praefectus Urbi* in A.D. 414, even if Jerome's correspondent Principia was still resident in Rome in A.D. 412. We must therefore assume that the figures of speech that are common to these two approximately contemporary pieces of Latin literature were commonplace which were 'in the air' in the second decade of the fifth century of the Christian Era. We can, indeed, already discern them in embryo in the passage, already ancient in Jerome's and Rutilius's day, which we have quoted above from Aelius Aristeides.

⁵ That is to say, if the poet's home (which he does not deign to mention precisely) lay in Gallia Narbonensis. If it lay beyond the Rhône and the Cevennes, somewhere

to write by the emotions that welled up within him as he travelled back to his Gallic home after a sojourn in the Imperial City. The feeling that chiefly inspired him was home-sickness; but the home that held his affection was the spiritual home that he was now leaving, and not the distant countryside that was his birthplace and habitual domicile.

At mea dilectis fortuna revellitur oris,
indigenamque suum Gallica rura vocant.¹

And his year's sojourn in the metropolis of his world has been all too short for his taste.

Velocem potius reditum mirabere, lector,
tam cito Romuleis posse carere bonis.
quid longum toto Romam venerantibus aevo?
nil unquam longumst quod sine fine placet.²

Nor is this surprising in Rutilius's case; for the business which had brought him on this long journey to the city that had forcibly imposed her yoke upon his forebears' necks was not the payment of a tribute or the performance of a *corvée* but was a call to investiture with one of the most distinguished offices of state—and this not some oecumenical magistracy which was concerned with the Empire as a whole, but the distinctively metropolitan *Praefectura Urbis*, which might well have been reserved—if any Roman public honour had been thus reserved in this age—for Roman citizens who had been born and bred within the precincts of the city. These happy beings were objects of the departing poet-prefect's wistful and respectful envy.

O quater et quotiens non est numerare beatos
nasci felici quo meruere solo!³

And his gratitude overflowed at the thought that he had been generously summoned from his own provincial birthplace in order to be co-opted into this goodly company.⁴ No wonder that, as he left the city of his dreams after having lingered there for more than twelve months beyond the end of his golden year of office, Rutilius had to shame himself into a faint blush of human

in that larger part of Gaul which had first been brought under Roman rule by Caesar, then Rutilius was a Roman *ressortissant* of less than five hundred years' hereditary standing. ¹ Book I, ll. 19–20. ² Book I, ll. 1–4. ³ Book I, ll. 5–6.

⁴ The list of those doubly-distinguished Prefects of the City who, unlike Rutilius, were of metropolitan origin, was not to close before it had included the future Pope Gregory the Great, who appears to have held the *Praefectura Urbis* in or about the year A.D. 573 (see III. C (ii) (b), vol. iii, p. 267, above), some 160 years after Rutilius, who appears to have held the office in A.D. 414. In Rutilius's own words (Book I, ll. 7–8) Gregory was one of those

Qui Romanorum procerum generosa propago
ingenitum cumulant Urbis honore decus.

feeling for his dull Gallic native land by reminding himself that her war-scarred countenance had a claim upon his pity.

Sed quam grata minus, tam miseranda magis.¹

In the lines² immediately following the first of the passages that have been quoted above, the poet goes on to throw into relief the greatness and goodness of the Roman Empire against a foil which he finds in the work of other empire-builders; and it is interesting to observe the uniformly alien origin of the examples that he picks out: the Assyrians who afflicted a Syriac World with a Babylonian reign of terror; the Medes who imposed a Syriac rule upon their Assyrian oppressors; the Macedonian *conquistadores* who won for Hellenism a dominion over the domain of a Syriac universal state that embraced the Egyptian and the Babylonian World as well as the Syriac; the Eurasian Nomad Parthians who usurped the heritage of the Achaemenids' Seleucid successors.

It was assuredly true that the Gallic poet's crowning eulogy of Rome—'Quod regnas minus est quam quod regnare mereris'³—would never have been uttered by any of these alien empire-builders' subjects—not even in the evening of their reign, when Time had done all that he could to temper the odiousness of their rule with the opiate of familiarity. The Babylonian priests who welcomed Alexander as a deliverer in 331 B.C. were more bitterly hostile to the Achaemenian régime than their predecessors had been two hundred and eight years back, when, in 539 B.C., they had seen the first Achaemenian conqueror, Cyrus, ride in.⁴ And their pent-up feelings burst out with all the greater violence because, for the past century and a half, they had been too heavily crushed to repeat the periodical armed revolts with which they had enlivened the first half-century of their subjection to an alien Syriac yoke. Alexander's reception by the Babylonians may remind an English scholar of the Hindus' acquiescence in the British Rāj in the early days when there was still a popular memory of the more obnoxious alien régime of the Mughals;⁵ and on this analogy we may conjecture that, if the Babylonian Civilization had not solved all its problems by the *ultima ratio* of becoming extinct in the last century B.C.,⁶ Hellenism

¹ Book I, l. 22.

² Book I, ll. 83-6.

³ Book I, l. 91.

⁴ See IV. C (ii) (b) 2, vol. iv, p. 100, footnote 4, and V. C (i) (c) 2, in the present volume, pp. 94 and 123, with footnote 2, above, and V. C (ii) (a), vol. vi, pp. 187-8, and V. C (ii) (a), Annex II, vol. vi, p. 442, below.

⁵ The Babylonians' attitude towards the Hellenic culture appears to have resembled the Hindus' attitude towards the Western culture. They readily adopted the externals, but were careful to keep the heart of their own culture intact (see Tarn, W. W.: *The Greeks in Bactria and India* (Cambridge 1938, University Press), pp. 56-60).

⁶ The latest document in the Akkadian language and cuneiform script that has yet been recovered by our modern Western archaeologists dates from 7 B.C. (Tarn, op. cit., p. 57).

might eventually have come to stink in Babylonian nostrils as odiously as the Western Civilization which is embodied in the British régime has actually come to stink in the nostrils of our latter-day Bengali revolutionaries. Certainly the alien *Pax Ottomanica* which had been welcomed in the first quarter of the fourteenth century of the Christian Era by the Greek adherents of the founder of the Ottoman Commonwealth on the Asiatic shores of the Marmara had become an object of loathing to the Greeks who rose in the Morea and in Rumili against the Government of Sultan Mahmūd II in A.D. 1821. In this case the passage of five centuries had produced in Greece a change of sentiment which was the exact inverse of the change in Gaul from the Romano-phobia of a Vercingetorix to the Romano-philia of a Rutilius Namatianus or a Sidonius Apollināris.

Another prominent example of the hatred that is aroused by empire-builders with an alien culture is the animosity of the Chinese towards the Mongol conquerors who provided a distracted Far Eastern World with a sorely needed universal state.¹

The vehemence of this Chinese feeling will impress us when we remind ourselves that the tincture of alien civilization which the Mongols had acquired² before they took it upon themselves to provide the Far East with a *Pax Mongolica* was far too slight to discolour more than infinitesimally the straightforward and inoffensive barbarism which was their native hue. Yet, faint though it was, this taint of discoloration never escaped the sharp sight of the Mongols' Chinese subjects and also never won pardon from their resentful hearts. To a distant observer's eyes the difference of tint between the fly-blown barbarism of the Mongols and the uncontaminated barbarism of the Manchus, who eventually re-established the Far Eastern universal state which the Mongols had originally founded, is so fine that it is barely perceptible, even under a scholar's lens. Yet this fine shade made a world of difference between the respective outcomes of the Mongol and the Manchu attempts at an identical enterprise.

The Mongols were expelled from China, neck and crop,³ only ninety-two years after Qubilai's capture of Hangchow;⁴ the Manchus were suffered to reign over China for the 267 years that elapsed between their entry into Peking in A.D. 1644 and the

¹ This has been touched upon by anticipation in Part V. A, pp. 3-4, and in V. C (i) (c) 1, p. 54, above.

² See II. D (vi), vol. ii, pp. 237-8; Part III. A, Annex II, vol. iii, p. 451; and V. C (i) (c) 3, in the present volume, p. 309, above.

³ See II. D (v), vol. ii, p. 121, above.

⁴ Hangchow capitulated to Qubilai's general Bayan in A.D. 1276; Qubilai's successor Tughān Timūr was driven out beyond the Great Wall in A.D. 1368.

Chinese Revolution which extinguished their effective authority in the same city in A.D. 1911. And, even then, the treatment which the discomfited Manchus received at Chinese hands was entirely different from that which had been meted out to their Mongol forerunners. The Mongols, with their indelible brand of uncleanness in Chinese eyes, had been physically expelled to the farther side of the Great Wall and had then and there resumed with ease—and possibly with relief—their great-grandfathers' nomadic life on their great-grandfathers' pasture-lands. The Sinitized epigoni of the Manchu conquerors who were put down from their seat in 1911 had by then long since lost all personal touch with their ancestral homes far away in the forests above the headwaters of the Sungari. And, if they had been returned, on disapproval, to this wilderness beyond the pale which was their historical place of origin, they would have been no more capable of resuming the pristine Manchu way of life than a butterfly is capable of resuming the life of a caterpillar. Marooned in the Manchurian forests, these latter-day Manchu princes and 'bannermen' would have perished as helplessly there as a Chinese litteratus or a Mongol new-born baby; and their former Chinese subjects, who had opposed them without animus and deposed them without vindictiveness, did not now expose them to this fate. They showed a nicer tact—and perhaps also a keener malice—in simply leaving them where they were, to sink unromantically, like lumps of lead, from the top to the bottom of the social scale of a Far Eastern Civilization that these *ci-devant* barbarians had embraced 'to have and to hold . . . for better for worse, for richer for poorer, in sickness and in health'.

This Chinese tolerance—at first respectful and finally contemptuous—towards the Manchus in the mandarins' midst presents a striking contrast to the violence of the antagonism which the Mongols, with their alien henchmen, excited in Chinese breasts from the beginning to the end of the Mongols' ill-starred attempt to play the part of the Imperial people in a Far Eastern universal state. That Chinese feeling is made manifest in two incidents which have been recorded by a Western Christian man of affairs who worked in China in the service of the Mongol Khāqān Qubilay. In the one case the targets of Chinese xenophobia were Orthodox Christian soldiers; in the other case they were Muslim administrators; but the temper of both Chinese out-breaks was the same.

The story of the encounter between Qubilay's Orthodox Christian soldiers and the Chinese civilian population of a Far Eastern World on which the Mongols were unable to impose their peace

without making a desert of it first¹ is recounted by Marco Polo as follows:

'At the time of the conquest of the great province of Manzi [the Empire of the Sung], when Bayan was in command, he sent a company of his troops, consisting of a people called Alans, who are Christians,² to take this city [of Changchow]. They took it accordingly; and, when they had made their way in, they lighted upon some good wine. Of this they drank until they were all drunk, and then they lay down and slept like so many swine. So, when night fell, the townspeople, seeing that they were all dead-drunk, fell upon them and slew them all; not a man escaped. And, when Bayan heard that the townspeople had thus treacherously slain his men, he sent another admiral of his with a great force, and stormed the city, and put the whole of the inhabitants to the sword.'³

The story of the anti-Muslim conspiracy is still more illuminating, since the feeling which it reveals is not the hot-blooded homicidal mania that breaks out where there is a state of war, but is a colder animosity which smoulders on in peace-time.

'A certain Saracen named Ahmad [from Banākath or Fanākant in Transoxania], a shrewd and able man, . . . had more power and influence with the Great Khan [Qubilai] than any of the others; and the Khan held him in such regard that he could do what he pleased. . . . In such authority did this man continue for two-and-twenty years. At last the people of the country, to wit the Cathayans [i.e., the Chinese], utterly wearied with the endless outrages and abominable iniquities which he perpetrated against them, . . . conspired to slay him and revolt against the Government. . . . [The principal conspirators, who were two Chinese military officers in Qubilai's service with commands at Peking,] sent word to their friends in many other cities that they had determined on such a day, at the signal given by a beacon, to massacre all the men with beards, and that the other cities should stand ready to do the like on seeing the signal fires. The reason why they spoke of massacring the bearded men was that the Cathayans naturally have no beard, whilst beards are worn by the Tatars, Saracens and Christians. And you should know that all the Cathayans detested the Great Khan's rule because he set over them governors who were Tatars, or still more frequently Saracens, and these they could not endure, for they were treated by them just like slaves. You see, the Great Khan had not

¹ 'Ubi solitudinem faciunt, pacem appellant.'—Tacitus: *Agricola*, chap. 30, *ad fin.*

² The Alans were a rear-guard of the Sarmatian Nomads who had lingered on in the borderland between the Great Western Bay of the Eurasian Steppe and the northern foot-hills of the Caucasus. Their conversion to Christianity in the eighth century of the Christian Era had been one of the earliest cultural conquests of a nascent Orthodox Christian Civilization; and the descendants of these converts had survived to be overtaken by the tidal wave of Mongol invasion in the thirteenth century, and to find their deaths, in the circumstances here described, at the opposite end of their new masters' immense dominions. (For the conversion of the Alans see I. C (i) (b), vol. i, p. 64, above.)—A. J. T.

³ Polo, Marco: *The Book of Ser Marco Polo*, translated and edited by Colonel Sir Henry Yule, 3rd edition (London 1903, John Murray, 2 vols.), vol. ii, pp. 178–9 = Book II, chap. 74.

succeeded to the dominion of Cathay by hereditary right, but held it by conquest; and thus, having no confidence in the natives, he put all authority into the hands of Tatars, Saracens or Christians who were attached to his household and devoted to his service, and were foreigners in Cathay.¹

The measure of the hostility which is evoked by alien authors of universal states—a hostility which is evidently only exacerbated, instead of being mitigated, by the passage of Time—is given by the uniformly fanatical *éthos* of the thoroughbred indigenous régimes which sometimes succeed in bringing such alien universal states to a premature end. This touch of fanaticism is shared by the Ming, who expelled the Mongols from China between A.D. 1351 and A.D. 1368,² with the Marāthās who were the ex-cutors of the Hindu Society's revenge upon the Mughals in the eighteenth century; and we can detect the same temper, not only in the anti-British revolutionary movement in twentieth-century Bengal, but also in the successive Babylonian revolts against Darius the Great and Xerxes, and in the Moreot Greek revolt against Ottoman rule in A.D. 1821.

A no less fanatical temper is apt to be evoked by barbarians with a tinge of alien culture when they present themselves in their normal role of predatory members of the External Proletariat without having gone out of their way to take upon themselves a Dominant Minority's neglected task of establishing a universal state. For example, the Hyksos, who broke into the domain of the Egyptiac Society after the break-up of the indigenous Egyptiac universal state that is known as 'the Middle Empire', were hated with as burning a hatred, and were expelled at the first opportunity, neck and crop, in as vehement a *Befreiungskrieg*,³ as the Mongol trespassers upon the sacred soil of China; and this similarity of the emotional reaction in two encounters which were so widely separated in Time as well as in Space is satisfactorily explained by the identity of the colour of the rag which in each case infuriated the bull. It was the alien Sumeric tinge in the culture of the Hyksos that made the Egyptians 'see red', as it was the alien Far Eastern Christian tinge in the culture of the Mongols that madened the Chinese. And in the Egyptiac case, as in the Far Eastern, our explanation is borne out by the contrast between this morbid fury and the common-sense stolidity with which the momentary maniac afterwards put up with a visitation from a second uninvited guest who was equally unwelcome in himself

¹ Ibid., vol. i, pp. 416-18=Book II, chap. 23.

² See II. D (v), vol. ii, pp. 121-2, and Part III. A, Annex II, vol. iii, p. 417, above.

³ See I. C (ii), vol. i, p. 139, footnote 1, and p. 144; IV. C (ii) (b) 2, vol. iv, p. 85; IV. C (iii) (c) 2 (β), vol. iv, p. 412; Part V. A, in the present volume, pp. 2-3; and V. C (i) (c) 2, p. 152, above.

but who happened to be innocent of the one offence that was unforgivable.

We have seen that the Far Eastern universal state which had originally been founded, with such explosive consequences, by the Mongols, was eventually re-established with impunity by Manchus whose sole, but decisive, point of diversity from their Mongol predecessors lay in the fact that their barbarism was free from any alien cultural taint. There is a parallel in Egyptiac history to this repetition-with-a-difference; ¹for, when the Egyptiac universal state had been re-established in the shape of 'the New Empire' by the Theban expeller of the Hyksos, Amosis, and when 'the new Empire', in its turn, was overtaken by the decadence into which 'the Middle Empire' had fallen in its day, two new barbarian clouds appeared, as we have seen, above the Egyptiac dominant minority's horizon. In the thirteenth and twelfth centuries B.C. a decaying Egyptian Empire was assaulted simultaneously by sea-peoples from the Aegean (the mingled destroyers and survivors of a broken-down Minoan 'thalassocracy') and by Libyan Nomads from the African side of the Afrasian Steppe; ²and in resisting the assailants of Minoan complexion the military emperors of the Nineteenth Dynasty and their immediate successor the second emperor of the Twentieth Dynasty, Ramses III, displayed the same energy as the formidable militarists of the Eighteenth Dynasty—Amosis himself or the first and the third Thothmes—in contrast to the unwarlike intervening reigns of the third and the fourth Amenhotep. ³In so far as the Libyans made common cause with the invaders from the Aegean in this age, both assailants were repelled with equal animosity, and also with equal success, by the pugnacious holders of the beleaguered Egyptiac fort. ⁴But an extraordinary change of temper came over Egyptiac souls after Ramses III, *circa* 1200/1190 B.C., had expended the last ounce of energy that remained in the Egyptiac body social on the task of stemming the last and greatest tidal wave of the post-Minoan Völkerwanderung. Thereafter, when the sea-peoples' offensive had been brought to a halt, once for all, at the Asiatic gates of Egypt between Pelusium and Gaza, the Libyan barbarians from beyond the North-West African frontier of the Egyptiac World found themselves knocking at an open

¹ This parallel has been mentioned, by anticipation, in IV. C (iii) (c) 2 (β), vol. iv, pp. 421–3, above.

² See I. C (i) (b), vol. i, p. 93, and V. C (i) (c) 3, in the present volume, pp. 236–7 and 269–70, above.

³ Amenhotep IV is, of course, identical with the Imperial heretic Ikhnaton.

⁴ See I. C (i) (b), vol. i, pp. 93 and 101; IV. C (ii) (b) 2, vol. iv, p. 85; IV. C (iii) (c) 2 (β), vol. iv, p. 422; and V. C (i) (c) 3, in the present volume, pp. 237 and 269, above; and V. C (ii) (a), vol. vi, p. 207, below.

door as soon as they sought admission by, as well as for, themselves, without any obnoxious confederates from the Aegean to cast doubt upon the Libyans' own clean bill of social health as untainted barbarians.

During the period of social prostration which followed the death of Ramses III (*imperabat circa 1200-1168 B.C.*),¹ the *rois fainéants* who make up the rest of the tale of the Twentieth Egyptian Dynasty allowed the descendants of the Libyan aggressors, who had repeatedly been hurled back by these shadow-emperors' predecessors, to encroach upon the sacred soil of the Egyptian World step by step—with no single step ever effectively opposed—in the role of brigands and mercenaries. And by the tenth century B.C. we find these impudent Libyan intruders in command of all the provinces that had not been reserved by the Egyptian priesthood for the benefit of their own new-fangled temple-states.² These sacerdotal legatees of the Egyptian dominant minority and internal proletariat were evidently at this date in virtual collusion with the external proletariat's Libyan representatives; and at first sight it seems extraordinary that this Libyan barbarism should have been tolerated, at these close quarters, by a fanatically-minded hierarchy which had shown itself uniformly intransigent towards the Philistines as well as towards the Hyksos. On second thoughts, however, we may conjecture that the Libyan interlopers' unmitigated barbarism was the quality which commended them to the complacent proprietors of the domain on which they were now unobtrusively trespassing. To the professional eye of trustees of the Egyptian tradition who were capable of taking a long view, these shapeless plastic lumps of Libyan clay were less disconcerting than those rudimentary Philistine and Hyksos figurines which had begun to set hard in an alien mould before ever they were thrown upon an Egyptian potter's wheel.

A similar preference for the raw over the 'semi-manufactured' barbarian made itself manifest in the Syriac World during the interregnum (*durabat circa A.D. 975-1275*) which was the final

¹ See I. C (i) (b), vol. i, p. 101, above.

² See IV. C (iii) (c) 2 (β), vol. iv, p. 422, footnote 3, and V. C (i) (c) 3, in the present volume, pp. 269-70, above. The process is described as follows by Meyer, E.: *Geschichte des Altertums*, vol. ii, part (1), second edition (Stuttgart and Berlin 1928, Cotta), p. 589: '[After their defeat at the hands of Ramses III] the Libyan tribes did not ever attempt any further invasions [of the Egyptian World], so far as we know; but their peaceful dissemination over Egypt (a process which was promoted by Ramses' settlements [of Libyan prisoners of war on Egyptian soil]) went forward all the more vigorously for that. At the same time the [Egyptian] army drew on the Libyans more and more heavily for recruits. . . . As, at the same time, the enlistment of mercenaries from overseas [i.e. from the Minoan World] entirely came to an end after Ramses III's day, and the military vigour of the [native] Egyptians died away to vanishing point, these Libyan troops gradually became the only militarily effective portion of the Egyptian army. The consequence was that, two hundred years later, under Shoshenq I, these Libyans who had been Egypt's serfs converted themselves into Egypt's masters.'

chapter in its long history. Of all the barbarians who, in this age, fell upon the Syriac Society's moribund carcass, the Franks were perhaps the least barbarous. They were, indeed, the children of an adolescent Western Christian Civilization which had already begun to develop a distinctive culture of its own; and—perhaps just on this account—they were invariably rejected by the *Plebs Syriaca* in favour of alternative barbarian masters, wherever and whenever there was a choice. In the derelict domain of the Andalusian Umayyad Caliphate in the Iberian Peninsula the victimized provincials put their necks under the successive yokes of the Murābit Sanhāja Berber Nomads,¹ who were as barbarous in fact as in name, and of the Muwahhid Masmuda Berber highlanders,² who out-berbered the Murābits, rather than submit to the dominion of the Basque and Asturian Christian barbarians with their reinforcements from the French side of the Pyrenees.³ In the derelict domain of the 'Abbasid Caliphate in Syria the provincials who had been conquered by the Frankish founders of the Crusader principalities⁴ made a corresponding choice when they welcomed as deliverers the Turkish and Kurdish barbarian war-bands⁵ of Zengi and Nūr-ad-Din and Shīrkūh and Saladin.

We can perhaps even venture to formulate something like a general social 'law' to the effect that the barbarian invaders who present themselves free from any cultural taint are apt to make their fortunes—and this even if they persist in their barbarian paganism instead of abandoning it in favour of the orthodox religion of their newly conquered subjects—while those who, before their Völkerwanderung, have acquired either an alien or a heretical tinge must go out of their way to purge themselves of the unclean thing, through some positive act of conversion which their subjects will accept as satisfactory, if they are to escape an otherwise inevitable doom of being either ejected or exterminated.⁶

To take the undiluted barbarians first, we may remind ourselves

³ See II. D (v), vol. ii, pp. 204-6, and V. C (i) (c) 3, in the present volume, pp. 242-4, above.

⁴ For the Crusades see I. B (iv), vol. i, p. 38; II. D (vii), vol. ii, pp. 362-3; and V. C (i) (c) 3, in the present volume, pp. 242-4 and 247, above.

⁵ The Kurdish, unlike the Turkish, warriors who supplied the man-power for this counter-offensive were not in the strict sense members of the external proletariat of the Syriac World. They were an imperfectly tamed highland community in the heart of the Syriac World—who like the Ghūri highlanders of North-Eastern Iran (see IV. C (i) (b) 2, vol. iv, p. 99, footnote 1, and V. C (i) (c) 3, in the present volume, p. 304, above)—had reasserted their barbarian independence upon the downfall of the 'Abbasid Caliphate, as the Isaurians and the Basques had reasserted theirs upon the downfall of the Roman Empire (see V. C (i) (c) 3, p. 206, footnote 1, above).

⁶ This 'law' that can be seen at work in the diversity of the fortunes of barbarian conquerors is a particular application of a still wider 'law' which Ibn Khaldūn has brought to light in the field of the arts and sciences (*Muqaddamāt*, de Slane's translation (Paris 1863-8, Imprimerie Impériale, 3 vols.), vol. ii, pp. 366-7: chapter headed: 'He

that the Aryas and the Hittites and the Achaeans, who each invented a barbarian pantheon of their own during their sojourn on the threshold of a civilization,¹ and who persisted in this authentic barbarian worship after they had broken through and made their conquests, each also succeeded, notwithstanding this 'invincible ignorance', in becoming the fathers of new civilizations: the Indic, the Hittite, and the Hellenic. As for the Kassites and the Parthians, who made a half-hearted and ineffective compromise between the religion which they had brought in with them and the religion which they found in the conquered land, even they were rewarded for their innocence of any alien cultural taint² by being suffered to enjoy a parasitic dominion which was as protracted as it was inglorious, before the society upon which they had billeted themselves lost patience at last and spued out of her mouth these lukewarm Laodiceans.³ When we pass on to the undiluted barbarians who have been converted whole-heartedly from their own barbarian religion to the orthodox faith of their subjects—whatever that faith may have been in any given case⁴—we find that these robust converts have won the signal reward of being co-opted into the fellowship of a civilization which has not owed its origin to their endeavours, and which might, if it had chosen, have gone on its own way without accepting their services.

For example, the Frankish and English and Scandinavian and Polish and Magyar converts from a native paganism to the Western Catholic Christianity secured the opportunity to play a full, and even a leading, part in the building up of Western Christendom. The conversion of the Sakas and the White Huns and the Gurjaras to Hinduism enabled the Sakas to contribute to the foundation of a Hindu universal church in the course of the who possesses the capacity for practising some particular art very rarely manages to acquire another art perfectly):

'A tailor, for instance, who possesses a capacity for sewing, who uses it with the greatest skill, who is really master of his art, and who has made it part and parcel of himself, will be unable afterwards to acquire, to perfection, the art of being a cabinet-maker or a mason. If he did achieve this, that would mean that he did not yet possess, to perfection, the former capacity; it would mean that the dye of that capacity in him had not yet taken fast. Here is the explanation: it is that the capacities—being attributes of the Soul or colours which the Soul is apt to take—cannot overlay one another on the Soul and can only settle on the Soul one at a time. In order to acquire a capacity easily, and to be in a favourable condition for the reception of it, the Soul must be in the primitive state of its nature. Afterwards, when it takes the colour of this or that capacity, it departs from its primitive state; and, since the tincture which has now just been imparted to it is bound to have weakened in the Soul its aptitude for receiving another tincture, the Soul no longer has as much strength as before for acquiring a second faculty.'

¹ See I. C (i) (b), vol. i, pp. 96-7; II. D (vii), Annex V, vol. ii, pp. 434-7; and V. C (i) (c) 2, in the present volume, pp. 230-3, above.

² The Philhellenism of the Parthians was so superficial that it can hardly have counted among the offences for which the Parthians were eventually condemned and executed by the Syriac 'Zealots' of the Zoroastrian persuasion (see V. C (i) (c) 3, pp. 216 and 240, above).

³ Rev. iii. 16.

first four centuries of the Christian Era,¹ and the Huns and Gurjaras to play, in the first chapter of the history of the resulting Hindu Civilization, the part which was played in the first chapter of our Western history by the Franks.² Similarly, the conversion to Buddhism of the Kushans when they crossed the Hindu Kush,³ and of the To Pa when they established themselves in Shansi,⁴ conferred upon the Kushans the privilege of serving to speed a nascent Mahāyāna on its way across the Oxus from India to the Far East,⁵ while the subsequent acceptance of the full-blown Catholic Mahāyāna by the To Pa singled out these hitherto obscure Eurasian Nomads to enjoy the honour of laying the foundations for the Far Eastern United Kingdom of the Sui and the T'ang.⁶ In the post-Syriac interregnum the conversion of the Saljūqs on the one side and the Murābits and Muwāhids on the other to the Sunnah⁷ cast these Turks and Berbers for the roles that were played in the post-Hellenic interregnum by the Franks and the English and in the post-Indic interregnum by the Huns and the Gurjaras.⁸ In the disintegration of the main body of Orthodox Christendom we can see that the Serb barbarians, who were converted to Orthodox Christianity,⁹ found a wider field—

¹ See V. C (i) (c) 3, Annex II, pp. 605-6, below.

² The evidence for the Hun and Gurjara origin of the Rājputs, who were the ruling element in the Hindu World from the emergence of the Hindu Civilization in the eighth century of the Christian Era until its breakdown in the twelfth, is set out in Smith, V. A.: *The Early History of India*, 3rd edition (Oxford 1914, Clarendon Press), pp. 407-15. The crucial act in the metamorphosis of the Eurasian Nomad raider into the Rājput paladin seems to have been his conversion to Hinduism.

⁶ The To Pa barbarian 'successor-state' of the Han Empire in Shansi blossomed out, after its conversion to the Catholic Mahāyāna, into the Kingdom of the United Wei (*floruit circa* A.D. 420-534), which absorbed into itself two sister barbarian 'successor-states', Pe Han and Pe Yen (see V. C (i) (d) 6 (α), p. 477, below), besides momentarily subduing the unreclaimed Nomads in its own rear on the Steppe (for this latter feat see V. C (i) (c) 3, p. 273, above; for the Sinification of the To Pa themselves by one of the princes of the United Wei, Hiao-wên ti (*regnabat* A.D. 490-9), see V. C (i) (d) 6 (α), pp. 477-8, below). After half a century of renewed division—this time into two fractions (the Eastern Wei with their successors the Pe Ts'i (*durabant* A.D. 534-77) and the Western Wei with their successors the Pe Chōu (*durabant* A.D. 535-77)—the former dominions of the United Wei were reunited through the Pe Chōu conquering the Pe Ts'i (A.D. 577). The Pe Chōu only enjoyed the fruits of this victory for four years before being supplanted (in A.D. 581) by the new dynasty of the Sui; but this dynastic change not only left the work of consolidation unimpaired but also quickly resulted in its completion; for in A.D. 589 the Sui reunited the South of the Far Eastern World with the North under a single sovereignty, and this put an end to a separation between South and North which had lasted, in all, for 272 years since the fall of the United Ts'in in A.D. 317. After this it only remained for the T'ang to enter into the labours of the Sui, as once, in the history of the appparent Sinic Civilization, the Han had entered into the labours of Ts'in She Hwang-ti.

and this for more effective action—than their kinsmen and neighbours the Bosniaks, who were converted to the heresy of Bogomilism.¹ Finally, we may observe that the Aztecs—who were on the point of imposing their own grim peace upon a distracted Mexic World when the Spaniards suddenly burst in and wrested out of the Aztecs' hands the role of serving as the empire-builders of a Central American universal state—were undilutedly barbarian interlopers² who had embraced, apparently without reserve, the religion which the Mexic Society had inherited from its Mayan predecessor.³

If we now survey the barbarians who have yielded, like the Bosniaks, to the attractions of an alien or a heretical faith, we shall observe that the Bosniaks themselves are in a category of barbarian heretics that have elected to save themselves alive by capitulating to the prevailing orthodoxy before it has been too late. The Bosniaks prudently exchanged their invidious Bogomilism for the Sunnī Islam which was the religion of the alien Ottoman founders of an Orthodox Christian universal state.⁴ The Burgundians and Visigoths and Lombards exchanged their Arianism for the Catholicism of their subjects. And the Mongol Il-Khans of Iran and 'Irāq, after toying with both Nestorianism⁵ and the Shī'ah,⁶ had the wisdom in the end to opt for a Sunnah⁷ which in their days was the faith of the vast majority of the population in the territories over which the Il-Khans' rule extended.

The statesmanship of these barbarian apostates is commended by the spectacle of the untoward fate of their comrades who hardened their hearts; for if 'Paris is worth a mass', it is presumably to be allowed, *a fortiori*, that any apostasy is justified, on Machiavellian standards, when the alternative to it is eviction or extermination; and one or other of these unpleasant experiences seems to have overtaken every one of the heretical barbarian warbands that have insisted upon making themselves unnecessarily odious to their subjects by perversely persisting in the error of their religious ways. The Hyksos worshippers of Set were evicted from the Egyptiac World by Amosis.⁸ The Ostrogoth Arians were

evicted from Italy, and the Vandal Arians exterminated in Africa, by Justinian. The Mongols, with their Nestorian Christian taint and their Tantric Mahayanian Buddhist proclivities, were evicted from China by the Ming.¹ The Katāma and Daylamī and East-Arabian Shi'ites, whose Fātimid and Buwayhid and Carmathian leaders seemed destined for a moment to divide between them the heritage of the Sunnī 'Abbasid Caliphate, were all brought to naught at the moment when the prize seemed to be within their grasp. The Buwayhids were supplanted by the Saljūqs; the Fātimids were deposed by Saladin; the Carmathians were hurled back from the borders of 'Irāq and Syria and were left to die of inanition in the deserts in which they had made their lair.² Finally we may notice that the Far Western Christians of 'the Celtic Fringe', who obstinately clung to their own peculiar usages, were absorbed into the body social of Roman Christendom by a process of subjugation, instead of being taken into partnership on equal terms like the Scandinavians. The Scandinavians were no more successful than the Far Western Christians were in their attempt to erect a promising barbarism into an independent civilization in face of the Roman Christendom with which they had collided; but, in the terms of their capitulation to a victorious Roman Christendom, they profited conspicuously, by contrast with the Celts, from the facts that they passed straight out of a native barbarian religion into the Roman form of Christianity and that they made this change through a voluntary act of conversion.³

The outstanding exception to this particular clause of our 'law' is presented by the history of the Primitive Muslim Arab external proletariat of the Roman Empire, who succeeded in making their fortunes—and this with an unparalleled brilliance—notwithstanding their obstinacy in clinging to their barbarian version (or travesty) of Syriac religion⁴ instead of abandoning Islam for the Monophysite Christianity of their new subjects in the conquered Roman provinces of Syria and Egypt. This is, however, one of those exceptions which do not discredit a rule but rather confirm it; for we have noticed, in other contexts,⁵ that

⁵ In I. C (i) (b), vol. i, pp. 72-7; II. D (vi), vol. ii, p. 235; II. D (vii), vol. ii, pp. 285-8; and V. C (i) (c) 2, in the present volume, pp. 128-9, above. See further V. C (i) (d) 6 (b), Annex, pp. 672-7, below.

the Muslim Arab barbarian conquerors of these Roman provinces had a subsequent career which was utterly different from that of their Berber and North European and Eurasian Nomad companions-in-arms who broke through the frontiers of the same empire on other fronts. Through the Arabs' incidental conquest of the entire Sasanian Empire, in the course of their victorious assault upon the Oriental provinces of the Roman Empire, the barbarian 'successor-state' of the Roman Empire which the Arabs had founded on Syrian soil transformed itself into a restoration of the Syriac universal state which had been prematurely destroyed, a thousand years before, when the Achaemenidae had been overthrown by Alexander; and the vast new political mission with which the Muslim Arab conquerors were thus, almost accidentally, invested, opened up a new horizon for Islam itself. Alone among barbarian heresies, the Arab prophet Muhammad's amalgam of Christianity and Judaism escaped the scrap-heap which is the usual destination of such crude barbarian blacksmith's work. Under the normal operation of our rule the Arab war-bands that settled upon Syria and Egypt in the seventh century of the Christian Era ought either to have abandoned their Muhammadan heresy or to have been cast out again into their native Arabian steppes before the close of the eighth century. In the actual event the year 800 saw the Arabs politically firm in the saddle through the length and breadth of the Syriac World from Andalusia to Farghānā; and by the same date Islam, so far from being extinct, had already turned into a 'higher religion' with a 'manifest destiny' to provide the Syriac internal proletariat with its long-sought universal church.¹

It will be seen that this history of Islam is a special case which does not invalidate the general results of our inquiry.² In general we are evidently justified in concluding from an empirical survey that, for external proletariats and for dominant minorities alike, an alien inspiration is a curse, because it is a fruitful source of friction and frustration for either of them in their dealings with members of the other two fractions of the three into which a disintegrating society splits up. If we turn now to examine the influence of alien inspirations upon the lives and fortunes of internal proletariats, a survey of the field in this case will lead to a conclusion which is exactly the opposite. For internal proletariats we shall find that an alien inspiration, so far from being a curse, is a blessing which confers upon those who receive it an apparently

¹ See II. D (vii), vol. ii, p. 288, above, and V. C (i) (d) 6 (δ), Annex, pp. 677-8, below.

² The history of Islam is also a special case in respect of another social 'law' to the effect that religions bring ruin on themselves by going into politics (see V. C (i) (d) 6 (δ), Annex, pp. 672-8, below).

superhuman power of taking their conquerors captive¹ and of attaining the end to which they have been born.² And if we hesitate on first thoughts to accept this conclusion, because we can see no reason why an identic cause should have these diametrically opposite effects when it is acting upon different fractions of the same body social,³ we must be content in the first instance to verify the fact in the hope that it may begin to explain itself as we study it at closer range and in greater detail. Our thesis can best be tested by an examination of those 'higher religions' and universal churches which are the Internal Proletariat's characteristic works; and our survey of these has shown that their potency depends upon the presence, and varies in proportion to the strength, of an alien spark of vitality in their spirit.⁴

This alien spark is visible in most of the 'higher religions' which we have identified in an earlier chapter;⁵ for a 'higher religion' usually turns out to have originated in some section of the Internal Proletariat that has at any rate been profoundly influenced by some alien culture, even if it has not actually been recruited from a population which has been forcibly detached and transferred from some alien body social by an act of conquest on the Dominant Minority's part.

For example the worship of Osiris, which was the 'higher religion' of the Egyptiac proletariat, can be traced back tentatively (as we have seen)⁶ to an alien origin in the Sumeric worship of Tamimuz; and the manifold and competing 'higher religions' of the Hellenic internal proletariat can all be traced back to various alien origins with certainty. In the worship of Isis the alien spark

¹ Horace, *Epp.*, Book II, Ep. i, l. 156.

² John xviii. 37.

³ The question why, for the Internal Proletariat, an alien inspiration is a social 'asset', instead of being the social 'liability' that it is for the External Proletariat and for the Dominant Minority, must, of course, be kept distinct from the different question why, for the Proletariat of both kinds, an alien inspiration is attractive. The answer to this second question is obvious. The Proletariat is drawn towards alien elements of culture for the negative reason that these have no associations with a Dominant Minority against whose domination the Proletariat is in revolt. In the case of the External Proletariat we have come across this motive already in observing the External Proletariat's proneness, even when it accepts a 'higher religion' from the Dominant Minority's side of the *lines*, to take this 'higher religion' in some heretical form (see V. C (i) (c) 3, pp. 227-30 (Arianism, Celtic Christianity, Islam), pp. 250-2 (Manichaeism, Nestorianism, the Shi'ah), pp. 295-6 (Bogomilism, Bektashism, Wahhabism, Idrisism), pp. 309-10 (Tantric Mahayanian Buddhism), pp. 328-32 (the North American Indian prophetic religions)). Some of the corresponding considerations in the mind of the Internal Proletariat are brought out in the following note by Professor Gilbert Murray:

'The Proletariat (1) craves an imaginary world, or world of faith, to compensate the real world in which all God's chillen obviously have not got wings—or shoes; and (2) feels sure that, whatever the truth is, it cannot be what their masters know or believe (as the English labourer knows that it cannot be the Squire's "Church of England", or the factory hand that it cannot be the Employer's "Liberalism"). Therefore anything from a foreign source is welcome.'

⁴ See I. B (iv), vol. i, pp. 40-1; I. C (i) (a), vol. i, p. 57; II. D (vi), vol. ii, pp. 213-16; and V. C (i) (c) 2, in the present volume, *passim*, above.

⁵ In V. C (i) (c) 2, *passim*, above.

⁶ In V. C (i) (c) 2, pp. 147-50, above.

is Egyptian; in the worship of Cybele it is Hittite; in Christianity and Mithraism it is Syriac; in the Mahāyāna it is Indic; and in each of these cases we are acquainted with the historical circumstances in which the vital fire was introduced into the Hellenic tinder. The first four of the 'higher religions' in this Hellenic list were created by Egyptian and Hittite and Syriac populations which had been conscripted into the Hellenic internal proletariat through Alexander's conquest of the Achaemenian Empire in and after the year 334 B.C., while the fifth—namely the Mahāyāna—was created by an Indic population which had been likewise conscripted into the Hellenic internal proletariat, in and after the second decade of the second century B.C. through the Euthydemid Bactrian Greek princes' conquests in the Indic World.¹

Profoundly though they may differ from one another in their inward spiritual essence, all these five 'higher religions' have at least this superficial feature in common. They are all of them attempts to translate some non-Hellenic religious inspiration into Hellenic terms—devotional or philosophic or aesthetic.² In the first four of them this feature is notorious; but it is also unmistakably recognizable in the Mahāyāna. One of the decisive steps towards the creation of a 'higher religion' out of the philosophy of Siddhārtha Gautama was taken when Buddhist sculptors made use of the plastic medium of representation, which the intrusive Hellenic culture had placed in their hands, in order to portray the Buddha in concrete anthropomorphic form.³

This visualization of the Buddha as a being of the Apollinean Hellenic type was attained by a utilization of Hellenic technique on Indic soil, before the nascent 'higher religion' had begun to spread beyond the bounds of the society that had given it birth. But the Buddha who had been clothed in this Hellenic body—a body of cold marble and not of flesh and blood—had only been invested with the bare externals of divine personality. The would-be worshipper had still to discover the living god within the lifeless statue; and this act of intuition was not achieved until, in the next chapter of the story, the statue itself had been spiritualized by an Indic chisel,⁴ and, in the next chapter after that, the

¹ See I. C (i) (b), vol. i, p. 86; II. D (v), vol. ii, p. 143; V. C (i) (c) 2, in the present volume, p. 133, with footnote 1, and p. 139; and V. C (i) (c) 3, pp. 275-6, above.

² On this point see further pp. 366-7, below.

³ See III. C (ii) (a), vol. iii, p. 247, footnote 2, and V. C (i) (c) 2, in the present volume, p. 134, above.

⁴ The Apollinean type of Buddha statue, which seems to have been the creation of Greek artists working in Gandhāra near the beginning of the last century B.C. at the latest, was discarded, in favour of a more spiritual type, by an Indic school of artists working at Mathurā after the beginning of the second century of the Christian Era, at the earliest (see Tarn, W. W.: *The Greeks in Bactria and India* (Cambridge 1938, University Press), pp. 396-408).

ci-devant Indic philosophy, with its mantle of thus Indicized Hellenic art, had been propagated from the Indic into the Syriac provinces of the Bactrian Greek Empire's Kushan 'successor-state'.¹ In the Oxus-Jaxartes Basin under the Kushan régime Buddhism underwent a further translation—this time on the devotional plane—into terms of the other alien culture which it encountered here. On this Syriac ground the Indic philosopher portrayed as an Indicized Olympian god was transfigured, to all appearance, into a Zoroastrian saviour;² and it was this second mutation that completed the metamorphosis of Gautama's philosophy into the religion of the Mahāyāna. Thus the Mahāyāna was miraculously born from an Olympian's head and was then still more miraculously brought to life like Pygmalion's statue. And, if, in the next chapter after that, the new religion had travelled westwards in order to compete with its four sisters for spiritual supremacy in the Hellenic World, the Mahāyāna would have presented itself to its Hellenic converts as a Hellenized proletarian-born 'higher religion' with a twofold alien inspiration—part Indic and part Syriac.

In this Indo-Syriac duality the Mahāyāna would not have been an altogether peculiar portent in the spiritual landscape of the Roman Empire, for it would have had a counterpart in Mithraism, which—with its strong infusion of the Babylonian astral philosophy³—might be regarded as a dual Syro-Babylonian rather than as a simple Syriac graft upon a Hellenic stem. As it happened, however, the direction in which the Mahāyāna travelled from its temporary camping-ground on the banks of the Oxus was not westward but eastward.⁴ Under the Kushan régime, as we have observed, it spread from the Oxus-Jaxartes Basin to the Tarim Basin in the age when the two were politically united in the Kushan Empire; and from the Tarim Basin—which was a province of the Sinic universal state again after, as it had already been before, the interlude of the Kushan occupation—the Mahāyāna travelled on to conquer a vast new spiritual empire in the Sinic World.⁵

¹ See V. C (i) (c) 2, pp. 139-40, above.

² See V. C (i) (c) 2, p. 136, above. This transfiguration did not, of course, take the form of a direct deification of the historical human figure of Siddhārtha Gautama the Sakya aristocrat from Kapilavastu. When the man Gautama had come to be regarded as an epiphany of Buddhahood, it was a natural, and perhaps inevitable, step for a religion of Indic origin to assume that this epiphany was a term in a series. The new step was to expand the series by an exercise of the devotional imagination. And it was the mythical epiphanies—an Avalokita and a Maitreya and an Amitābha (Amida)—that became the saviour-gods of the Mahāyāna. (For the cult of Amitābha see V. C (i) (d) 11, vol. vi, p. 164, footnote 3, below. For the Japanese adaptation of this cult see V. C (i) (c) 2, in the present volume, pp. 96-103, above.)

⁵ See V. C (i) (c) 2, pp. 143-5, above.

The victory of the Mahāyāna in the Far East is a triumph which is comparable in magnitude to the victory of Christianity in the Near East and the West; and the irresistible inference is that an alien inspiration cannot be a source of friction and frustration when the party that is fired by it is an internal proletariat and not either an external proletariat or a dominant minority. The Christian religion of the Hellenic internal proletariat was not debarred by its Syriac 'taint' from conquering the Hellenic World; and the Mahāyāna conquered the Sinic World in spite of being saturated with an alien 'taint' that was neither single nor even dual but actually triple—for in Sinic eyes the Indic and the Hellenic and the Syriac elements in the Mahāyāna were all equally exotic; and the Hellenic style of the Mahayanian Buddhist art, which would have served the Mahāyāna as a passport for admission if it had been knocking at the gates of Antioch or Rome, only emphasized its outlandishness in the sight of citizens of Ch'ang Ngan and Loyang. Nevertheless the Mahāyāna triumphantly made its conquest of the outgoing Sinic Civilization and successfully impressed upon the incoming Far Eastern Civilization an imprint of Hellenic art and Syriac devotion and Indic philosophy, though these traits were all decidedly alien from the *êthos* of the apparented Sinic Society to which this nascent Far Eastern Society was affiliated. These indisputable historical facts would appear to suggest that for an internal proletariat an alien 'taint' is no handicap, but is rather a positive advantage. For, while it might perhaps be arguable (though the argument would be a *tour de force*) that Christianity conquered Hellenism in spite, and not because, of the conquering religion's non-Hellenic spark of Syriac inspiration, it would be almost beyond belief that, if alienness were really a hindrance and not a help to the spread of a 'higher religion', the Mahāyāna could ever have conquered the conservative-minded latter-day Sinic World under the crippling handicap of being alien three times over.

Our conclusion will not be shaken by a consideration of certain cases in which an attempt to conquer a society has been made by an alien 'higher religion' without success. There is the abortive attempt of the Shi'ah to become the universal church of the main body of Orthodox Christendom under the Ottoman régime;¹ and

¹ See I. C (i) (b), Annex I, vol. i, pp. 382-3, and V. C (i) (c) 2, in the present volume, p. xii, above. The process through which the Shi'ah introduced itself into the internal proletariat of the main body of Orthodox Christendom resembles the process by which the Mahāyāna introduced itself into the internal proletariat of the Sinic Society. In this case, as in that, the intrusive religion was able to make its entry owing to the vicissitudes in the history of a border province in which it had gained a foothold. In the case of the Mahāyāna this border province was, as we have seen, the Tarim Basin: an outlying annex of the Indic World which was conquered for the Sinic World by the Prior Han; reconquered for the Indic World (and for the Syriac and Hellenic worlds as well)

the abortive attempt of Catholic Christianity to become the universal church of the Far Eastern Society—in China during the last century of the Ming and the first century of the Manchu régime, and in Japan at the moment of transition from the Japanese 'Time of Troubles' to the Tokugawa Shogunate. Again, the role which has been played by Catholicism in the Far East and by the Shi'ah in the main body of Orthodox Christendom has been played in the Russian Orthodox Christendom, *post Petrum*, by the Protestant variety of Western Christianity. In each of these cases the intrusive 'higher religion' has failed to make its conquest, in spite of the alienness of its origin; but in each case the failure has a convincing explanation which has nothing to do with the question whether the inspiration of the successful religion has been alien or indigenous.

In Russia, for example, Protestantism has been driven off the field in our day by the competition of a rival movement of the same alien origin: the Marxian philosophy. At the time of going to press in A.D. 1938 the triumph of Marxism in Russia was still so recent that it would have been rash to assert that it was definitive or to rule out the possibility that Protestantism—which had shown more fight, under the Marxian persecution, than the native Russian Orthodoxy—might some day return to the attack. But whether it is Marxism or Protestantism that is eventually to be victorious in Russia is a question that does not affect the present argument, considering that both these competing faiths alike have come in from abroad. The defeat—whether temporary or permanent—of Protestantism by Marxism in the Soviet Union is simply an incident in the struggle between competing alien religions, like the defeat which was inflicted upon Mithraism by Christianity in the corresponding struggle for the spiritual conquest of the Roman Empire.

As for the Shi'ah in the Ottoman Empire and Catholicism in Japan, they were both cheated of their prospective spiritual by the Kushans; and finally conquered back by the Posterior Han for a Sinic World which quickly caught fire from a Mahayanian spark that had been conveyed into the Tarim Basin from the west during the Kushan occupation. In the process by which the Shi'ah introduced itself into the main body of Orthodox Christendom, the geographical role of the Tarim Basin was played by Central and Eastern Anatolia: an integral part of the homeland of Orthodox Christendom which was detached, and annexed to the Syriac World, as a result of the Saljûq conquest (see II. D (v), vol. ii, pp. 153-4; IV. C (ii) (b) 1, vol. iv, pp. 72-5; and IV. C (iii) (c) 2 (β), vol. iv, pp. 395-9, above). When the Syriac World went into dissolution, this alien territory which it had conquered *in extremis* was included in the domain which the defunct civilization bequeathed to the 'affiliated' Iranic Society; but in the fifteenth century of the Christian Era this lost Anatolian territory was reannexed to the Orthodox Christian World by the Ottoman founders of the Orthodox Christian universal state. The Shi'ism which then tried and failed to become the universal church of the Ottoman Empire had entered Anatolia from the east during the four centuries (*circa* A.D. 1065-1465) which elapsed between the Saljûq conquest of the Anatolic army-corps district of the East Roman Empire and the Ottoman conquest of the principality of Qaramân.

conquests by being exploited—or at any rate suspected of being exploited—for illegitimate political ends. In either case the Government of the empire which the missionary religion was seeking to convert suddenly abandoned a policy of complacency for the policy of repression because it became convinced that the alien religion whose progress it had been tolerating in its dominions was being insidiously used by a foreign and hostile Power as an instrument for undermining the loyalty, and capturing the allegiance, of an unoffending neighbour's subjects. The Shī'ī insurrection of A.D. 1511 in Ottoman Anatolia under the leadership of Shāh Ismā'il's agent Shāh Qūlī convinced the sluggish Sultan Bāyezid's vehement son Sultan Selim that he was faced with a choice between losing his Asiatic dominions to the Safawis or purging them of Shi'ism; and accordingly he made an end of Shi'ism in Anatolia in the massacre of A.D. 1514:¹ an atrocity which blighted for ever the prospects of the Shī'ah in the Orthodox Christian World. It was on similar grounds in Japan that Catholicism, after being allowed to win a foothold and make some headway during the second half of the sixteenth century of the Christian Era, was afterwards frowned upon by Hideyoshi (*dominabatur* A.D. 1582–98) and was finally extirpated remorselessly by the Tokugawa between A.D. 1612 and A.D. 1638. The Japanese Government's objection to Catholicism was of the same political order as the Ottoman Government's objection to Shi'ism. It was believed that both the European Catholic residents in Japan and the Japanese converts were being turned to an illegitimate use by the Spanish Crown as agents in underhand preparations for a Spanish attack on Japanese independence; and it was in order to anticipate this supposed danger that the Japanese Government proceeded to stamp Catholicism out.

The failure of Catholicism in China was not, like its failure in Japan, the incidental effect of an extraneous political cause. In China this alien religion was eventually rejected on religious—or perhaps rather on philosophical—grounds. Yet, even here, it was not its sheer alienness that was fatal to it. In China, too, the prospects of Catholicism were blighted by the action of a foreign Power, though in this case the Power that intervened with disastrous results was of an ecclesiastical and not of a political order. The fatal act was a refusal, on the part of the Vatican and its representatives, to allow the Jesuit missionaries in China to carry on their work of translating an alien Catholic religious idiom into the traditional language of Far Eastern philosophy and ritual.² And this veto

¹ For these events see I. C. (i) (b), Annex I, vol. i, pp. 382–4, above.

² See Jenkins, R. C.: *The Jesuits in China* (London 1894, Nutt).

dealt a death-blow to the Catholic propaganda in China; for the process of cultural translation is one of the indispensable conditions for the propagation of any alien 'higher religion' in any mission-field.

Our empirical survey has led us to the conclusion that an alien origin is a help and not a hindrance to a 'higher religion' in winning converts; and the reason for this is not far to seek. The light from an alien spark is, *ex hypothesi*, a new revelation; and it is the newness that makes it attractive; but, before it can become attractive, a truth has to be made intelligible; and until this necessary work of exposition has been performed, the new truth will be inhibited from making its potential appeal. On this account the translation of the alien religion into terms of the prospective converts' native culture is a task of vital importance in any missionary enterprise. The progress of the Mahāyāna and Christianity and Mithraism, and of the worships of Isis and Cybele, in the Hellenic World went *pari passu* with the process of their translation into terms of Hellenic art and literature and philosophy, and even into terms of Hellenic ritual and piety¹ (though in these latter points the act of translation touched the very quick of the incoming alien faiths). We may also observe that this process of Hellenization was carried to greatest lengths, and was at the same time carried out with the greatest insight and discrimination, in the metamorphosis of the religion which was the eventual victor among these competitors for the captivation of Hellenic souls.² The Christian victory in the Roman Empire could hardly have been won if the Fathers of the Christian Church had not exerted themselves perseveringly, during the first four or five centuries of the Christian Era, to translate the Christian doctrine into terms of Hellenic philosophy; to build up the Christian ecclesiastical hierarchy on the pattern of the Roman civil service; to portray the Christ in the lineaments of an Orpheus; to desecrate the Cross athwart the disk of Sol Invictus;³ to mould the Christian ritual on the model of the Mysteries; and even to convert pagan into Christian festivals,⁴ and replace pagan cults of heroes by Christian cults of saints.

Whether the Jesuit Catholic missionaries in China were consciously following the precedent of the Early Christian Church in the Roman Empire, or whether they were acting on an inde-

pendent intuition of their own in seeking the same solution for the same problem, they were unquestionably doing what had been done, not only by the Early Christian Fathers, but by the missionaries of every alien religion that had ever made a spiritual conquest. Matteo Ricci (*in Oriente Extrema Fidem Catholicam propagabat* A.D. 1582-1610) did for Christianity at Macao the service that a Clement (*vivebat circa* A.D. 150—*prae* 215) and an Origen (*vivebat* A.D. 185-254) had done for the same faith at Alexandria some fourteen hundred years earlier.¹ Clement and Origen commended Christianity to the respectful and even sympathetic attention of cultivated Hellenes by deliberately winning recognition for themselves as accomplished Hellenic philosophers. Ricci—the supreme *virtuoso* in the Christian missionary's art—performed the still greater *tour de force* of obtaining for himself a tablet in a Far Eastern hall of fame as an accomplished Confucian litteratus. And if he and his successors had been allowed to persevere in their work for three centuries, instead of being pulled up short after they had been little more than one century in the field, who can say whether, in the year 1938, the former domain of the Far Eastern universal state might not have been as thoroughly permeated with Christianity as the former domain of the Hellenic universal state actually was in A.D. 538, after the unhindered completion of the Early Fathers' long and far-reaching expository work?²

¹ See further V. C. (i) (d) 6 (8), p. 539, below.

² The Jesuit missionaries in China had to contend with two adverse forces: the jealousy of their Franciscan and Dominican rivals in the China mission-field and the ignorance of the Vatican and its representatives. It was the combined operation of these two forces that eventually brought the Jesuits' work in China to naught. And this may perhaps explain why it was that the Jesuits failed in an enterprise in which the Early Fathers succeeded; for, although the rivalry between Jesuits and Friars in China has numerous parallels in the internal struggles within the bosom of the Early Christian Church in the Roman Empire, there is no parallel in this other chapter of Christian history to the obstacle which was placed in the Jesuits' path in China by the Vatican's ignorance of Far Eastern conditions. In order to translate this obstacle into Early Christian terms we should have to draw an imaginary picture of Origen and Clement doing their work at Alexandria under the authority of a supreme ecclesiastical Power whose seat was geographically remote from the Hellenic World, in some Syriac fastness into which the radiation of Hellenism had never penetrated. Supposing that our Alexandrian Christian philosophers had been bound to render an account of their stewardship to a Holy Father whose see lay in the Yaman or in Hyrcania, we may conjecture that they would have been peremptorily called to order. Even as it was, Origen did not altogether escape the stigma of heresy, though the ecclesiastical judges before whose bar his theology had to appear had all been born and brought up in Origen's own Hellenic environment and were therefore able to appreciate, in the light of their personal experience, the full strength of the case for a Christian policy of Hellenization. On this showing, it is not to be wondered at that the Jesuits' policy of Confucianization should have shocked the Vatican, which had no understanding of, or taste for, the Confucian culture to which Ricci and his successors had been making their concessions. Some of these concessions could not fail to be startling to Latin minds which had not been compelled—by the challenge of a missionary's life and work—to grapple with the problem of distinguishing between the sacrosanct essence of Christianity and its local and temporary Syriac and Hellenic and Western accidents. The Vatican's ignorance and lack of imagination were, in fact, pardonable and perhaps even inevitable; but these venial faults of head and heart were none the less disastrous for the prospects of Catholi-

Thus the failure of certain alien religions, in certain circumstances, to achieve a spiritual conquest to which they had aspired is no disproof of our thesis that alienness is, in itself, a help and not a hindrance to the spread of a 'higher religion'. We may now go on to suggest that in the histories of the 'higher religions' an inspiration that is alien and not indigenous has not only been a potent aid to success whenever it has been present, but has also been one of the regular distinguishing features of this particular species of the genus 'religions', while, conversely, a successful 'higher religion' whose inspiration is indigenous to the society in which the religion wins its way is an exceptional and abnormal phenomenon.

Our muster of 'higher religions' which appear, at first sight, to have had indigenous inspirations will include Judaism and Zoroastrianism and Islam—three religions which have found their field in the Syriac World and have also undoubtedly drawn their inspiration from the same quarter—as well as Hinduism: a religion which has found its field in the Indic World and has at the same time manifestly had an Indic inspiration. If we are to take account of imperfect representatives of the class, we may further cite Nestorianism and Monophysitism: two revised versions of Christianity which found their field in the Syriac World and which did their best to purge themselves of the Hellenic element in the Syro-Hellenic syncretism of which Christianity consists.¹ These two Syriac religious reactions against Hellenism have their Indic counterpart in the Tantric Mahāyāna: a branch of the Mahayanian Church which retreated into the interior of the Indic World, and entrenched itself in Bengal,² in the age when the Catholic Mahāyāna was breaking the bounds of its Indic birth-place and was boldly venturing out into Central Asia and thence into the Far East. Like the Nestorian and Monophysite Christianities, the Tantric

cism in China, since they had the effect of deeply offending Chinese susceptibilities which the Jesuit missionaries had been scrupulously careful to spare. As a matter of fact the irreparable damage was not done by the Papal Legate de Tournon—a young and inexperienced Savoyard who was sent out to the Far East without any expert knowledge. The mortal offence was given by the Papal Vicar-General in Fukien, Bishop Maigrot, who ought to have known better, since, as a resident in the Far East, he had as good an opportunity as the Jesuit missionaries of grasping the local situation and seeing how it appeared in Confucian eyes. The crisis was precipitated by Bishop Maigrot's edict of A.D. 1693, and it was brought to a head by his audience with the Emperor on the 12th December, 1706, when the local representative of the head of the Western Catholic Church was publicly convicted, by the head of the Far Eastern universal state, of an utter ignorance of the Confucian philosophy. This was an exposure which the Jesuit propaganda in China could not retrieve and did not survive. (See further V. C (i) (d) 6 (δ), p. 539, and V. C (i) (d) 7, vol. vi, pp. 23-4, below.)

² See II. D (vi), Annex, vol. ii, p. 405, footnote 1, and V. C (i) (c) 2, in the present volume, pp. 136-7, above.

Mahāyāna sought to adapt itself to a native mission-field by purging itself of all but the native element in its amalgam. Nestorianism and Monophysitism tried to separate their Syriac gold from the single alloy of Hellenism; the Tantric Mahāyāna tried to separate its Indic gold from the twofold alloy of the Syriac conception and the Hellenic portrayal of Buddhahood. It will be seen that our assembly of religions with an indigenous inspiration remains singularly small, even when we have brought in the stragglers from the highways and hedges. If we now inspect our recruits, we shall find that two of them really belong to the 'alien' class after all, and that those which are genuinely 'indigenous' or 'semi-indigenous' are the exceptional products of peculiar circumstances.

In the first place, if we remind ourselves of the origins of Judaism and Zoroastrianism, we shall remember that, while they are indeed, both of them, religions with a Syriac inspiration which have made their first appearance in a Syriac milieu, the Syriac populations among which they came to birth between the eighth and the sixth century B.C. were broken peoples which had been forcibly conscripted into the internal proletariat of the Babylonian Society by the Assyrian men-at-arms of the Babylonian dominant minority. It was this challenge of Babylonian aggression and domination that evoked the Jewish and Zoroastrian religious responses from the Syriac souls that were subjected to the ordeal.¹ And on this showing it is evident that we ought to classify Judaism and Zoroastrianism, not as Syriac religions with an indigenous Syriac inspiration, but rather as religions which were introduced by Syriac conscripts into the internal proletariat of a Babylonian Society upon whose native religious tradition and consciousness the Syriac inspiration of Judaism and Zoroastrianism impinged as an alien spiritual force.

Thus, in the rise and spread of Judaism and Zoroastrianism in the Babylonian World after the Assyrian annexation of the Syriac populations of Syria and Iran to the Babylonian internal proletariat we have an exact parallel to the rise and spread of Christianity and Mithraism in the Hellenic World after the Macedonian annexation of the Syriac populations of South-Western Asia to the Hellenic internal proletariat.² And, if the disintegration of the Babylonian Civilization had been as long drawn out as that of the Hellenic Civilization, and had passed through all the same successive stages, then the birth and growth of Judaism and Zoroastrianism would present themselves, in historical perspective, as events in Babylonian history—as the birth and growth of Christianity and Mithraism do, in fact, present themselves as events

¹ See V. C (i) (c) 2, pp. 119-21, above.

² See V. C (i) (c) 2, pp. 80-2, above.

in Hellenic history. Our perspective has been thrown out by the accident that Babylonian history—unlike Hellenic history—came to a premature end owing to the abnormal deadliness of the Babylonian malady of Assyrian militarism.¹ Though the Babylonian World did just manage to struggle out of its 'Time of Troubles' into a universal state, the effort which had been required in order to extinguish the Assyrian conflagration had been so exhausting that the Chaldaean founders of the Neo-Babylonian Empire were left without the strength to accomplish the tremendous task of reconstruction which they had taken upon their shoulders. This Chaldaean attempt at a Babylonian universal state collapsed; and the Syriac conscripts in the Babylonian internal proletariat were able not only to throw off their chains but also to turn the tables on their Babylonian conquerors by taking them captive in body as well as in spirit.² The Iranians became converts to the Syriac and not to the Babylonian culture; the Achaemenian Empire which was founded by Cyrus the Persian played the part of a Syriac universal state instead of taking over the mission of the abortive Babylonian universal state which it had supplanted;³ and within little more than five hundred years of Cyrus's entry into Babylon in 539 B.C. the last remnants of a prematurely disintegrated Babylonian Society had been absorbed into the tissues of the Syriac body social. It is in this perspective that Judaism and Zoroastrianism take on their present appearance of being Syriac religions with an indigenous inspiration. We can now see that in their origin they were religions of a Babylonian internal proletariat to which their Syriac inspiration was alien.

As for the partially de-Hellenized Syriac and Indic religions of Nestorianism and Monophysitism and the Tantric Mahāyāna, and the thoroughly de-Hellenized Syriac and Indic religions of Islam⁴ and Hinduism,⁵ we have already observed in other contexts⁶ that these were all of them expressions, in Syriac and Indic re-

¹ See IV. C (iii) (c) 3 (α), vol. iv, pp. 468-84, above.

³ The entente between Cyrus and the Syriac victims of his vanquished Babylonian adversaries was signified in his gracious act of granting the Jews permission to return home from the land of exile; and the Iranian conqueror's Syriac proclivities were appreciated and extolled by these Jewish beneficiaries. This Iranian saviour of Jewry from a Babylonian captivity was the first temporal ruler to be hailed by a Jewish poet with the title of Messiah.

⁴ 'Thus saith the Lord to his anointed, to Cyrus (*Septuagint*: τῷ Χριστῷ μου Κύρῳ), whose right hand I have holden, to subdue nations before him. . . . For Jacob my servant's sake, and Israel mine elect, I have even called thee by thy name; I have surnamed thee, though thou hast not known me' (Isaiah xlv. 1 and 4).

⁷ See the references on p. 368, footnotes 1 and 2, above.

ligious terms, of a revolt in the Syriac and Indic worlds against the intrusive social force of Hellenism. This means that these religions are genuine representatives of the class of 'higher religions' whose inspiration is indigenous; and, while Nestorianism, Monophysitism, and the Tantric Mahāyāna may be imperfect specimens, this cannot be said of either Hinduism or Islam. At the same time we may notice that this Syriac and Indic revolt against Hellenism is only the last chapter in the history of the encounter between these three civilizations. This chapter of revolt and estrangement had been preceded by a chapter of forbearance and intercourse; and this earlier and happier relation¹ had likewise found expression in religious terms of its own. Its monuments are the syncretistic religions of Catholic Christianity and the Catholic Mahāyāna; and both of these religions were discovered by the Hellenic internal proletariat in the light of an alien inspiration—Syriac in the one case and Indic in the other. This chapter which saw the birth of a Catholic Christianity and a Catholic Mahāyāna was assuredly a more fruitful and important and significant phase in the encounter between Hellenism and its two neighbours than the later chapter which gave birth to Nestorianism and Monophysitism and the Tantric Mahāyāna, and afterwards to Islam and Hinduism.

In this last sentence we have implicitly made a judgement of value as between one 'higher religion' and another. We have judged that Catholic Christianity is a more valuable representative of its species than Nestorianism or Monophysitism or Islam, and that the Catholic Mahāyāna is more valuable than the Tantric Mahāyāna or Hinduism. Are we warranted in taking a liberty with religions that we have scrupled to take with civilizations? At an early point in this Study² we debated whether we should take account of possible differences of value in comparing one civilization with another, and in this case we decided not to presume to act as judges or dividers.³ When we pass from the study of civilizations to the study of religions, are we going to abandon this discreet attitude of neutrality and to take the perilous plunge into passing judgements and meting measures?⁴ Our reply to this question may perhaps be postponed until we come to deal, in a later Part,⁵ with those universal churches in

¹ We have, however, also seen that there was an earlier chapter still which—like the third, and unlike the second—was a chapter of war and not of peace, though in this first chapter it was the intrusive Hellenic Civilization, and not its Syriac or Indic victim, that took the offensive. In this first chapter, too, the Syriac reaction expressed itself in religious forms: in the militant 'Zealot' outbreaks of a Eunus of Enna and a Judas Maccabaeus (see V. C (i) (c) 2, pp. 68–9, above).

³ Luke xii. 14.

which the victorious 'higher religions' have embodied themselves. In the present chapter we must turn to the consideration of a point which presents itself as a corollary to our conclusion that the 'higher religions' which have alien, and not indigenous, inspirations are the normal representatives of their species.

If a religion has an alien inspiration, then manifestly the origin and the nature of that religion cannot be understood without taking account of a contact between at least two civilizations: on the one hand the civilization in whose internal proletariat the new religion arises, and on the other hand the different civilization (or civilizations) from which the alien inspiration (or inspirations) of the rising religion is derived. This point about the study of 'higher religions' is simple and self-evident; but—all the more imperatively on that account—it compels us to make a radical new departure; for it requires us to relinquish the basis on which this Study has so far been built up.

So far we have been dealing in terms of civilizations; and we have assumed that any single civilization will afford a practicable field of study because, at the outset of our inquiry,¹ we satisfied ourselves that any given civilization constituted a social 'whole' which was intelligible in isolation from whatever social phenomena might present themselves outside the spatial and temporal limits of this particular society. Indeed, we originally defined a civilization as 'an intelligible field of study'; and our approach to the identification of our twenty-one representatives of this species of societies was subjective as well as empirical. We started our inquiry from the observation that the national community—which has been the actual standard unit employed in most of the historical study that has been carried out in our Western World in its Modern Age—proves to be a fragmentary, and therefore unintelligible, slice of some field of greater magnitude; and we then mapped out the bounds of this wider field in our own social landscape by exploring outwards beyond the ragged edges of one particular parochial community—and also backwards behind the brief span of one particular generation—and observing, as we went on enlarging our spatial and our temporal horizon, that the intelligibility of the social landscape at first rose steadily in degree, but then reached a maximum at a certain remove, and afterwards fell off until—long before we had embraced in our field of vision the whole living generation and past ancestry of Mankind on the surface of the planet—the degree of intelligibility of our field of vision had sunk once more to the level at which it had stood to begin with, when we were confining our view within the 'short

¹ In Part I. B, vol. i, above.

and narrow-verged shade' of 'some single herb or tree' in the tribal forest. It was by this empirical manoeuvre from a subjective starting-point that we approximately ascertained the extension, in Space and in Time, of our own Western Society; and it was only after this that we went on to identify twenty other representatives of the same species of society by analogy with our first-found specimen.

This resumé of the overture to our inquiry¹ may serve to remind us that a civilization, in the sense in which we have defined and employed the term, is 'in the last analysis' a field of study which appears to be intelligible within its own limits; and up to this point we have found ourselves able to work on the assumption that the intelligible field is always and everywhere of the order and the dimensions that are exhibited in our own Western body social and in its twenty sisters. By enlarging our field of operations from the nation to the civilization of which the nation is a fragment, we have found it possible to make a study of History in terms of civilizations and their careers—from genesis to growth and from breakdown to disintegration. But 'the relativity of historical thought'² has now caught us out in our turn, as we have seen it catch out the historians who have allowed their horizon to be determined by the narrower frontiers of some single national community or city-state; for the particular 'intelligible field' that has sufficiently well served our purpose so far is manifestly relative, in magnitude to the length, and in locus to the position, of the particular base-line from which we first set out to survey the extent of this field and to plot out its limits. Our original base-line, as we have reminded ourselves, was the modern Western national community which the national historian accepts as his social universe; and it is perhaps really surprising that a survey conducted from this base of operations should have carried us so far as it has; for the national community is far indeed from being adequate to the historian's purpose, even when it is taken as a base-line and not as a boundary.

The first step in our inquiry made it clear to us that the national community, as we know it in our modern Western World, is both eccentric in its position in the historical landscape and petty in its scale; and the combination of these two untoward features makes it a peculiarly unfavourable starting-point for a study of History. For us, in our time and place, it was not within our power to start from anywhere else; for the national community is the social prison-house in which our modern Western souls are incarcerated.

¹ See Part I, *passim*, especially I. B (v) and I. C (ii), in vol. i, above.

² See Part I. A, in vol. i, above.

The best that we could do was to peer over the battlements and extend our field of vision, beyond the imprisoning walls, as far as the eye could reach. But we have come now to a parting of the ways in this mental voyage of exploration. If we cannot or will not now break out of these prison walls, then we must be content to abandon our inquiry at the present point; for we have now surveyed the whole of the landscape that is visible from within the *enceinte* of this outlandish and close-cribbed *donjon*. We have, in fact, now surveyed the whole of the intelligible field that falls within the horizon of an observer who is tied down to a national standpoint; and from this observation-post we can see no farther, however intently we may crane our necks and strain our eyes. From our parochial standing-ground the single civilization is the widest field of vision that can be attained; and, since our reconnaissance has now reached this limit in all four quarters of the compass, one of the alternatives before us is to recite, for the second time, the famous words¹ in which Pindar renounces the pursuit of his quest into the Ocean beyond the Pillars of Hercules.

Probably this would have been the alternative to which a Hellenic inquirer would have resigned himself if he had found himself in our present situation; for his Theban or Athenian horizon was bounded for him by the limits of his Hellas as rigidly as the English or French horizon is bounded for us by the limits of our wider, yet still finite, Western World. We children of Western Christendom, however, have not the same excuse as Pindar and his Hellenic contemporaries for giving up the game at this point; for an alternative course lies open to us; and the way has been pointed by one of the Fathers of our Western Christian Civilization. In the fifth century of our era, when the post-Hellenic interregnum had set in and the Gothic sack of Rome had proclaimed the break-up of the Hellenic universal state, one child of the age—a Hellene who was also a Christian, and a genius who was also a saint—had the spiritual insight to see that the venerable social edifice which was falling about his ears was after all a prison-house, and that the Hellene's catastrophe might spell the Christian's liberation. The falling walls of Jericho which were giving entry to the Israelite invader would also set the Canaanite captive free. And so Augustine's reply to the challenge of Alaric's stroke was to spring out of the shattered prison-house of the City of Man into the infinite liberty of an inviolate and inviolable City of God.²

¹ Pindar's Third Olympian Ode, *ad fin.*, quoted in II. C (i), vol. i, p. 205, above.

² Saint Augustine's theme in the *De Civitate Dei* has been touched upon in V. C (i) (c) 3, p. 224, footnote 1 and p. 225, footnote 1, above. The spirit of Saint Augustine, as it is revealed in the *The Civitate Dei*, may be both compared and contrasted with the spirit

Can we escape from our own present *impasse* by following the lead of this Christian mentor and master? The mental—or rather spiritual—feat that is required of us is to burst the cramping bounds of our English or French or German or American social prison-house—whichever of the nationalisms it may be that has been holding us hide-bound—and to re-occupy the place that belongs to us in a greater kingdom which was Augustine's by right of spiritual conquest and is still ours to-day by privilege of cultural inheritance. If once we can escape from the parochial standpoint of an American or German or French or English member of a Western brood of nations, and can take our stand, instead, upon our birthright in Christendom, which was the spiritual habitation of our forebears,¹ then our social horizon will assuredly expand to farther distances which we have not yet begun to explore. For the 'intelligible field of study' which unfolds itself to an observer whose feet are planted on the mountain-heights of one of the 'higher religions' quite outranges the limits of the single civilization which is the widest field that can be surveyed from the squat battlements of a national prison-fortress. We have just observed² that the single civilization, which, when regarded from the standpoint of one of its national fragments, has worn the appearance of a fully 'intelligible field of study', shrivels up, in its turn, into an unintelligible fragment of some far larger whole when we place ourselves at the standpoint, no longer of a national community, but of one of those churches in which the 'higher religions' embody themselves. Within the ambit of a single civilization the origin and nature of a 'higher religion' are unintelligible *ex hypothesi*, since we have seen that the birth of a 'higher religion' presupposes a foregoing contact and intercourse between two civilizations at the least. In a mental voyage of discovery which takes its departure from a church and not from some parochial political community, it is evident that the 'intelligible field of study' will be of an altogether

that is attributed to Epicurus in a magnificent passage of Lucretius's *De Rerum Natura* which has been quoted at an earlier point in this Study (in II. C (ii) (b) 1, vol. I, p. 299, above). Like the Hellenic philosopher, the Christian father boldly defied a power which was apparently irresistible, and won by his audacity a passage from a prison-house to freedom; but this superficial likeness covers a fundamental difference; for Epicurus broke his way out of the Hell of Superstition into the Material Universe of Science through a defiance of God, whereas Augustine took the Kingdom of Heaven by storm through a defiance of human forces that were destroying the Kingdom of This World. (For Saint Augustine's vision of the Kingdom of God see further V. C (i) (d) 11, vol. vi, pp. 152-4 and 166-7, and V. C (i) (d) 11, Annex II, vol. vi, pp. 365-9, below.)

¹ For the loss of the consciousness of common citizenship in the Western *Respublica Christiana*, simultaneously with the emergence of the consciousness of parochial nationality, at the beginning of the Modern Age of our Western history see I. B (iii), vol. I, pp. 33-4, above. In the Russian Orthodox Christendom the corresponding consciousness of common Christianity lasted longer. In Russia the ordinary word for 'peasant' was *Khrestianin* down to the Revolution of A.D. 1917.

² On p. 372, above.

higher order of magnitude than that of the single civilization which has sufficed us hitherto. Possibly we shall find that our new field also extends into a different spiritual dimension—but this is a possibility which we can now examine at our leisure;¹ for, almost without noticing what we have been doing, we have chosen and taken our course. The Pillars of Hercules are behind us, and the sea on which we are sailing is no longer the familiar land-bound *Mare Nostrum*.

(d) SCHISM IN THE SOUL

1. *Alternative Ways of Behaviour, Feeling, and Life*

The schism in the Human Body Social, which we have been examining in the foregoing chapter as one of our criteria of the disintegration of a civilization, is an experience which is collective and therefore superficial. Its significance lies in its being the outward visible sign of an inward spiritual rift; and this spiritual rift is riven in human souls; for, among all the almost infinitely various manifestations of Human Nature, the Soul alone is capable of being the subject of spiritual experiences and the author of spiritual acts.² A schism in the souls of human beings will be found at the heart of any schism that reveals itself on the surface of the society which is the common ground of these human actors' respective fields of activity;³ and the several forms which this inward schism may take must engage our attention now, if we wish to pursue our search for a criterion on a deeper level of reality.

Schism in the souls of the human 'members' of a disintegrating civilization displays itself in a variety of shapes because it arises in every one of the various ways of behaviour, feeling, and life which we have found to be characteristic of civilizations—or, rather, of the action of the human beings who play their part in civilizations—in those phases of social history which we have labelled 'genesis' and 'growth'. In the disintegration-phase each of these single lines of action is apt to split into a pair of mutually antithetical and antipathetic variations or substitutes, in which the response to a challenge is 'polarized' into two alternatives—one passive and the other active, but neither of them creative. A choice between the active and the passive option is the only freedom that is left to a soul which has lost the opportunity (though not, of course, the capacity) for creative action through being cast for a part in the

¹ See V. C (i) (d) 11, vol. vi, pp. 149-68, below.

² This elementary truth—which has not ceased to be true through being unpalatable to many modern Western minds—has been acknowledged already in this Study in III. C (ii) (a), vol. iii, pp. 230-1, above.

³ For this definition of the nature and structure of a society see III. C (ii) (a), in vol. iii, above.

tragedy of social disintegration as either one of the villains or one of the victims of the piece. As the process of disintegration works itself out, the alternative choices tend to become more rigid in their limitations, more extreme in their divergence, and more momentous in their consequences. That is to say, the spiritual experience of schism in the Soul is a dynamic movement, not a static situation.

We may now pass these alternative substitutes for creative activity in review, and take a bird's-eye glance at their interactions with one another, before we attempt an empirical survey of the historical manifestations of each of them.

To begin with, there are two ways of personal behaviour which are alternative substitutes for the exercise of the general faculty of creativeness.¹ Both of them are attempts at self-expression. The passive attempt consists in an *abandon* (ἀκράτεια) in which the Soul 'lets itself go', in the belief that by giving free rein to its own spontaneous appetites and aversions it will be 'living according to Nature'² and will automatically be receiving back, from the cornucopia of this mysterious and therefore possibly puissant goddess,³ the precious gift of creativity which the sick Soul has been conscious of losing. The active alternative to this passive *abandon* is an effort at self-control (ἐγκράτεια) in which the Soul 'takes itself in hand' and seeks to discipline its 'natural passions'—through a régime of spiritual exercises which is conceived on the analogy of the physical training (ἀσκήσις) of an athlete—in the opposite belief that Nature is the bane of creativity and not its source, and that to 'gain the mastery over Nature' is the only way of recovering the lost creative faculty.

Then there are two ways of social behaviour which are alternative substitutes for that mimesis of creative personalities which we have found to be a necessary, though perilous, short cut on the road of social growth.⁴ Both of these substitutes for mimesis are attempts to step out of the ranks of a phalanx whose 'social drill' has failed to work—with the result that the uncreative mass, which formerly followed its leaders through intricate evolutions in orderly formation, now stands immobilized, irresolute, and apprehensive: a helpless target for hostile attack. The passive attempt

¹ An attempt to apprehend—'through a glass darkly'—the nature of creativeness in itself has been made in II. C (ii) (b) 1, in vol. i, above.

² 'The Return to Nature' is interpreted as a symptom of social disintegration by Oswald Spengler in *Der Untergang des Abendlandes*, vol. i (Munich 1920, Beck), p. 286. Besides being a gesture of *abandon*, it is also an expression of archaistic-mindedness (see V. C (i) (d) 8 (α), vol. vi, pp. 58-9, below).

³ The deification of Nature is a classic example of the human weakness which takes *omne ignotum pro magnifico* (Tacitus: *Agricola*, chap. 30).

⁴ See III. C (ii) (b), vol. iii, pp. 245-8, and IV. C (iii) (a), vol. iv, pp. 122-33, above.

to break this formidable social deadlock takes the form of committing the misdemeanour of truancy. The soldier realizes with dismay that the regiment has now lost the discipline which has hitherto fortified his *moral* and secured his safety and given strength to his right arm; and, in this unforeseen and unbargained-for situation, the truant-minded soldier allows himself to believe that he is absolved from his military duty. In that unedifying frame of mind the truant steps out of the ranks backwards—in the contemptible and futile hope of saving his own skin by leaving his comrades in the lurch. There is, however, another alternative way of facing the same ordeal which is illustrated by the famous story¹ of the two Spartiate soldiers Aristodâmus 'the Truant'² and Eurytus.

The story relates that the two men were on leave together in hospital behind the front—both of them incapacitated for active service by an acute attack of ophthalmia—when the news was brought to them that the rest of the devoted band of three hundred Spartiates were being outflanked at Thermopylae by a turning movement and were therefore now doomed to certain death in consequence of King Leonidas' decision not to retreat. In these circumstances Eurytus and Aristodâmus were 'both presented with the possibility of returning safely home to Sparta together unless they preferred the alternative of losing their lives with their comrades', and, 'when this choice was presented to them, they could not make up their minds to agree, but took different views of their duty'. While Aristodâmus slunk off home to Sparta, Eurytus made his batman lead him to the battlefield; and when, upon reaching the front, the Helot servant turned and fled, his Spartiate master flung himself—blind-eyed—into the mêlée in order to meet death still more swiftly, and against still more fearful odds, than his two hundred and ninety eight comrades whom he had rejoined—unbidden—by this heroic *tour de force*. It is evident that Eurytus's way of distinguishing himself from the rank and file was the antithesis of Aristodâmus's. Instead of stepping backwards, he stepped forwards. Instead of lapsing into truancy, he rushed into martyrdom.

A martyr is primarily a soldier who takes it upon himself to bear witness to the supreme value and the absolute obligation of the military virtues in a situation in which his only means of giving his testimony is to sacrifice his own life on a forlorn hope. His self-sacrifice may have the incidental aim of carrying his comrades to victory by breaking a breach in the enemy line—as when

¹ See Herodotus, Book VII, chaps. 229–31, and Book IX, chap. 71.

² ὁ τρέας Ἀριστόδημος.

Arnold von Winkelried threw himself upon the Hapsburg pikes; or when Alessandro Pizzoli drew the fire of the Neapolitan cannon by dropping down into the lane which the piece commanded, and then charging the cannon's mouth at point-blank range;¹ or when the Decii dedicated themselves to Tellus and to the Di Manes as sacrificial victims who were to get themselves slain on the battlefield by the enemy's hand.² But the fundamental motive of martyrdom is not to secure material success here and now for the cause to which the martyr has dedicated himself. The Spartan soldier Eurytus chose to bear witness to the virtues of the Lycurgian *agôgê* by sacrificing his life in an action in which an utter physical defeat was a foregone conclusion; and the same *esprit de corps* has inspired the innumerable heroes of innumerable stricken fields who have died rather than surrender to an already victorious adversary. In essence the martyr is a soldier who steps out of the ranks on his own initiative³ in a forward direction in order to

¹ Trevelyan, G. M.: *Garibaldi and the Making of Italy, June–November, 1860* (new impression, London 1928, Longmans, Green), p. 84.

² For this Roman practice of *devotio*, which was a literal self-sacrifice on the part of the general commanding, see Livy, Book VIII, chaps. 9–10, and Book X, chaps. 28–9.

The practice outraged the Romans' Greek antagonist Pyrrhus both as a rationalist and as a 'clean fighter', and, upon receiving intelligence, on the eve of the Battle of Ausculum, that the commander of the opposing Roman army, Publius Decius Mus the Third, intended to dedicate himself in this fashion on this occasion, Pyrrhus is said to have made an allocution on the subject to his troops, with the twofold object of removing from their minds any superstitious fears which the report of Decius's intention might have aroused, and at the same time instructing them to make the Roman commander's gesture fall flat by insisting upon taking him alive. On the first point Pyrrhus is reported to have observed that 'a single man cannot defeat a multitude by dying, nor can a piece of spell-binding and black art (*ἐπωδὴν καὶ μαγανείαν τινά*) prove more than a match for armaments and valour (*κρείττω τῶν ὀπλῶν καὶ τῶν ἀνδρῶν γενέσθαι*)'. On the second point he was not content with giving orders to his own troops to refuse Decius all opportunity of finding the death which he was proposing to seek: he also sent a message to Decius himself to warn him that his purpose would not meet with success, and further to threaten him that he would be put to death in an unpleasant way after being taken alive (*ζωγρηθέντα κακῶς ἀπολείσθαι*). The story relates that, on receiving this message, Decius gave up the idea (Dio Cassius: fragments of Book X = Zonaras, Book VIII, chap. 5, §§ 1–3. The passage will be found in U. P. Boissvain's edition of Dio, vol. 1 (Berlin 1895, Weidmann), p. 133).

According to Beloch, K. J.: *Römische Geschichte bis zum Beginn der Punischen Kriege* (Berlin and Leipzig 1926, de Gruyter), pp. 440–2, the alleged *devotiones* of the first Publius Decius Mus at Vesperis in 340 B.C. and of his son and namesake at Sentinum in 295 B.C. are both apocryphal and are both to be accounted for as alternative transfers of a genuine *devotio* of the third Publius Decius Mus in 279 B.C. at Ausculum. In Beloch's view P.D.M. III really did commit *devotio*; and the story that Pyrrhus successfully frustrated his intention was afterwards invented in deference to the awkward fact that at Ausculum the Romans actually suffered a heavy defeat, whereas a successfully committed *devotio* ought to have been an infallible means of procuring a victory. This is perhaps an excessive indulgence in 'the higher criticism'!

³ A critic may here object that a martyr is often inspired by the heroic example of a predecessor whom he loves and admires. When Publius Decius Mus devoted himself at Sentinum in 295 B.C., we must suppose (if, *pace* Beloch, we accept the three successive *devotiones* in the tradition as being all alike authentic) that he was consciously imitating his father and namesake who had devoted himself in 340 B.C. at Vesperis; and unquestionably every Christian martyr is consciously imitating the Crucifixion of Christ. Martyrdom, the critic may conclude, is not a substitute for mimesis: on the contrary, it is an illustration of it. We may reply that an act of martyrdom, like any other act, may become an object of mimesis, but that the crucial case is the conduct of the protomartyr in any given series, and that, when we examine this original act of martyrdom, we invariably

go beyond the demands of duty. While in normal circumstances duty demands no more of the soldier than that he should risk his life to the minimum extent that may be necessary for the effective execution of his superior officer's orders, the martyr courts death for the vindication of an ideal, without necessarily having any expectation at all that his self-sacrifice will secure a material victory for his tribe or country. And, if this is true of the military prototypes of martyrhood, it is true *a fortiori*, as we shall see, of the nobler army of martyrs who lay down their lives in contests which make as exacting a demand as any military action can make upon the courage and generosity and faith of the combatant, without offering him those adventitious aids to his *moral* that are provided by the physical excitement and the mass-suggestion of the literal battle-field.

When we pass from the plane of behaviour to that of feeling, we may first take note of two ways of personal feeling which are alternative reactions to a reversal of that movement of Promethean *élan* in which the nature of growth appears to reveal itself.¹ Both these feelings reflect a painful consciousness of being 'on the run' from forces of evil which have not only taken the offensive but have also established their ascendancy so potently that they now march from victory to victory and go from strength to strength.² The passive expression of this consciousness of continual and progressive moral defeat is a sense of being adrift in a Universe in which Evil is triumphant in the Macrocosm. The routed Soul is prostrated by a perception of its objective failure to master and control its environment; and it is tempted to resign itself to the belief that the Universe, including the Soul itself, is at the mercy of a power which is as irrational as it is invincible: the ungodly goddess with the double face who is propitiated under the name of Chance (*Τύχη*) or is endured under the name of Necessity (*Ἀνάγκη*). Alternatively, the moral defeat which desolates the routed Soul may be felt as a failure to master and control the Soul's own self; and in that case the expression of the Soul's consciousness of defeat will be active. The Soul will then be possessed by a sense of sin; and, turning its gaze inwards from the Macrocosm to the Microcosm, it will gird itself for the arduous spiritual enterprise of attacking and overcoming *Karma*: the cumulative burden of the excess of evil over good in the Soul's own action in the past.

We have also to notice two ways of social feeling which are alter-

find that it is a voluntary action which goes beyond the call of duty and which is evoked by a social situation in which the normal 'social drill' of mimesis has broken down. The very object of the protomartyr is to give a new example.

¹ The nature of growth has been discussed in Part III. B, in vol. iii, above.

² Psalm lxxiv. 7.

native substitutes for the sense of style—a sense that is the subjective counterpart of the objective process of the differentiation of civilizations through their growth.¹ Both these feelings betray a loss of this same sensitiveness for form; but their respective ways of responding to an identic challenge are poles apart. The passive response is an acquiescence in the total loss of all sense of form as a consequence of the loss of the particular style of the particular civilization that has now passed over from growth into disintegration. The Soul surrenders itself to the melting-pot; and a negative sense of promiscuity then comes to pervade every sphere of social activity. In the sphere of social intercourse it results in a blending of incongruous traditions and in a compounding of incompatible values (*παμμυξία*); in the media of language and literature and visual art it declares itself in the currency of a *lingua franca* (*κοινή*) and of a similarly standardized composite style of literature and painting and sculpture and architecture; in the realm of philosophical ideas and of religious beliefs and practices it produces ritual and theological syncretisms. This passive response is not always sharply distinguished by students of the phenomena of social disintegration from the active response which is really its extreme antithesis. This active response takes the loss of a style of living which has been local and ephemeral as an opportunity, and a call, to adopt another style which partakes of what is universal and eternal: *quod ubique, quod semper, quod ab omnibus*.² When it rises to this active response, the Soul finds that the effacement of the characteristic form of the disintegrating civilization has brought it face to face, not with a Chaos void of any form at all, but with a Cosmos whose circumambient form and divine architecture are now at last coming into view through the rents in the screen of lath-and-plaster work with which Man has sought to shut out an overwhelming vision of Eternity and Infinity.³

¹ For this differentiation through growth see III. C (iii), in vol. iii, above.

² Saint Vincent of Lérins: *Commonitorium Primum*, chap. 2 (Migne, J.-P.: *Patrologia Latina*, vol. i, col. 640).

³ An almost naively self-complacent boast of juvenile proficiency in this art of self-protective spiritual jerry-building is made in the following passages from Mr. H. G. Wells' *Experiment in Autobiography*, vol. i (London 1934, Gollancz), pp. 78–9, 96, and 144:

'I was glad to think that between the continental land masses of the World, which would have afforded an unbroken land passage for wolves from Russia and tigers from India, and this safe island on which I took my daily walks, stretched the impassable moat of the English Channel. I read, too, in another book, about the distances of the stars, and that seemed to push the All Seeing Eye very agreeably away from me. . . .

'I felt it must be rather empty and cheerless beyond the stars, but I did not let my mind dwell on that. My God, who by this time had become entirely disembodied, had been diffused through this space since the beginning of things. He was already quite abstracted from the furious old hell-and-heaven Thunder God of my childish years. His personality had faded. . . .

'It must be hard for intelligent people nowadays to realize all that a shabby boy of fifteen could feel as the last rack of a peevish son-crucifying Deity dissolved away into blue sky, and as the implacable social barriers, as they had seemed, set to keep him in

This active response is an awakening to a sense of unity which broadens and deepens as the vision expands from the unity of Mankind, through the unity of the Cosmos,¹ to embrace the unity of God.

If we pass on, in the third place, to the plane of life, we shall encounter, here again, two pairs of alternative reactions to match the two pairs that have already presented themselves on each of the two preceding planes of feeling and behaviour. On this third plane, however, the picture departs from the previous pattern in three respects. For one thing the alternatives which here replace the single movement that is characteristic of the stage of growth are variations on that movement rather than substitutes for it. Secondly both pairs of alternatives are variations upon the same single movement—a movement which we have described² as a transference of the field of action from the Macrocosm to the Microcosm. Thirdly the two pairs of alternative ways of life that make their appearance in the life of a disintegrating civilization, as variations upon the process of transference, are differentiated from one another by a difference which is sufficiently profound to account for the duplication. In one pair the temper of the reactions is violent; in the other it is gentle.

This parting of the ways into violent and gentle courses in the history of a disintegrating society first caught our attention when we were examining the response of the internal proletariat of the Hellenic Society to the challenge from the dominant minority. We stumbled upon the contrast in the famous antithesis between the violent spirit of Theudas and Judas of Galilee and their partisans and the gentle spirit of Jesus and his disciples.³ In that context

that path unto which it had pleased God to call him, weakened down to temporary fences he could see over and presently perhaps hope to climb over or 'push aside.'

The unconscious irony of these passages is heightened by the very expressiveness of the author's literary genius. Mr. Wells here reveals himself building up defensive screens and fancying all the time that he is pulling down constricting barriers; contracting the spiritual bounds of his microcosm and imagining that he is enlarging the span of the Universe because he is pushing the physical frontiers of his macrocosm out to a mathematical infinity. To all appearance he is unaware of the truth that, as God dissolves into blue sky, the shades of the prison-house are closing around the growing boy.

¹ A human 'political animal' who has apprehended the unity of the Cosmos can most aptly describe his spiritual discovery in the political metaphor of citizenship in a cosmic society; and the Greek name for this cosmic society is *Κοσμοπόλις*; but in the current usage of the English language the adjective 'cosmopolitan', which has been coined from the Greek substantive, has been divorced from its proper meaning in order to describe the *παμμυξία* which the melting-pot produces. This arbitrarily incorrect usage has no doubt played its part in the blurring of the sharp and vital distinction between the true *Cosmopolis* and its exact antithesis the Melting-Pot. The English adjective which comes nearest to expressing the connotation of the Greek word *Κοσμοπόλις* is 'catholic' in the non-ecclesiastical meaning of the term.

² In III. C (i) (d), in vol. iii, above.

³ See V. C (i) (c) 2, pp. 72-3, above. A distinction between several different positive realities underlying the negative phenomenon of Gentleness or Non-Violence is drawn in V. C (i) (c) 2, Annex III, pp. 588-90, below.

we went on to notice that the same contrast could be discerned—unmistakably, though perhaps not quite so clearly—in the responses of the Hellenic dominant minority and external proletariat. In the history of the dominant minority we detected this contrast in the antithesis between the destructive temper of the Roman militarists from the time of the Hannibalic War to the time of Augustus and the constructive *êthos* of the Roman civil servants from the time of Augustus to the time of Alexander Severus.¹ In the history of the external proletariat we detected a corresponding contrast, in the last chapter of the story, between the temper of a Genseric and the temper of a Theodoric.² In the rest of our long review of internal and external proletariats we have come across this distinction between violent and gentle courses time and again; and, now that we have passed on from the superficial study of schism in the Body Social to the deeper study of schism in the Soul, we shall find that the prominence of this parting of the ways between Violence and Gentleness in the landscape of social disintegration is no mere fortuitous optical effect of an empirical survey, but is an essential feature in the plot of the spiritual drama which the social process half expresses and half obscures.

With this preface our violent and our gentle pair of variations on the movement of transference from the Macrocosm to the Microcosm may now be brought on to the stage. In the violent pair the passive reaction may be described as Archaism and the active as Futurism. In the gentle pair the passive reaction may be described as Detachment and the active as Transfiguration.

Archaism and Futurism are two alternative attempts to substitute a mere transfer in the Time-dimension for that transfer of the field of action from one spiritual plane to another which is the characteristic movement of growth. In both Archaism and Futurism the effort to live in the Microcosm instead of the Macrocosm is abandoned for the pursuit of a Utopia³ which would be reached—supposing that it could actually be found 'in real life'—without any challenge to face the arduous change of spiritual clime. This external Utopia is intended to do duty, in place of the inward spiritual cosmos, as an 'Other World'; but it is an 'Other World' only in the shallow and unsatisfying sense of being a negation of the Macrocosm in the momentary present state of the Macrocosm's existence here and now. The Soul that has been daunted by finding that it has been called on to play its part in life in the

¹ See V. C (i) (c) 1, pp. 38-9, and V. C (i) (c) 2, pp. 78-9, above.

² See V. C (i) (c) 3, pp. 223-7, above.

³ For Utopias as attempts to 'peg' falling civilizations see Part III. A, vol. iii, pp. 88-106, above.

tragedy of social disintegration still cannot repudiate all movement or aim or purpose, since that would mean committing outright spiritual suicide; so it seeks to 'get by' through taking the easiest spiritual option that is open to it. Instead of continuing to attempt to make the formidable passage from the Macrocosm to the Microcosm, it now seeks to fulfil the bare letter of the Law of Life by making a perfunctory transfer which does not involve any departure from the level of the Macrocosm to a different spiritual height or depth. It proposes to perform what is required of it by making its move from the Macrocosm as it is to-day to a goal which is simply another state of the self-same Macrocosm as it may once have been in the Past or as it may some time come to be in the Future. Archaism places in the City of Cecrops¹ the treasure that it withdraws from the City of Pericles, while Futurism withdraws its treasure from the same City of Pericles in order to place it in the City of the Sun.²

In terms that we have coined for ourselves in earlier passages of this Study, Archaism may be defined as a reversion from the mimesis of contemporary creative personalities to a mimesis of the ancestors of the tribe: that is to say, as a lapse from the dynamic movement of Civilization to the static condition of Primitive Mankind in its latest state.³ It may be defined, again, as one of those attempts at a forcible stoppage of change which result, in so far as they succeed, in the production of social enormities.⁴ In the third place, Archaism may be taken as an example of that attempt to 'peg' a broken-down and disintegrating society which, in another context,⁵ we have found to be the common aim of human Utopias and of those insect societies to which the arrested human societies approximate. In corresponding terms we may define Futurism as a repudiation of any mimesis of anybody—present or past, creative or conservative—and also as one of those attempts at a forcible accomplishment of change which result, in so far as they succeed, in the production of social revolutions that defeat their own purpose by tumbling over into reaction.⁶ In fine, Futurism only avoids the static immobility of Archaism at the price of moving like a convict on a treadmill or like a captive

mouse in a revolving cage; and the futility of this revolutionary motion is summed up in the devastating aphorism *Plus ça change, plus c'est la même chose*.¹

For those who put their trust in either of these would-be substitutes for the transfer of the field of action from the Macrocosm to the Microcosm, there lies in wait an ironical common fate. In seeking their alternative easy options these 'defeatists' are actually condemning themselves—whether blindly or with open eyes—to a violent denouement which is bound to overtake them, when once they have set their feet on either the archaistic or the futuristic path, because in both cases they are attempting something which is contrary to the order of Nature. The quest of the inner life, which seems—and is—so formidable an undertaking, is at any rate no impossibility for a Soul that is playing its temporary part on the stage of the External World; for, since the Microcosm and the Macrocosm are different planes of spiritual experience and activity, the transference of the Soul's treasure from the outward to the inward life is equally difficult, or equally easy, whatever the momentary state of the Macrocosm may be. On the other hand it is intrinsically impossible for the Soul, in so far as it is living in the outward life, to extricate itself from its present place in the current of the 'ever-rolling stream' by taking either a flying leap backward upstream into the Past or a flying leap forward downstream into the Future. The archaistic and the futuristic Utopia alike are Utopias in the literal sense of being localities which have no real existence. These two alluring *alibis* are thus both of them unattainable *ex hypothesi*; and the sole and certain effect of striking out towards either of them is to produce a troubling of the waters with a violence that brings no healing.

The crescendo movement of violence that is set in motion by Futurism has been described, with an inimitable combination of exactitude and vividness, by a famous nineteenth-century Western socialist.

'Lorsqu'arrive le temps des époques critiques ou de destruction,² c'est que des faits nouveaux se sont produits; c'est que la société éprouve des besoins nouveaux, que ne comporte pas et que ne peut comprendre le cadre trop étroit, et devenu inflexible, de la croyance établie et de l'institution politique qui la réalise. Cependant, ces faits nouveaux, ces exigences d'avenir, cherchent à se faire jour, à prendre place; d'abord ils viennent se briser contre l'ordre ancien; mais, par

¹ Alphonse Karr: *Les Guêpes*, Janvier 1849 (ed. Michel Lévy, vol. vi, p. 304), according to Harbottle, T. B., and Dalbiac, P. H.: *Dictionary of Quotations (French and Italian)* (London 1901, Swan Sonnenschein).

² For the sense in which this term is used in the Saint-Simonian philosophy see the present Study, Part II. B, vol. i, pp. 199-200, above.—A.J.T.

leur choc répété, ils finissent par l'ébranler et par le renverser lui-même. La société alors ne présente plus que l'image d'une guerre acharnée, d'une anarchie profonde, au sein de laquelle les sentiments haineux semblent les seuls qui puissent se développer. Bientôt les esprits, effrayés de la confusion qui les frappe, ne pouvant encore apercevoir l'ordre qui doit s'établir, n'éprouvant que de répugnance pour l'ordre qui vient de périr, et dans lequel ils ne voient qu'une longue et oppressive déception, ne tardent point à arriver à cette idée que le monde est livré au désordre. . . .

'Les époques critiques se divisent en deux périodes distinctes: l'une formant le début de ces époques,¹ pendant laquelle la société, ralliée par une foi vive aux doctrines de destruction, agit de concert pour renverser l'ancienne institution religieuse et sociale; l'autre, comprenant l'intervalle qui sépare la destruction de la réédification, pendant laquelle les hommes, dégoûtés du passé et incertains de l'avenir, ne sont plus unis par aucune foi, par aucune entreprise commune. Ce que nous avons dit de l'absence de moralité aux époques critiques ne doit s'entendre que de la seconde des deux périodes qu'elles comprennent, mais non point de la première, non point des hommes qui y figurent et qui, par une sorte d'inconséquence, prêchent la haine par amour, appellent à la destruction en croyant édifier, provoquent le désordre parce qu'ils désirent l'ordre, établissent l'esclavage sur l'autel qu'ils élèvent à la liberté. Ceux-là . . . sachons les admirer, plaignons-les seulement d'avoir été soumis à la mission terrible qu'ils ont remplie avec dévouement, avec amour pour l'humanité; plaignons-les, car ils étaient nés pour aimer, et toute leur vie a été consacrée à la haine.'²

In its tragic climax Futurism expresses itself as Satanism.

'The essence of the belief is that the World Order is evil and a lie; goodness and truth are persecuted rebels. . . . The belief has been held by many Christian saints and martyrs, and notably by the author of the Apocalypse. But we should notice that it is diametrically opposed to the teaching of almost all the great moral philosophers. Plato, Aristotle and the Stoics, St. Augustine and St. Thomas Aquinas, Kant and J. S. Mill, and Comte and T. H. Green, all argue or assume that there exists in some sense a Cosmos or Divine Order; that what is good is in harmony with this order, and what is bad is in discord against it. I notice that one of the Gnostic schools³ in Hippolytus the Church Father actually defines Satan as "The Spirit who works against the Cosmic Powers":⁴ the rebel or protestant who counteracts the will of the whole, and tries to thwart the community of which he is a member.'⁵

This inevitable ultimate outcome of the spirit of revolution is

an accepted commonplace among all men and women who are not themselves revolutionaries;¹ and it is not difficult to lay our finger on historic illustrations of the working of this spiritual law.

For example, in the Syriac Society—both in its Iranian and in its Syrian wing—the Messianic form of Futurism made its first appearance as a positive attempt to follow the way of Gentleness. Instead of persisting in a disastrous attempt to maintain his political independence here and now against the assaults of Assyrian militarism, the Israelite, like the Mede, bowed his neck to a present political yoke and reconciled himself to this painful act of resignation by transferring all his political treasure to the hope of a saviour-king who was to arise and restore the fallen national kingdom at some hidden future date. When we trace out the history of this Messianic Hope in the Jewish community,² we find that it worked in favour of Gentleness for more than four hundred years—from 586 B.C., when the Jews were carried away into a Babylonish captivity by Nebuchadnezzar, until 168 B.C., when they were subjected to a Hellenizing persecution by Antiochus Epiphanes.³ The first Jewish martyrs who gave their lives for Judaism in its three-hundred-years-long struggle with Hellenism all suffered and died without offering any physical resistance. Yet the discord between a confidently expected mundane future and an excruciatingly experienced mundane present resolved itself in Violence in the end. The martyrdom of Eleazar and the Seven Brethren was followed, within two years, by the armed insurrection of Judas Maccabaeus; and the Maccabees inaugurated that long line of ever more fanatically militant Jewish Zealots—the innumerable Theudases and Judases of Galilee—whose violence reached its appalling climax in the Satanic Jewish *émeutes* of A.D. 66–70 and 115–17 and 132–5.⁴

¹ It is not surprising to find this commonplace expressed with a classic French precision—'La révolution est satanique dans son essence'—by so militant a counter-revolutionary as Joseph de Maistre. Sombart has taken the same theme as his text for a definition of 'Revolutionismus':

'I am using this term to describe a settled spiritual attitude which seeks to confer upon Luciferism a recognition in principle and an application in practice. In entering into this idea the Revolution ceases to be what it originally was—simply a means to an end—and becomes an end in itself. . . . The revolutionary *must* not concern himself with the question of shaping the Future, because that would cripple his revolutionary energy. He may not think about construction; he must devote himself exclusively to the task of sabotage.'

The writer of this Study owes both these quotations to Curtius, E. R.: *Deutscher Geist in Gefahr* (second edition: Stuttgart and Berlin 1933, Deutsche Verlags-Anstalt), p. 38.

It will be seen that, when Futurism rankles into Satanism, it defeats its own original purpose.

² For this history see further V. C (i) (d) 9 (γ), vol. vi, pp. 120–32, below.

³ See further V. C (i) (d) 9 (β), vol. vi, pp. 103–5, below.

⁴ See V. C (i) (c) 2, pp. 68 and 73, above. For the militancy into which Zoroastrianism likewise eventually fell in the Age of the Sasanidae, see II. D (v), vol. ii, p. 203; II. D (vii), vol. ii, pp. 285–7 and 374; and V. C (i) (c) 3, in the present volume, p. 216, above; and V. C (i) (c) 2, Annex I, pp. 578–9, and V. C (i) (d) 6 (δ), Annex, pp. 659–61, below.

The nemesis of Futurism, which is illustrated by this classic Jewish case, is not unfamiliar; but it is perhaps more surprising to find Archaism being overtaken by the same nemesis at the end of its own apparently opposite path; for, so far from being a commonplace, it may seem something of a paradox to suggest that a pandemonium of Violence is the inevitable outcome of this retrograde movement likewise. Nevertheless the facts of history show that our paradox is as true as our commonplace; and, in anticipation of a survey of the facts, we may point the truth by citing, here again, a single classic case.

In the history of the political disintegration of the Hellenic Society the first statesmen to take the archaistic road were the Eurypontid King Agis IV in the Lacedaemonian commonwealth and in the Roman commonwealth the Tribune of the Plebs Tiberius Gracchus;¹ and there was a singular resemblance in character, as well as in policy, between the Roman and the Spartiate reformer. They were both of them men of unusual sensitiveness and unusual gentleness; and, born (as they both were) into an age of distress and discord, they both set themselves the political task of righting a social wrong, and thereby averting a social catastrophe, through a return to what they believed to have been the ancestral constitution of the commonwealth in the already half legendary 'Golden Age' before the breakdown. Their aim was the restoration of concord and the preservation of peace; yet, because their archaistic policy was an attempt to reverse the current of social life, it inevitably led them into a course of Violence which was contrary both to their policy and to their *êthos*; and the gentleness of their spirit, which moved them to sacrifice their lives rather than go to extremes in combating the fiercer Counter-Violence which their own reluctant Violence had swiftly provoked, did not avail to arrest the avalanche of Violence which they had unintentionally set in motion. Their self-sacrifice merely inspired a successor to take up their work and seek to carry it to success by a ruthless use of the Violence in which the martyr had shown himself half-hearted. The gentle Eurypontid King Agis IV was followed by the violent Agiad King Cleomenes III; the gentle Roman Tribune Tiberius Gracchus by his violent brother Gaius. And this tragic sequence was not the end of the story; for the ruthlessness of Gaius and Cleomenes was only temporarily and superficially successful in

¹ These two historical representatives of the Hellenic dominant minority both had posthumous literary careers as heroes of 'folk-tales' which took shape in the underworld of the Hellenic internal proletariat (see V. C (ii) (a), Annex II, *passim*, in vol. vi, below). For their political careers 'in real life' see Part III. A, vol. iii, pp. 76-7; IV. C (iii) (b) 9, vol. iv, p. 205; IV. C (iii) (c) 3 (β), vol. iv, p. 508; and V. C (i) (c) 2, in the present volume, p. 78, above; and V. C (i) (d) 8 (α), vol. vi, pp. 52-3, and V. C (ii) (a), vol. vi, pp. 219-20, below.

achieving Tiberius's and Agis' frustrated purpose. In either case the successor's career merely illustrated the truth that 'all they that take the sword shall perish with the sword'¹ whether they draw it right out and lay about them, or hold it back, half-drawn, in the scabbard. The ultimate result of the violent successor's ruthless work was simply to give fresh momentum to the wave of Violence which his gentle predecessor had undesignedly set in motion. Between them, the two archaizing Heracleidae and the two archaizing Gracchi let loose a spate of Violence which did not subside² until it had swept away the whole fabric of the commonwealth which the would-be reformers had sought to save.³

Our Hellenic illustration of the fruits of Archaism and our Syriac illustration of the fruits of Futurism perhaps demonstrate, between them, our thesis that both these two variations upon the movement of transference of the field of action end invariably and inevitably in disastrous Violence; for this is their outcome even when they are set in motion by leaders who, by temperament as well as out of policy, are sincere believers in Gentleness. If we now pursue our Hellenic and our Syriac story into the next chapter, we shall find that the pandemonium of Violence which had been let loose by the cult of Archaism in the one case and of Futurism in the other was eventually allayed by an astonishing resurrection of that very spirit of Gentleness which the surging tide of Violence had overborne and submerged and silenced. In the Hellenic dominant minority the gang of conquerors and wastrels and hang-

¹ Matt. xxvi. 52. See V. C (i) (c) 2, p. 78, above; and V. C (i) (d) 8 (α), vol. vi, pp. 52-3; V. C (ii) (a), vol. vi, p. 178; and V. C (ii) (a), Annex II, vol. vi, pp. 391-2 and 527-8, below.

² For Cleomenes' ultra-violent successor Nabis and Gaius's ultra-violent successor Sulla see V. C (ii) (a), vol. vi, p. 220, below.

³ It is strange that the moral of Cleomenes' and Gaius's failure was not observed and taken to heart by Machiavelli, who searched the scriptures of Hellenic history with such diligence and such acumen for illustrations of his empirically established social 'laws'. In this case the Florentine philosopher's insight failed him; for there is a passage in *The Prince* in which he expounds the precise argument for the efficacy of Violence which was drawn by Cleomenes from the history of Agis, and by Gaius from the history of Tiberius, with such fatal consequences for the policies of both of the two 'armed prophets' of the Hellenic dominant minority who acted on this line of reasoning:

'All the armed prophets have been victorious, while the unarmed prophets have come to grief, because . . . the nature of the peoples is inconstant, and it is easy to persuade them of a thing, but difficult to hold them to that persuasion. Accordingly it is expedient to be so equipped that, when their belief gives out, one will have it in one's power to make them believe by force. Moses, Cyrus, Theseus, and Romulus would not have been able to secure the observance of their constitutions very long if they had been unarmed—as may be inferred from what happened in our own times to Brother Girolamo Savonarola, who came to grief over his new dispensation because, when the multitude began to lose belief in it, Brother Girolamo himself lacked the means of either retaining his hold upon those who had once believed or compelling belief on the part of the unbelievers. No doubt the armed prophets encounter great difficulties, and they are assailed *en route* by all the dangers of their undertaking—dangers which it is their business to overcome by their efficiency—but, when once they have overcome them, and have begun to evoke veneration, thanks to having wiped out all their inveterate detractors, they then remain puissant, secure, honoured and happy ever after.'—Machiavelli, Niccolò: *Il Principe*, chap. 6.

men who worked their will upon a distracted world during the last two centuries B.C. begot, as we have observed,¹ a breed of public servants with the conscience and the ability to organize and maintain a universal state; and at the same time the epigoni of the violent-handed archaizing reformers turned into a school of aristocratic philosophers²—Arria, Caecina Paetus, Thrasea Paetus, Seneca, Helvidius Priscus, Arulenus Rusticus, Herennius Senecio—who took no satisfaction in the exercise of their hereditary dominance even in the public interest, and who carried this abdication to the point of obediently committing suicide when the word of command was uttered by a Claudius or a Nero or a Vespasian or a Domitian. Similarly, in the Syriac wing of the Hellenic internal proletariat, the fiasco of the Hasmonaeon attempt to establish by force of arms a Messianic Kingdom in This World—in the trough between the ebbing wave of the Hellenic Power of the Seleucidae and the oncoming wave of the Hellenic Power of Rome³—was followed by the triumph of a King of the Jews whose servants were forbidden to fight because his Kingdom was not of This World,⁴ while in the next generation, on a narrower range of spiritual vision, the savagely heroic forlorn hope of the militant Zealots John of Gischala and Simon of Gerasa was retrieved, in the hour of annihilation, by the sublimely heroic non-resistance of the Rabbi Johanan ben Zakkai.⁵ How was it that, in both these cases, a tide of Violence which seemed to have swept away every barrier in its path was thus, after all, brought to a standstill and reversed? In either case the miraculous reversion from Violence to Gentleness can be traced to a change in ways of life. In the souls of the Roman fraction of the Hellenic dominant minority the ideal of Archaism had been supplanted by that of Detachment; in the souls of the Jewish fraction of the Hellenic internal proletariat the ideal of Futurism had been replaced by that of Transfiguration.

What is the nature of these two ideals, which—in the two instances in which we have just been watching them make their unexpected appearance and produce their amazing effect—are historically later arrivals upon the terrestrial scene than the ideals of Archaism and Futurism? Their posteriority in point of time would seem to bear witness to their superiority in spiritual worth; for,

¹ See V. C (i) (c) 1, pp. 38–9, above. For the corresponding breed in other dominant minorities see the same chapter, pp. 47–52, above.

² See V. C (i) (d) 3, p. 405, and V. C (ii) (a), vol. vi, p. 250, below.

³ The hard fact that the Hasmonaeans owed their ephemeral military and political success to a passing accident in the political history of the Hellenic World, and not to the strength of their own right arm, was perceived and pointed out by Tacitus (*Historiae*, Book V, chap. 8): 'Iudaei Macedonibus invalidis, Parthis nondum adultis (et Romani procul erant), sibi ipsi reges imposuere.' The explanation was as deeply humiliating for the Jewish futurists as the fact itself was momentarily fortunate for them.

⁴ John xviii. 36.

⁵ See V. C (i) (c) 2, pp. 75–6, above.

whereas we have seen Gentleness degenerating into Violence under the baneful auspices of Archaism and Futurism, we see Violence giving place again to Gentleness when the spirits of Detachment and Transfiguration begin to move upon the face of the angry waters. Perhaps we can apprehend the distinctive qualities of these two gentle ways of life in the same view as their historical geneses if we approach each of them first through the personality and the life-history of a notable convert: for example, Cato Minor the Roman archaist who became a Stoic philosopher,¹ and Simon Bar Jonas the Jewish futurist who became Peter the disciple of Jesus.² In both of these great men there was a streak of spiritual blindness which obscured their greatness by misdirecting their energies so long as they were pursuing the respective Utopias to the service of which they had first sought to dedicate themselves. And in each of them the long baffled and bewildered soul was enabled, through its conversion to a new way of life, to realize at last its highest potentialities.

As the Quixotic champion of a romantically conceived Roman *πάτριος πολιτεία* which had never existed in any past age 'in real life',³ Cato was almost a figure of fun. In the politics of a generation which he obstinately refused to take as he found it, he was perpetually chasing the shadow and missing the substance; and, when at last he stumbled into playing a leading part in a civil war for the outbreak of which he himself bore no small share of unadmitted responsibility, his political make-believe was doomed to suffer a shattering disillusionment whatever the event might be, since the régime which would have been the consequence of a Republican victory would have been at least as repugnant to Cato's archaistic ideal as the eventually victorious Caesarean dictatorship. In this dilemma, which seemed to offer Cato merely a choice between alternative roads to frustration and failure, the Quixotic politician was redeemed from ineptitude by the heroic philosopher. The man who had lived as an archaist in vain now met his death as a Stoic to such good purpose that, after all, he gave Caesar—and Caesar's successors for more than a century after him—more trouble than all the rest of the Republicans together. The story of Cato's last hours—sublimely magnificent and at the same time profoundly moving—made an impression upon his contemporaries which can be recaptured down to this day by any reader of Plutarch's narrative. With the instinct of genius

¹ For Cato Minor see further V. C (i) (d) 3, p. 405, and V. C (ii) (a), vol. vi, p. 250, below.

² Peter's conversion from the way of Violence to the way of Gentleness has been touched upon by anticipation in V. C (i) (c) 2, p. 74, above.

³ For this expression of institutional Archaism see further V. C (i) (d) 8 (α), vol. vi, pp. 52-6, below.

Caesar apprehended the gravity of the blow which had been dealt to his cause by the Stoic death of an antagonist whom he had never found it necessary to take very seriously as a live politician; and, in the midst of the titanic labour of reconstructing a world while he was stamping out the embers of a civil war, the militarily triumphant dictator found time to reply to Cato's sword with Caesar's pen—the only weapon, as this versatile genius knew well, which might avail to ward off an attack that had been transferred from the military to the philosophic plane by Cato's disconcerting gesture of turning his sword against his own breast. Yet Caesar, for all his versatility, was unable to cope with the Cato who had struck this tremendous parting stroke; and Cato's death irresistibly produced the result which Caesar had feared. It gave birth to a school of philosophic opponents of Caesarism who were inspired by their founder's example to put the new tyranny out of countenance by removing themselves, with their own hand, from a situation which they would not accept and which they could not mend.¹

As for Peter, his Futurism seemed at first as incorrigible as Cato's Archaism. The first of the disciples to hail Jesus as the Messiah,² he was also the foremost in protesting against his acknowledged Master's consequent revelation that his Messianic Kingdom was not to be a Jewish version of the Iranian world-empire of Cyrus;³ and so, having earned a special blessing as the reward for his impulsive faith, he immediately drew down upon himself a crushing rebuke for his obtuse and aggressive insistence that the Master's vision of his own kingdom must conform to the disciple's *idée fixe*.

'Get thee behind me, Satan; thou art an offence unto me. For thou savourest not the things that be of God, but those that be of men.'⁴

Satanism, in Hippolytus's meaning of the term,⁵ was indeed the essence of Peter's own untutored Messianic Hope. For, even when his error had been held up before his eyes by his Master's terrible reproof, the lesson made so little effect upon the stiff-necked disciple that he failed again under the next test. When he was chosen out to be one of the three witnesses of the Transfiguration, he immediately took the vision of Moses and Elias standing at his Master's side as the signal for the beginning of a *Befreiungskrieg*, and betrayed his prosaic misconception of what the vision meant by proposing to build on the spot the nucleus of a camp⁶ of the kind that the Theudases and Judases of Galilee were wont to

¹ See p. 390, above, and V. C (ii) (a), vol. vi, p. 250, below.

² Matt. xvi. 16 = Mark viii. 29 = Luke ix. 20.

³ Matt. xvi. 22 (= Mark viii. 32), quoted in V. C (i) (c) 2, on p. 74, above.

⁴ Matt. xvii. 23 = Mark viii. 33.

⁵ See p. 386, above.

⁶ Matt. xvii. 4 = Mark ix. 5 = Luke ix. 33.

establish in the wilderness during the brief interval of grace before the Roman authorities received intelligence of their activities and sent out a flying column of troops to disperse them. At the sound of this jarring note the vision vanished in an echo of admonition to accept the Messiah's own revelation of the Messiah's path.¹ Yet this second lesson was still not enough to open Peter's eyes. Even at the climax of his Master's earthly career—when all that the Master himself had foretold was patently coming true—the incorrigible futurist drew his sword to fight in the garden of Gethsemane;² and he was so utterly confounded by the decisive veto with which his Master quashed his instinctive recourse to Violence once again³ that he rebounded from a forlorn hope into a dastardly betrayal.⁴ Indeed, even after this crowning experience of his life, when the Crucifixion and the Resurrection and the Ascension had taught him at last that Christ's Kingdom was not of This World, Peter was still fain to believe that even in this transfigured kingdom the franchise must be restricted to the Jews, just as it would have been in the futurist's Messianic Utopia—as though a society that embraced God in Heaven as its King could be bounded on God's Earth by a frontier excluding from it all but one of the tribes of God's human creatures and children. In one of the last scenes in which Peter is displayed to us in the Acts of the Apostles, we see him characteristically protesting against the clear command which accompanied the vision of the sheet let down from Heaven.⁵ Yet Peter does not give place to Paul as the protagonist in the story until the narrative has recorded his comprehension, at last, of a truth which Paul the Pharisee had apprehended in a trice through a single overwhelming spiritual experience. The long work of Peter's enlightenment was completed when the vision on the roof was followed by the arrival of Cornelius's messengers at the gate.⁶ And in his confession of faith in Cornelius's house at Caesarea⁷ and his defence of his action there before the bar of the Jewish-Christian community upon his return to Jerusalem⁸ Peter preached the Kingdom of Heaven in words that would have drawn no reproof from the Christ.

What are these two ways of life which produced these vast spiritual effects when they were respectively adopted in place of Archaism by Cato and in place of Futurism by Peter? In peering into spiritual depths which may prove unfathomable, let us begin by taking note of the common differences between Detachment

¹ Matt. xvii. 5 = Mark ix. 7 = Luke ix. 35.

² Matt. xxvi. 51 = Mark xiv. 47 = Luke xxii. 49-50 = John xvii. 10.

³ Matt. xxvi. 52-4 = Mark xiv. 48 = Luke xxii. 51 = John xviii. 11.

⁴ Matt. xxvi. 69-75 = Mark xiv. 66-72 = Luke xxii. 54-62 = John xviii. 15-18 and 25-7.

⁷ Acts x. 34-48.

⁸ Acts xi. 1-18.

and Transfiguration on the one hand and Archaism and Futurism on the other, and then go on to examine how Detachment and Transfiguration differ from each other.

Transfiguration and Detachment alike differ from both Futurism and Archaism in substituting a genuine change in spiritual clime, and not a mere transfer in the Time-dimension, for the particular form of transference of the field of action from the Macrocosm to the Microcosm which we have found to be the criterion of the growth of a civilization. The kingdoms that are their respective goals are both of them 'otherworldly' in the sense that neither of them is an imaginary past or future state of mundane existence. This common 'otherworldliness', however, is their only point of resemblance; and in every other respect they present a contrast to one another.

The way of life which we have called 'Detachment' has been given a variety of names by various schools of adepts. From a disintegrating Hellenic World the Stoics withdrew into an 'Invulnerability' (*Ἀνάθεια*) and the Epicureans into an 'Imperturbability' (*Ἀραπαξία*). From a disintegrating Indic World the Buddhists withdrew into an 'Immutability' (*Asamskṛta*) or an 'Unruffledness' (*Nirvāna*)—a state in which the wind is hushed and the fire extinct. The positive content of the concept of *Nirvāna* is even harder to apprehend than that of its Hellenic counterparts; for the authoritative descriptions of it define it as being neither one nor other of successive pairs of opposites—for example, neither Permanence nor Annihilation—and in the Buddhist philosophy the question 'whether after death a *tathāgata* (a released person) exists or not, whether he exists and does not exist, whether he is neither existent nor non-existent', is one of those questions that are dogmatically declared to be undetermined.² A positive apprehension of the meaning of 'Detachment' is perhaps, however, not only impossible but also unnecessary; for the four names—two Greek and two Sanskrit—for this way of life which we have just cited are all of them abstract substantives with a negative prefix; and it is the negativeness of the way that is the point of it.

It is a way that leads out of This World; its goal is an asylum; and the fact that that asylum excludes This World is the feature

¹ The connotation of the Greek word *ἀνάθεια*, in its Stoic usage, is perhaps more expressively conveyed in English by the word 'invulnerability' than by the word 'apathy'; for, though 'apathy' is the etymological counterpart of *ἀνάθεια*, the Greek word has changed colour in the process of being Anglicized. 'Apathy' has come to mean an insensibility that is neither an effort nor a virtue, whereas *ἀνάθεια* means a spiritual 'invulnerability' which can be neither achieved nor maintained without the exercise of a self-discipline of an almost heroic severity.

² Thomas, E. J.: *The History of Buddhist Thought* (London 1933, Kegan Paul), p. 124. The whole of chapter 10, 'Release and Nirvana', is illuminating in the light which it throws upon the field of our present inquiry.

that makes it attractive—as the goal has to be if the philosophic traveller is to make the renunciations and subject himself to the disciplines which are the indispensable conditions for pursuing his arduous and depressing spiritual journey. The impulse that carries him along is a push of aversion and not a pull of desire. He is shaking from off his feet the dust of the City of Destruction —‘The worldling says: “O beloved City of Cecrops”; and shalt *thou* not say: “O beloved City of Zeus”?’¹—but Marcus’s ‘City of Zeus’ is not the same as Augustine’s *Civitas Dei* which is ‘the city of the Living God’,² and the journey is a ‘withdrawal according to plan’ rather than a pilgrimage inspired by faith. For the philosopher a successful escape from This World is the true and ultimate end of Man; and for this reason the philosopher, if he faces the whole of the truth, must confess that at bottom it does not really matter what he does with himself, or whether he does anything at all, or whether such a thing as his self any longer exists, when once he has crossed the threshold of his city of refuge. The Hellenic philosophers pictured the state of the liberated sage as one of blissful contemplation (*θεωρία*)³—the intellectual bliss of admiring the form of some perfect geometrical figure or ‘watching the stars go round’,⁴ or the emotional bliss of an ecstatic union with the divine element in the Universe—and the earliest and greatest of them, who was born in the first generation after the breakdown, when the iron had not yet had time to enter right into their souls,⁵ made a brave show of finding a supreme positive value in this ‘otherworldly’ condition or activity. Yet Plato himself, in the simile of the Cave, betrays a temptation to cherish the sunlit Other World for its negative value of being an *alibi* from this one;⁶ Plotinus repudiates Plato’s reluctant injunction to return from that world to this;⁷ and Siddhārtha Gautama the Buddha frankly declares that, so long as all possibility of returning has been ruled out

⁵ Plato was born *circa* 430 B.C. (i.e. on the morrow of the outbreak of the Peloponnesian War), but he lived on till *circa* 347 B.C. (i.e. to the eve of the birth of the fourth generation to be born since the catastrophe); and, though, even in his old age, he may still have remained unseared at heart, he never recovered from the shock which he had suffered in his early manhood when the disastrous ending of a twenty-seven-years-long fratricidal war had been followed by the judicial murder of Plato’s master Socrates. One effect of this shock can be observed in the archaistic antedating of the imaginary dates of Plato’s dialogues to the extent of about half a lifetime (see V. C (i) (d) 8 (γ), vol. vi, p. 79, below).

⁶ See the passages quoted from *The Republic* in III. C (ii) (b), vol. iii, pp. 249–52, above.

⁷ See the passage quoted from Monsieur Henri Bergson in III. C (ii) (b), vol. ii, p. 254, above.

once for all, the nature of the alternative state in which the *tathāgata* has come to rest is a matter of no consequence.

This unknowable and neutral *Nirvāna* or 'City of Zeus', which is the goal of the philosophic movement of Detachment, is the very antithesis of the Kingdom of Heaven or *Civitas Dei*, which is entered by way of the religious experience of Transfiguration. While the philosophic 'Other World' is in essence a world that is exclusive of ours on Earth, the divine 'Other World' transcends the earthly life of Man without ceasing to embrace it.

'And when he was demanded of the Pharisees, when the Kingdom of God should come, he answered them and said: "The Kingdom of God cometh not with observation; neither shall they say *Lo here!* or *Lo there!* for, behold, the Kingdom of God is within¹ you."²

The meaning of this passage in the Gospel according to Saint Luke may be expressed in a simile from the ever-changing landscape of the Physical Cosmos as this happens to be depicted at the moment by our Western men-of-science. We may say that the Kingdom of This World is possessed and informed by the *Civitas Dei* as Matter is said to be penetrated and shot through by Radiation. The realms are not external to one another in the dimensions of Space and Time, since only the lower of the two is confined to these dimensions, whereas the higher simultaneously occupies and transcends them—and, in virtue of this all-pervasiveness, coexists with the Kingdom of This World all the time and everywhere. Accordingly the soul that aspires to rise to the higher realm from the lower will find its way, not by seeking to reduce to zero the dimensions of its former spiritual existence, but rather by seeking 'to expand them to infinity. Just as, by the scientist's sleight of hand, the human ear that is wont to hear sounds conveyed through the medium of Matter can be attuned to catch the sounds that are conveyed by Radiation, so, by God's grace, the Soul can be made aware of the eternal omnipresence of God—a presence which per-

¹ The original Greek words ἐντός ὑμῶν may mean either 'within you' or 'among you', but this ambiguity does not affect the significance of the passage for our present purpose. On either interpretation the Kingdom of God is represented as existing in This World as well as outside it. The words would also appear to imply that the immanence of the Kingdom of God in This World, in the hearts of human beings who are its citizens, is a state of things which is present—and, indeed, perpetual. This reading of the passage is contested, however, by A. von Gall in *Βασιλεία τοῦ Θεοῦ* (Heidelberg 1926, Winter), pp. 474-5. Von Gall—taking ἐντός ὑμῶν to mean 'among you'—reads a future meaning into the present tense of the concluding sentence ('before you know where you are, you will find the Kingdom already there'), and he maintains that Jesus (as presented in this passage) agrees with the Pharisees in regarding the advent of the Kingdom as a future event (and not a present reality). According to von Gall, Jesus differs from the Pharisees merely in declaring that this future advent of the Kingdom will take the form of a sudden *fait accompli*, which will take the living generation by surprise, instead of being advertised in advance by signs and portents.—A.J.T.

² Luke xvii. 20-21.

vades This World just in virtue of transcending it—through being rapt into a supra-mundane mode of spiritual being.¹

It will be seen that the *Civitas Dei* is as positive in its nature as the 'City of Zeus' is negative, and that, whereas the way of Detachment, which leads to the 'City of Zeus', is a sheer movement of withdrawal, the way of Transfiguration, which leads to the *Civitas Dei*, is a movement of withdrawal-and-return²—though this on a different spiritual plane from any of those on which we have seen this movement taking place in the growths of civilizations.

This completes our preliminary review of the alternative ways of behaviour, feeling, and life which are opened up by that Schism in the Soul which is always to be found at the heart of the disintegration of any body social. If we are to be faithful to our well-established method, our next task will be to make an empirical survey of each of these spiritual phenomena as they have manifested themselves in the disintegrations of as many civilizations as have left a sufficiently intimate record of their 'members' experience. But before we launch out on to this ocean we may pause for a moment to take our bearings by observing the links between the history of the Soul and the history of Society.

Granting, *ex hypothesi*, that every spiritual experience must be that of some individual human being, shall we find that certain experiences, among those which we have been reviewing, are peculiar to members of certain fractions of a disintegrating society? We shall find, if we cast a glance back at our muster of experiences with this question in our minds, that all the four personal ways of behaviour and feeling—a passive *abandon* and an active self-control, a passive sense of drift and an active sense of sin—can be detected in members of the Dominant Minority and members of the Proletariat alike. On the other hand, when we come to the social ways of behaviour and feeling, we shall have to distinguish, for our present purpose, between the passive and the active pair. The two passive social phenomena—the lapse into truancy and the surrender to a sense of promiscuity—are apt to appear first in the ranks of the Proletariat and to spread from there to the ranks of the Dominant Minority, which usually succumbs to the sickness of 'proletarianization' in so far as it has not already perished through self-inflicted violence. Conversely, the two active social phenomena—the quest of martyrdom and the awakening to a sense of unity—are apt to appear first in the ranks of the Dominant

¹ For this and other similes which may perhaps imperfectly convey at least some of the aspects of the relation between This World and the *Civitas Dei*, see V. C (i) (d) 11, vol. vi, pp. 157–61, below.

² For this likeness and difference between the two movements see also III. C (ii) (b), vol. iii, pp. 248–63, above, and V. C (i) (e), vol. vi, pp. 170–1, below.

Minority and to spread from there to the ranks of the Proletariat, where Agis' gentle martyrdom is emulated by a proletarian Eleazar, and Cleomenes' violent martyrdom by a proletarian Judas Macabaeus, while the proletarian who hungers after a cosmic society finds his equivalent for a philosophic *Cosmopolis* in a religious catholicism. Finally, when we consider our four alternative ways of life, we shall find that here, conversely, the passive pair are apt to be associated in the first instance with the Dominant Minority and the active pair with the Proletariat. Archaism and Detachment make their epiphany in the ranks of the Dominant Minority; and, while Archaism finds adherents among the External Proletariat as well, it is never adopted by the Internal Proletariat, and Detachment never by either section of the Proletariat, Internal or External. On the other hand, Futurism and Transfiguration make their epiphany in the ranks of the Proletariat and propagate themselves from this starting-point—Futurism gaining converts from the Dominant Minority among the baffled and disillusioned devotees of an Archaism that has failed to bring salvation, while Transfiguration works its miracle in any human soul that awakens to the presence, and aspires to the citizenship, of the *Civitas Dei*.

From these historical associations between the several ways of behaviour, feeling, and life and the several fractions of a society in disintegration we may gain some knowledge of the relations in which the spiritual experiences and activities stand to one another. In general we can see that the passive reactions are apt to be the more barren and the active the more fruitful. For example, at one end of the scale *abandon* leads nowhere, whereas self-control is a constant element in all the virtues which the disintegrations of civilizations bring to flower; and similarly, at the other end of the scale, the life of Detachment, in which Passivity achieves its spiritual *chef d'œuvre*, is put out of countenance by the supremely active life of Transfiguration. Again, when we analyse the components of Detachment, with an eye to distinguishing the points in which it can bear comparison with Transfiguration from the points in which it reveals its inadequacy, we find that Detachment rises to the heights of Transfiguration in its readiness for martyrdom and in its conviction of sin, but is depressed to a lower spiritual level through a failure to rid itself of a clinging taint of truancy and Fatalism when it succumbs to an almost pardonable shrinking from the duty of returning to the night-bound Cave, and to an almost admirable acceptance of the inexorable laws of an impersonal Universe. Here we see two passive ways of behaviour and feeling acting as drags upon their two active counterparts; and there is a corresponding contrast between

the effects of the passive surrender to a sense of promiscuity and the active awakening to a sense of unity. A horror of the melting-pot inspires the two forlorn hopes of an Archaism and a Futurism in quest of Utopia; a yearning after a harmony that is not of This World inspires both the sublime failure of Detachment and the miraculous triumph of Transfiguration.

2. 'Abandon' and Self-Control

The particular manifestations of *abandon* and self-control which are characteristic of societies in disintegration are perhaps rather difficult to identify, just because these two ways of personal behaviour are apt to be exhibited by human beings in every variety of social circumstances. In the life of the primitive societies, for instance, in the static condition in which alone we have knowledge of it,¹ it is already possible to distinguish an orgiastic and an ascetic vein; and in this primitive life, with its cyclic rhythm, the two antithetical moods may be seen predominating in alternation with one another, according to the season, in the tribe's ceremonial corporate expression of its members' emotions. The same two moods can likewise be seen working in harmony—though this on a more intricate pattern and in a more highly sophisticated spirit—in the life of civilizations in the growth stage; and it is in this stage that their interaction is creative. It is only when we come to examine civilizations in their disintegration that we find the same two ways of personal behaviour still indeed both at work, but now at odds in an unreconciled opposition instead of playing in with one another in a creatively harmonious rotation.

In the histories of declining civilizations the phenomenon of *abandon* in our precise meaning of a way of personal behaviour is not, of course, to be confused or equated with the whole of that welter of demoralization of conduct and inversion of ranks and roles and values which is the most prominent of the outward visible signs of any process of breakdown and disintegration.² *Abandon*, as we have defined it,³ implies something more than a mere external rack and ruin. It means a state of mind in which antinomianism is accepted—consciously or unconsciously, in theory or in practice—as a substitute for creativeness.

Examples of *abandon* in this inward spiritual sense can perhaps be identified with least uncertainty if we try to take them in a

¹ See I. C (iii) (e), vol. i, pp. 179–80, and Part II. B, vol. i, pp. 190–5, above.

² See, for example, the picture of the Egyptian 'Time of Troubles' that is given in a passage, quoted above in IV. C (iii) (c) 2 (β), vol. iv, pp. 410–11, from *The Admonitions of a Prophet*; and the corresponding pictures of the Hellenic 'Time of Troubles' (in two successive phases) that are given in a passage of Thucydides quoted above in V. C (i) (c) 2, pp. 59–60, and in a passage of Polybius quoted above in IV. C (iii) (c) 3 (β), vol. iv, pp. 505–6.

³ In V. C (i) (d) 1, p. 377, above.

single synoptic view side by side with examples of that self-control which is the alternative substitute for creativeness in the same ages of social decline.

In the Hellenic 'Time of Troubles', for instance, in the first generation after the breakdown, a pair of contrasted incarnations of *abandon* and self-control are presented to us in Plato's portraits of Alcibiades and Socrates in *The Symposium* and of Thrasymachus and Socrates in *The Republic*—Alcibiades, the slave of his own passion, standing for *abandon* in practice, and Thrasymachus, the advocate of *Faustrecht*, for the same mood in theory. It is in the next chapter of the Hellenic story that we find the exponents of each of the two attempts at 'self-expression' in lieu of creation seeking an authoritative sanction for their respective ways of behaviour by claiming that these are ways of 'living according to Nature'.

This merit was claimed for the mood of *abandon* by those vulgar hedonists who took in vain, and brought into disrepute, the name of Epicurus, and who for this offence were chidden by the censure of an Epicurean poet who had inherited the genuine austerity of his Master.

Hoc etiam faciunt ubi discubuere tenentque
pocula saepe homines et inumbrant ora coronis,
ex animo ut dicant: 'Brevis hic est fructu homullis;
iam fuerit neque post unquam revocare licebit.'¹

On the other side we see the sanction of 'naturalness' being claimed for the ascetic life of self-control in the crudely literal practice of the Cynics and, with a greater refinement, by the Stoic practitioners of a kindred philosophy. In all things that were 'indifferent'—and for a Stoic nothing was either good or evil in itself except the rightness or wrongness of his own will—it was the whole duty of the sage to mortify those human desires which were accepted by the hedonist as the promptings of Nature; and to carry this mortification to a degree at which the sage became able to accept, as natural, not the impulses of the hedonist's 'natural man', but the trials, whatever they might be, that were put upon him by the chances and changes of this mortal life. The course of Nature, thus conceived, must be borne by the Stoic sage with cheerfulness if he was capable of rising to this counsel of perfection, and at all events with calmness and tranquillity if he was to be accounted worthy of being numbered at all among the disciples of Zeno.

The melancholy vein of Stoic self-control is reflected in the *Meditations* of the philosopher-emperor Marcus Aurelius, whose philosophy never could quite brace him to bear on his lonely shoulders the Atlantean load of a collapsing world.

¹ Lucretius: *De Rerum Natura*, Book III, ll. 912-15.

'The power that rules within, when it is in tune with Nature, has an attitude towards events which enables it to adapt itself easily to anything—within the limits of possibility—that is presented to it. . . .'¹

'Be like the headland against which the waves continually break; but the headland stands firm while the tormented waters sink to rest around it. . . .'²

'This infinitesimally short span of time is something to be passed through in tune with Nature and passed out of with a good grace—like an olive that falls when it is ripe with a blessing for Nature who has brought it forth and a gratitude to the tree which has borne it.'³

The temper to which the careworn Stoic emperor wistfully aspires in the last of the three sentences above quoted had been duly attained by the lame Stoic slave who had been the most conspicuous wearer of Zeno's mantle in the preceding generation.

'What else should we be doing, in public and in private, but singing the praises of the Godhead and speaking good of His name and attempting to express our thanks to Him? Digging or ploughing or eating, should we not ever be singing our hymn to God? . . . And, since most of you have gone blind, was it not meet that there should be somebody occupying this place and singing the hymn to God on behalf of us all? And what else can I, a lame old man, do but sing the praises of God? Were I a nightingale, I would sing like a nightingale; or, were I a swan, I would sing like a swan. But I happen to be a being endowed with reason, and so I must sing the praises of God. This is my work, so I am doing it, and I will never desert this post so long as it continues to be assigned to me. And I call upon the rest of you to sing the same song. . . .'⁴

'And, when Death overtakes me, I hope to be found by him practising what I preach, in order that I may be able to say to God: "Did I ever transgress Thy commandments? Did I ever use, for any other purposes than Thine, the talents or the senses or the innate ideas (*ταῖς προλήψεσιν*) that Thou gavest me? Did I ever reproach Thee? Did I ever blame Thy governance? I was sick, when that was Thy will (my fellows were sick likewise, but when I was sick, I did not rebel). By Thy will I knew poverty, but I rejoiced in it. I never bore rule, because it was never Thy will that I should; but I never desired it. Didst Thou ever see me turn sullen on that account? Was there ever an occasion on which I presented myself before Thee with other than a cheerful countenance, or without being ready for any command or signal that Thou mightest choose to give? And now it is Thy will that I should leave the festival, so I am taking my leave—with my heart full of gratitude to Thee, because Thou hast deigned to allow me to celebrate the festival with Thee and to behold Thy works and to watch the course of Thy governance. When Death overtakes me, may these

³ *Ibid.*, chap. 48.

⁴ Epictetus: *Dissertations*, Book I, chap. 16, §§ 15-16 and 19-21.

thoughts be in my mind and these words on my pen or on the page that my eyes are reading."¹

Such was the ascetic mastery over Nature that was attained, in the course of the disintegration of the Hellenic Society, by the noblest adepts of the Stoic school of philosophy. And in the final chapter of Hellenic history we can see the ascetic tradition of an expiring dominant minority blending with the less negative asceticism of the proletariat when the Hellenic philosophy, in its Neoplatonic close and climax, rises to a pitch of mystical feeling at which its dying song of praise to God comes almost into unison with the younger and stronger voice of Christianity.²

If we pass from the Hellenic to the Syriac World in its 'Time of Troubles', we shall find the same unreconciled opposition between *abandon* and self-control reappearing in the contrast between the sedately sceptical theory of the Book of Ecclesiastes and the piously ascetic practice of the monastic community of the Essenes. And in another field again, in the philosophic strife of the Sinic 'Time of Troubles', we shall see Yang Chu suffering Epicurus's fate of being exploited by hedonists³ and at the same time castigated by moral disciplinarians who in the Sinic case were of the Confucian and Mencian school. Similarly, in a latter-day 'Time of Troubles' in Japan which preceded the enforcement of the peace of the Tokugawa Shogunate, the same antithesis reveals itself again in the clash between the abandoned immorality of the Japanese high politics of the age⁴ and the almost inhumanly perfect self-dedication of the contemporary samurai to his feudal lord.

There is another group of civilizations—the Indic, the Babylonian, the Hittite, and the Mayan—which seem, as they disintegrate, to be reverting to the *êthos* of Primitive Man in their apparent insensibility to the yawning breadth of the gulf between the abandoned sexualism of their religion and the exaggerated asceticism

¹ Epictetus, *op. cit.*, Book III, chap. 5, §§ 7-11. The second of the two passages here quoted reappears in Book IV, chap. 10, §§ 14-17, in the following variant:

'If, after this, Death overtakes me, it is sufficient for me if I am able to lift up my hands to God and say: "I have not neglected the talents that I received from Thee in order that I might perceive Thy governance and follow it. I have not disgraced Thee as far as it lay within me. Behold how I have used my senses and my innate ideas (*ταῖς προλήψεσιν*). Did I ever blame Thee? Did I ever take badly anything that happened, or wish that it had happened in some other way? Did I ever transgress the laws of my nature (*μή τι τὰς σχέσεις παρέβην*)? Because Thou hast begotten me, I am grateful for what Thou hast given me. So long as I have been using that which is Thine, it has sufficed for me. Now take back that which is Thine own and assign it to whatever place Thou wilt. For everything was Thine; it was Thou that gavest me all that I had. Should one not be content to depart in this frame of mind? Or is there any better or fairer life, or happier death, than a life and death like these?"

² For this momentary *rapprochement* between Hellenic philosophy and Christianity see further V. C (i) (d) 6 (δ), pp. 550-3, below.

³ For these Sinic hedonists see Waley, A.: *The Way and its Power: A Study of the Tao Tê Ching and its Place in Chinese Thought* (London 1934, Allen & Unwin), pp. 39-43.

⁴ See V. C (i) (c) 2, pp. 95-103, above, and V. C (ii) (b), vol. vi, pp. 303-5, below.

of their philosophy. In the Indic (which is the classic) case there is a contradiction which at first sight looks insoluble between lingam-worship and yoga; and we are similarly shocked by the corresponding contrasts between the temple-prostitution and the astral philosophy of a disintegrating Babylonian Society, between the human sacrifices and the penitential self-mortifications¹ of the Mayas, and between the orgiastic and the ascetic aspects of the Hittite worship of Cybele and Attis. Perhaps it was the common vein of sadistic extravagance which entered into their practice of *abandon* and their practice of self-control alike that maintained, in the souls of the members of all these four civilizations in their decadence, an emotional harmony between practices which seem to defy reconciliation when they are observed with the coldly analytic eye of an alien spectator.

If we turn, in conclusion, to the history of our own Western Society, our attention will be caught first by the clash of *abandon* with asceticism in the disintegration of the medieval Italian city-state cosmos. In fifteenth-century Florence the Thrasymachean political theory of Machiavelli and the Epicurean social practice of the Medicean circle were confronted by the puritanical religious fervour of Savonarola;² and in sixteenth-century Lombardy Rodolfo Gonzaga supplied the foil—a murky halo—for his brother Aluigi within the bosom of a single family.³

Are the two conflicting ways of behaviour now re-performing their play upon the broader stage of our Western Society in the modern chapter of its history? There is no lack of evidence for the resurgence of *abandon*; for in the domain of theory it has found its prophet in Jean-Jacques Rousseau with his alluring invitation to 'return to Nature',⁴ while, for the practice of *abandon* by the living generation of Western and Westernized men and women, in Europe and overseas, *si monumentum requiris circumspice*. On the other hand we may still search in vain for traces of a counter-resurgence of asceticism, and may perhaps tentatively draw from this negative evidence the cynical conclusion (which may comfort us or leave us unconsoled, according to the nature of the faith by which we live) that, if our Western Civilization has indeed already broken down in its Modern Age, its disintegration cannot yet be very far advanced.

¹ For these see Gann, T., and Thompson, J. E.: *The History of the Maya* (London 1931, Scribner), p. 143.

² Machiavelli's own consciousness of this antithesis is attested by the passage from *The Prince* which has been quoted in V. C (i) (d) 1, on p. 389, footnote 3, above.

³ See V. C (i) (c) 1, pp. 40 and 48, above.

⁴ Rousseau's outlook is taken as a psychological symptom of social disintegration by Oswald Spengler in *Der Untergang des Abendlandes*, vol. i (Munich 1920, Beck), p. 487. Besides being a gesture of *abandon*, it is also an expression of archaistic-mindedness (see V. C (i) (d) 8 (a), vol. vi, pp. 58–9, below).

3. *Truancy and Martyrdom*

If, in our survey of truancy and martyrdom, we follow the same comparative method that we have just been employing in our survey of *abandon* and self-control, we shall find, if we again address ourselves to Hellenic history first, that the contrast between these two ways of social behaviour which are alternative substitutes for the expedient of mimesis comes out repeatedly in successive stages of the Hellenic Society's decline and fall.

In the first generation after the breakdown the truancy of the Attic slaves who ran away from their masters to find asylum within the enemy lines at Decelea in the second act of the Atheno-Peloponnesian War provides a foil for the martyrdom of the Athenian citizen Socrates, who refused to elude a death-sentence by condescending either to abscond from the prison where he was awaiting trial or to prevaricate at the trial when this duly took place¹—though, in the judgement of most of Socrates' own friends and admirers, either of these ways of playing truant would have seemed far less blameworthy than the 'get-away' of the miner-slaves from the *ergastula* at Laurium. In the contemporary Lacedaemonian camp the moral truancy of Gylippus, which ended in his ignominious exile,² was as truly an outcome of the 'beginning of great evils for Hellas' in 431 B.C. as was the vindication of the Spartiate military tradition by Brasidas through the giving of a heroic example which ended in the hero's glorious death.

Some two centuries later, when the fate of the Hellenic World was once more 'on the razor's edge' between the first rally after the original breakdown and the first relapse,³ both Athens and Sparta played truant, at the critical moment, from the common cause of federalism, though the championship of this cause offered the only hope of saving the independence of the historic states at the heart of the Hellenic World now that these had been dwarfed and overshadowed by a ring of giant states on the periphery which the expansion of a disintegrating Hellenism had latterly called into existence.⁴ The Spartan statesman who was perhaps more responsible than any other man of his day for this second blighting of the prospects of the city-states of Greece was King Cleomenes III; and this self-same Cleomenes was one of the two members of the pair of Spartan martyr-kings who gave Sparta her last sunset

¹ For Socrates' repeated and persistent refusals to accept the various loopholes for escaping death which were almost officiously opened for his benefit, see Plato's *Crito*, *Apology*, and *Phaedo*, *passim*, and also the present study, V. C (ii) (a), Annex II, vol. vi, pp. 490-2, below.

² See Part III. A, vol. iii, p. 70, above.

³ See V. C (ii) (b), vol. vi, pp. 287-9, below.

⁴ See III. C (ii) (b), vol. iii, p. 341, footnote 1, and IV. C (iii) (c) 2 (α), vol. iv, pp. 265 and 268, above.

glow of glory¹ and at the same time transmitted to the internal proletariat of the Hellenic Society as a whole an inspiration which can perhaps be detected, in the fullness of time, in one aspect of the spirit of Christianity.²

In the course of the subsequent relapse³ the antithetic roles of truant and martyr were replayed both on the Roman and on the Syrian section of a Hellenic arena which had now been enlarged to the dimensions of a colosseum. The Gylippan demoralization of the majority of the young men of the Roman governing class in the generation that came to manhood after 'the crowning mercy' of Pydna—when the overthrow of the last surviving rival Great Power within range of Rome had suddenly relaxed a tension under which every Roman of that class had been living, with scarcely a respite, ever since the beginning of the Hannibalic War a full half-century back—was an example of mass-truancy which threw into all the sharper relief the unrotted virtue of a Scipio Aemilianus⁴ and the clear-eyed self-sacrifice of the Gracchi: a pair of Roman martyrs who retrod, step for step, the *via dolorosa* which had been trodden before them, a hundred years earlier,⁵ by the Spartan pair of Heracleidae.⁶ As for the submerged Syriac wing of the Hellenic internal proletariat, it was the years immediately following the definitive establishment, at Pydna, of Rome's supremacy in the Hellenic World that witnessed in Judaea the parting of the ways between the truancy of the Hellenizing Jewish High Priest Jason⁷ and the martyrdom of Eleazar and the Seven Brethren in response to the challenge of Antiochus Epiphanes' policy of forcible Hellenization.⁸

In the last bout of the Roman civil wars, which marks the transition from the first relapse of a disintegrating Hellenic Society to its second rally, the martyrdom of Cato Minor finds its antithesis in the truancy of Mark Antony; and, if the inspiration of Cato's example can be discerned in the deaths of a series of Roman aristocrats who likewise gave their lives for the republican ideal in the course of the next century,⁹ the spirit of Antony's craven and futile flight from a nightmare which was inescapable, because it was a true reflexion of his own defeated soul, has been expressed

⁹ For this effect of Cato's example see V. C (i) (d) 1, pp. 390 and 392, above, and V. C (ii) (a), vol. vi, p. 250, below.

with an insidiously imaginative sympathy by the freedman-poet Horace in the sixteenth poem of his Book of Epodes.

Altera iam teritur bellis civilibus aetas,
 suis et ipsa Roma viribus ruit:
 quam neque finitimi valuerunt perdere Marsi
 minacis aut Etrusca Porsennae manus
 aemula nec virtus Capuae, nec Spartacus acer
 novisque rebus infidelis Allobrox,
 nec fera caerulea domuit Germania pube
 parentibusque abominatus Hannibal—
 impia perdemus devoti sanguinis aetas
 ferisque rursus occupabitur solum.

.....

Forte quid expediat communiter aut melior pars
 malis carere quaeritis laboribus;
 nulla sit hac potior sententia: Phocaeorum
 velut profugit execrata civitas
 agros atque Lares patrios, habitandaque fana
 apris reliquit et rapacibus lupis,
 ire pedes quocumque ferent, quocumque per undas
 Notus vocabit aut protervus Africus.

.....

Nos manet Oceanus circumvagus: arva, beata
 petamus arva divites, et insulas,
 reddit ubi Cererem tellus inarata quotannis
 et imputata floret usque vinea.

.....

Juppiter illa piaae secrevit litora genti,
 ut inquinavit aere tempus aureum—
 aere, dehinc ferro duravit saecula, quorum
 piis secunda vate me datur fuga.¹

In the 'escapism' of this Horatian conceit of a 'get-away' from an irreparably ruined real world to the Utopia of some Lotus Eaters' Land or Calypso's Isle² the truancy of the Hellenic dominant minority comes to its dramatic climax at the same moment as the Hellenic 'Time of Troubles'; but the denouement is staved off by the successful establishment of a Hellenic universal state; and we have to sit expectantly until the passage of two centuries has brought us within sight of the bankruptcy of the Roman Peace before we again see the antithetic roles of truant and martyr being played on the Hellenic stage by eminent pairs of mutually antipathetic performers. On the Imperial Throne in the gathering gloom of the outgoing decades of the second century of the Christian Era we behold in the person of Marcus a prince whose

¹ Horace: *Epodon Liber*, carmen xvi, ll. 1-10, 15-22, 41-4, 63-6.

² For the temptations of Odysseus see II D (i), vol. ii, pp. 22-4, above.

title to the martyr's crown is not invalidated, but is on the contrary confirmed, by Death's refusal to cut this martyr's ordeal short by any *coup de grâce*; while in Marcus's son and successor Commodus we are presented with the spectacle of an Imperial truant who makes scarcely an effort to shoulder the burden of his heritage before he turns tail and is off, in headlong moral flight, along the sordid cinder-track of 'proletarianization'.¹ In the next generation after Commodus's we see the contrast between Marcus and his unworthy son being displayed once again, on the same Imperial Throne, by a pair of cousins who both wear the now hallowed Antonine name as a transparent cloak over their notorious Syrian provenance. While Elagabalus dies by violence in retribution for his truancy in neglecting the strenuous duties of a Roman Emperor in a time of crisis in order to indulge—under the aegis of a Roman Peace that can now no longer be taken for granted—in the lascivious relaxations of a High Priest of the Baal of Emesa,² Alexander Severus dies the same death as a martyr to his intrepid attempt to carry out—with the self-sacrificing public spirit of his predecessor and ensample Marcus—the alien, uncongenial, and unpromising task of restoring the antique discipline of the Roman Army.

This ill-assorted pair of Syrian recruits is the last conspicuous entry on our roll of truants and martyrs from the Hellenic dominant minority; for the social class in which the Hellenic culture had hitherto been preserved and handed down, in defiance of the spirit of an age of disintegration, as a continuous and a vital tradition, was almost annihilated in the terrible relapse into the downward path into which the Hellenic World was precipitated by the assassination of Alexander Severus.³ On the other hand the two generations—one of unbridled anarchy and another of ruthless reconstruction—which elapsed between the death of Alexander in A.D. 235 and the death of Galerius in A.D. 311 were signalized by a classic exhibition of both martyrdom and truancy in the ranks of a Christian Church which had been expanding from its original standing ground in the Syriac section of the Hellenic internal proletariat until it had won converts, and put forth branches, in every province of the Hellenic universal state.⁴

¹ For this phenomenon of 'proletarianization' see further V. C (i) (d) 6 (α), pp. 439–80, below.

² For Elagabalus's religion and religious policy see V. C (i) (c) 2, p. 82, footnote 4, above, and V. C (i) (d) 6 (δ), Annex, pp. 649 and 685–8, below.

³ For this relapse see IV. C (i), vol. iv, p. 8, and V. C (i) (c) 3, in the present volume, p. 219, above, and V. C (i) (d) 6 (δ), Annex, in the present volume, p. 649, and V. C (ii) (δ), vol. vi, pp. 284 and 291, below.

⁴ The Church's unanimity-in-ubiquity had already been proclaimed in the second century of the Christian Era, before the end of the Antonine 'Indian Summer' of Hellenic history, by the Christian Father Saint Irenaeus of Lyon:

'Having received this gospel and this faith, as we have already related, the Church, in spite of her dispersal throughout the World, preserves these treasures as meticulously

The Christian Church was the principal target for the parting strokes of a Hellenic dominant minority which turned savage in its death-agony;¹ for this dying pagan ruling class refused to face the heart-rending truth that it was itself the author of its own downfall and destruction; even *in articulo mortis* it tried to salvage a last shred of self-respect by persuading itself that it was perishing as the victim of a dastardly assault on the part of the proletariat;² and, since the external proletariat was now marshalled in formidable barbarian war-bands which were able for the most part to defy or elude the Imperial Government's attempts at retaliation for their galling raids, the brunt fell upon the Christian Church, which was the master-institution of the internal proletariat and at the same time was not, as the barbarians were, beyond the physical reach of the dominant minority's now distractedly vindictive arm.³ Under the test of this ordeal the sheep in the Christian fold were divided unequivocally from the goats by the challenge of being called upon to make the tremendous choice between renouncing their faith and sacrificing their lives. The renegades were legion—indeed, their numbers were so great that the problem of how to deal with them became the burning question of ecclesiastical politics as soon as the persecutions came to an end—but the tiny band of martyrs was spiritually potent out of all proportion to its
